THE SHIP OF SHADOWS.

By JOHN FOSTER, Author of *The Bernardine*, *The Forgotten Rock*, &c.

CHAPTER I.—SOLWAY SANDS.

NEAR the tip of a sunburnt finger of the Solway Sands an old Galloway country-house stands cresting a heugh—the Galloway vernacular for a sea-cliff—unscreened by so much as a single tree, naked to every blast that blows.

What the house is like, what its name is, where it exactly stands, whether between Dee and Cree, in Stewartry or Shire, are of little concern with this tale. Enough to say that it is now a long, rambling shooting-box; that from the hall-door one can see, not seldom through mist, the tops of Sreel, Bengairn, and old Criffel—their names are as virile as their shoulders!—and that at every falling of the dusk, St Bees' light across the Firth blinks compassionably towards it from canny Cumberland.

Looking southward through its diamond panes, the eye (given a clear summer day) may trace far out on the jewelled floor of the sea a faint pencilling marking the Isle of Man. Nearer, the blue peaks of Skiddaw, Scafell, and their comrade hills, guardians of the dales, keep watch on the English coast. Breaking the middle distance sparkles a line of silver-blue, the chain-mail of the Solway when the swift squadrons of her tide charge up the Firth. At the ebb, the fugitive sea, unrolling a magic carpet shot with red and gold, with russet brown, with glowing splashes of lemon, lays bare the wide stretch of sand to bask in the sun, its great curve narrowing down to a tawny border of rocks all laced with seaweed, in the little bay at the heugh's foot.

Behind the house rises a rampart of hills, hard-featured, ill-fringed with rough grass and heather, pitted with dour granite seams, raggedness in its contour, tenanted only by a few moor-fed sheep and the shy birds that love solitary places, rugged and boulder-strewn, yet with a character and presence of its own, of a pattern with the lonely seaboard parish that it watches and crowns.

Not beautiful, perhaps, this tiny notch in the coastline of Old Scotland; but to me, a wanderer, a dear and friendly memory, for no one—an he would—shall escape from the glamour of his boyhood's environment. Dull city square, quiet of stately woods, a mean, clamorous street, an island-od of turf floating in the Atlantic—if one

of these but spells home and youth, the call of the blood is towards it; a trifle—the scent of the hay, a song-bird's rhapsody, a long-forgotten 'accent' holding the heart for an elusive moment—and a man's thoughts on some sudden rainbow of memory bridge the leagues and the lost years. At least so it is with me, Francis Herries, for I am a Galloway man. If I sit down by the rivers of Babylon, be sure that I have a vision of the 'channel' of the Nith and the purple glow on Criffel. Wherefore the old house on the shore, far off the beaten track, haunted by piping sea-fowl and the voice of the tide, is a lodestone of memory. For there I dreamed and dreamed, and nursed the secret, sensitive thoughts of a boy.

A delectable corner this for a long-legged boy to quest and range around in! For were there not the heughs, dangerous and beckoning, starred with yellow tansy, rich in strange birds' nests and eggs on uncanny ledges; enchanted caves where the echo of one's voice boomed round the roof like a giant's, startling the blue-rocks to a sudden whirl of wings; musical burns with plump brown trout in them; blaeberries in secret green gussets of the hills; mysterious black hill-tarns, drops of ink in the heather! The place was a boy's El Dorado of imaginings. Romance clothed it like its heather mantle. Covenanters lurked among the rocks, dragoons passing within a yard of them; bright-eyed brownies peered, popping in and out of the bracken; the caves held treasure-trove, contraband silks and kegs of brandy, hunted Jacobites, smugglers, pirates; all the gallant and inspiring phantoms of youthful dreams.

All healthy boys, I think, are more or less Romanticists, so it came about that my cousin and I soon enrolled the urchins of the village hard by under our banner of high adventure. Of my cousin more anon, but I was by consent dreamer-in-chief to the gang. I remember a huge tree lying where it had fallen after a gale, across a burn on the hillside. With the limitless resource of youth, we would make it serve one day as a castle with a portcullis, moat, pit and gallows, complete; another time it would be a sailing-ship, a long branch of it the yard-arm, where miserable captives (of course off the Spanish Main) 'walked the plank'—into the burn; or

DECEMBER 7, 1912.

[All Rights Reserved.]

it was the dizzy main-truck, the acrobatic lookout spying the Jolly Roger running up twenty times a day; or there the lone chief of the Blackfeet, sated with the single-handed slaying of buffaloes, would pensively await at his wigwam the return at eve of his braves, bearing many 'pale-face' scalps—that is, turnips, and, like kisses, the more theftuously obtained the better. And if we tired of the hills, there was always the mystery of the sea, the welcome call of the ebb and flow of the tide, inviting and close at hand.

A giant's thumb-mark carpeted with green turf near a heugh's brink was my favourite lair; and there, the fresh wind singing round me, I would lie by the hour, spyglass in hand, picking up the ships beating up the Firth, or watching the blue distances and the smoke rising from the towns on the English side. Once, greatly daring, I dipped the flag in front of the house to a gunboat on survey close inshore, and, to my joy, the Queen's ship made stately answer. I strutted and put on airs for a week after this marked honour. But there were not very many craft about, for the ports on the Scottish side of the Firth are small. However, this was merely a whetstone to my zeal. The ships I did see were in imagination promptly hauled-to, boarded, rechristened, put about, and their prows set for the Isles—alas! now lost—the Isles of Make-Believe. What though they bore the humdrum, registered Board of Trade names of the *New Importer*, the *Mochrum Lass*, or the *Jane and Elizabeth of Maryport*, and their cargoes were of prosaic huckster stuff like salt or oilcake? To me their tarry crews were Argonauts, their gray sails the wings of Romance, glittering and authentic. They were purple-sailed, with the tiger-stripes of Carthage. They were beaked triremes shining with the shields and helmets of old Rome. One I would fancy a lonely straggler from the Armada, a great Cross on her mainsail, a haughty Castilian looking down from her high, carved stern; another, bold Yawkin's lugger running before the wind with a rich cargo of French brandy, and the revenue cutter astern; or I would conjure up the pale ghost of Paul Jones at the wheel, abeam of the shore road under the lee of Criffel, hard by where he was born; or a gallant old 'seventy-four,' her white ensign on the wind, the fifes of the Marines shrilling, drums beating to quarters, and the seas creaming white in her wake.

Ay de mi! oftentimes since then, under burning suns, over the estranging seas, I have ached for a sight of the Solway shore and the sweet, wet tang of her southerly gales.

CHAPTER II.—'THE AYRESHIRE ROSE.'

ONE notable morning stands out clear against the background of those boyish days.

My cousin Hugh, four years my senior, for distinguished conduct in the turnip-fields as dog-

leader and game-bag carrier, had been presented with a rook-rifle, and in the first delighted flush of his new dignity unbent so far as to extend to me his patronage.

'Would you like to come with me to the loch to-morrow, kid?' said he. 'I'm going to try a cast, and if the fish aren't rising I'll practise with the rook-rifle at a target. I've spoken to my guv'nor, and it'll be all right.'

He added carelessly that I could look after the luncheon-basket, and exercise Glen and Topsy, two of the dogs, to keep me, I supposed, in my place, lest I might harbour wild dreams of being allowed to fire a shot. I accepted my honour meekly but promptly, in case he should show signs of revoking.

'But you won't be allowed to go if the weather is at all bad. Be up at half-past five, for we have a long drive to the loch,' he concluded, and continued a wholly unnecessary scrutiny of his brand-new lethal weapon. I prayed for fine weather twice that evening, and woke up four times to peer through the window.

Alas! next morning, when I rose and feverishly scanned the weather signs, my hopes sank, for a veil of mist hovered and lifted, and lifted and hovered, between a leaden sky and a leaden sea. I dressed hurriedly, and met my cousin with a blithe front but a sinking heart.

'I think the weather is going to clear, Hugh,' quoth I glily.

'Bluff! Not much!' was the terse reply. 'You're not coming. That's flat!'

It was flat—as flat, I thought with a gulp, as being told off to learn the Shorter Catechism or weed the garden, my two most dreaded 'fatigue' duties. But there was no help for it. In gloomy silence I watched him drive off, hoping that no one would notice that I was 'near the greetin'.

But mark the sure law of compensation working towards the comfort of crestfallen youth. I had turned towards the sea, and stood glowering at the thin curtain of the mist and the shadows marshalling, dissolving, taking form and shape again. The morning was windless; but in a short time I was like to be wet to the skin, for with the flow of the tide a soft rain was falling so quietly as to be scarcely audible against lattice and roof. The tide was stealing up without a ripple and almost without a sound. There was an uncanny quiet in the trailing mists and the secretive voice of the sea as it crept surely and swiftly on its way. The weather, too, was unlike the uncompromising rain of the Solway, the morning more like one of the tear-stained West Highlands, where, hardly conscious of the suggestion of a shower, one suddenly discovers that the crafty weather, silently, without haste, without rest, has filled the burns and veiled the hills.

Shivering, I made up my mind to go down to the shore to see the salmon stake-nets fished,

and ran briskly for warmth along the sheep-track that winds along the crest of the heugh. A short-cut, with the charm of danger in it, trailed down the scarred face of the Gled's Rock, a steep ladder of boulders and loose stones that sloped gradually to the sands two hundred feet below. I started to clamber down it. I was as active as a goat, and knew every inch of the way. About half-way down, on a handy ledge, I stopped to take a breath for a minute or two, when I fancied that I heard a hail. I strained my ears to catch a sound, but there was nothing but the cautious answering calls of the whaups and the thin bleat of the distant sheep. Suddenly the sound arose again, unmistakable, inexpressibly beseeching and mournful, the long-drawn howl of a dog. It came from the west, on my right from where I stood. A minute or more sped, and again the sound arose. I would have paid but little heed, for wandering dogs in the parish were common enough, until suddenly it was borne in upon me that the sound came from the sea.

I listened. Down on the shore, about two hundred yards below the house, looking as mean and treacherous in the gray morning as the hand of a wrecker, a long dagger of rock narrowed down to a point that sheathed itself in the sand. The mists were clearing a little, and I could just make out its sombre outline, when the sound arose again yet nearer, and it seemed to me from beyond the little promontory. Just then a half-bearded streak of sun pierced the haze, and, to my amazement, I thought that I caught a glimpse of the spars and sails of a ship peering over the rock's ridge. I say I was amazed, for it was little short of miraculous for a ship of any draught to have been so close inshore unless driven there by stress of weather. Even a small sailing-boat required delicate handling among the sands and currents. But there was no wind, and the flow of the tide was so calm that scarcely a whisper of it reached me. The thing was inexplicable. It might have been a mirage. I rubbed my eyes, and even as I did so the sun took heart, the mist parted swiftly like a torn curtain, and there, rounding the point, was a fore-and-aft schooner, boom-foresail and standing jib set, a light-green hull with a broad white band on it, coming tardily, listlessly, head on, straight to the shallows a hundred and fifty feet below the ledge on the cliff where I stood. I obeyed my first instinct, gave a loud, warning 'Ahoy!' and signalled frantically to her to stand off. For all answer came again the long, dolorous call of the dog and the shrill cries of the startled sea-fowl around me.

The schooner was now so near that I could hear the groaning of her tackle and the faint wash of the feathering water at her bows. I shouted again; and, as if at the sound of my voice, she swung round a point or two, and lumbered forward, just grazing a half-covered rock.

I knew little of seamanahip, but it was plain even to me that she was being grossly mishandled. She would make a hurried little run of a dozen yards, then hang for a moment motionless and undecided, for all the world like a masterless dog. Then she would yaw, to run forward again as a faint breath of wind touched her, always with a curious hesitation, blundering in her tracks like a blind thing.

'Hallo, laddie!' A voice hailed me from the heugh's foot. I looked down.

It was one of the coastguard from the Lot's Wife Station, eastward. I had been too busy staring at the schooner to notice him before. He beckoned to me, and I came down the heugh's face with all speed, the loosened stones rattling and jumping down before me in my hurry. Soon I stood beside the coastguard, one Tam M'Kinnell. He wiped his wet red beard, and gazed, a puzzled frown on his weather-tanned face, at the wreck.

'I've seen mony a temptin' o' Providence,' said he, 'but never as daft a business as this. It coves a'.' He stared hard again at the ship.

An ugly sandbank ran eastward from the stake-nets. Luckily for the schooner, the tide was nearly at the brim, and even as it was she must have had two or three narrow shaves over hidden rocks. On she lumbered slowly foot by foot, her sails scarcely drawing, until she was abeam of the seaward 'pocket' of the salmon-nets, holding on unsteadily on her strange, blind course, until it almost seemed that if she fetched a point or two she might be carried to comparative safety out in the 'channel' by the tide. But this was not to be. The sea's sure warrant was out for her arrest.

'She's no' bein' sailed. May I never have stood my trick at a wheel if she's bein' steered! Her crew's either asleep or drunk or deid.' Thus Tam, spyglass at eye.

'What's her name, Tam?' I asked.

'Hold on! I'm just on to it.'

He spelled out the letters: 'T-h-e A-y-r-s-h-i-r-e R-R— *The Ayrshire Rose*. I dinna ken her.'

He handed me the glass, and I read the name picked out in green letters on the white band on her hull. There was a rude sketch of a flower above the name, the little, wholesome rose that one sees all over the south-west of Scotland in village gardens, cool white clusters in the sun, fairy lamps in the summer dusk.

By this time *The Ayrshire Rose* was about a couple of hundred yards out, making a little way in the height of the tide. Suddenly, as if waking, she yawed again, her unhandled tiller veering like a vane, and then came straight at us.

'She'll never shake a reef oot again! Another meenit an' she's bedded,' cried the coastguard; and the homely word chimed exactly with what happened. There was no sudden shock, no cry from her timbers. She lolled along for a few

seconds, took the sandbank three-quarters on, and heeled gently over to starboard, her masts at an angle of about forty-five. 'Bedded' she was. I thought of her as of some faithful animal, tired after a long, hard day, lying down thankfully to sleep. Her futile sails drooping listlessly, there she lay, settling inch by inch into the comfortable ooze, her bows on a great pillow of sand.

'Just as snug as if she was cuddlin' the Broomielaw,' quoth the coastguard.

CHAPTER III.—STRANDED.

THE mists had melted, the drizzling rain ceased, and the morning broke clear. From where we stood we could pick out every detail, from the tiller to the white figurehead of a woman. But there was no sign of life on board other than the almost human note of despair of the dog and the inquisitive gulls mewing and mewing round and round the masts.

A couple of the salmon-net fishers joined us, and together we waited for the ebb. Already the brimming gray-blue of the sea had lessened. A curve of wet sand glistened in the early sun, the tide ebbing as swiftly and silently as it had carried *The Ayrshire Rose* to her last berth.

Soon we were able to read the figures on the watermarks on her stem, and waded out to where she lay like a great, stricken seabird, her wings picked out like snow against the wet, dark sand. She had slipped off the sandbank a little as the ebb caught her, and now lay heavily canted to starboard. One of the salmon-fishers 'made a back' for the coastguard, and Tam swung up by the bobstays as actively as an ape, lowered a rope-ladder, and in a trice we were all on the slanting deck, my heart in a flutter of expectancy and adventure. The coastguard looked round with a sailor's comprehending eye.

'All ship-shape and Bristol fashion! Um! Welsh, or maybe fra the English Channel. She's no' Scotch at ony rate, for she's got a tiller,' said he, as we began a tour of inspection. Any dreams I might have had of Captain Kidd or *The Bounty* soon vanished. I had scented a romance (a failing or a habit that I have never shaken off), and I felt a little douche of disappointment, for there were no signs of mutiny, piracy, or even stress of weather. The ship mocked my hopes in its order and reticence.

The planking on the decks was swabbed clean to spotlessness. Her brasswork shone like a battleship's. Wherever she came from, there were no traces of *The Ayrshire Rose* having made heavy weather of it. Her spars and yards looked trig and sound. The ropes were curled neatly on the after-hatch; sails, other than the two in use, all stowed; life-buoys, with her name on them, lashed in their places. Everything was orderly except where a bucket and a hen-coop, with a couple of excited fowls clucking under it, had slid down to the scuppers when the

schooner heeled over. The very pots and pans in the galley were in their places, and some potatoes, ready peeled for boiling, hung there in a net. What was significant, her port and starboard lights were burning, and a red glow shone in the ashes of the dying galley-fire. There was no boat. So far the deck.

We stood for a moment in puzzled silence, until the coastguard gave a loud 'Ahoy!' From below came the voice of the dog, this time in a sharp, inquiring bark. He had heard us. Tam led the way, the search-party following his red head as it disappeared down the companion. The cabin-door opened easily, and out bounced a sable collie, a handsome beast, with white-stockinged forelegs and a beautiful eye. He sniffed round us delightedly, vastly interested; and, having given us as polite a welcome as his haste warranted, rushed off and searched, whining for his master, all over the ship. But he found no one, and neither did we.

The little state-room was empty. The cabin was empty. The forecabin and the bunks were empty. We took off the hatches. The hold held but a ballast of stones. The cabin was spick-and-span with newly painted bulkheads and excellent fittings, and a clock swinging from a hook ticked busily, marking the exact time—seven minutes past seven. A medicine-chest in the stern locker was rummaged by Tam—successfully, it appeared, for he discovered a whisky-bottle more than half-full. He uncorked and smelled it, the two others watching him. It was an anxious moment. A pause, then 'Muzzle not the ox when he treadeth out the corn,' said he, his eye a-twinkle, and the three men swiftly went through the ritual of the 'drum'—'Ma respec's,' a gulp, a deep breath; and the search was begun again.

A few well-thumbed books—*Norie's Epitome* and a Waverley Novel or two—but with no owner's name, stood on a shelf in the tiny state-room; and we found some good clothes laid past both aft and forward, these also with neither makers' nor owners' names marked on them. The signal-flags, with a Union-jack and a red ensign, were found, but no burgee. A thorough overhaul was made for her credentials. There were no lockfast receptacles. They all opened easily, but were surprisingly bare of information. We found nothing—ship's papers, log, Board of Trade certificates, letters, not so much as the scrape of a pen. The after-part of the combing of the hatchway was new, and without the ship's official number. But for her name and her port of registry on her stern—*The Ayrshire Rose, Glasgow*—the ship was as silent concerning herself as the new barnacles on her hull.

'I dinna like the repairs where her number should ha'e been,' said Tam, his brows puckered, after we had thoroughly examined her. 'Levanted, I doot! But they have dune it decently an' in order, as the minister says.

Weel, weel, I'll mount a watch, an' send word to Dumfries, an' they can mak' a kirk or a mill o' her. I'll tak' the hens for my bother.'

He suited the act to the word, and we dropped over the side to the sand. I was sent back for the dog. He point-blank refused to desert, and it required a rope and much cajoling to get him off. Eventually I succeeded (and kept the good beast for years); but the most of his first week ashore was spent in staring at the schooner as dejectedly as any old 'shell-back' at the wreck of his ship.

We turned to go, the coastguard halting to take a last look at her.

'Bide a wee,' said he, 'till I close her een. She minds me o' an auld ship o' my ain. Poor lass! she'll never move again.'

He went to the port and starboard lights, now burning low, and put them out. There was the sadness of finality in the little incident; the end of something, a good-bye, and to strangers—a last breath. None of us spoke. For the moment I think I could have lifted my glengarry.

The coastguard was right when he said that *The Ayrshire Rose* had made her last port. She never left the clutch of the sands.

Of her voyage, her owner, master, or crew, no traces were found till years afterwards; and, to add to the mystery, it came out that no ship of the

name of *The Ayrshire Rose* was on the register, or had ever been known at Glasgow or elsewhere. She was a masquerader, and her history for some time remained a blank. A Clyde-bound tramp had passed a schooner, green-hulled with a white stripe, apparently all trim aloft and aloft, sails set heading east with a fair wind. This was on the evening before the stranding. Probably that schooner was *The Ayrshire Rose*; but it was by no means certain, and beyond this crumb of conjecture nothing was heard of her for long. So in the official archives there stood for many a day the meagre record of how a well-found ship, unidentified, with evidence on board her of having been recently manned—witness the fire and the lights—with no signs on her of any peril of the sea, had sailed up the Solway, and stranded in fair weather, without a living soul on board.

The Receiver of Wrecks soon dismantled her, and there she lay on the threshing-floor of the sands for years, her gallant back broken, a silent hulk, keeping her secret; to my boyish fancy as nameless and unknown as though phantom hands had held the tiller and steered her there from the misty leaguer of an underworld; naked to many a blazing sun, many a winter sea to charge over her, shouting, *Doomed! doomed! doomed!*

(To be continued.)

ANCESTRAL MEMORY AND DREAMS.

By M. M'INTYRE WILSON.

[T is now some years since a curious and interesting article appeared in one of the English monthlies, written (if I remember rightly) by the Rev. J. Forbes Phillips, and dealing, under the title of 'Ancestral Memory,' with a common but disconcerting human experience. We all know, more or less, the feeling, when something is happening, that we are experiencing it now not for the first time, that we have seen a thing or known a person on some previous occasion; yet on reflection we cannot recover more than this feeling of familiarity.

As a rule the sensation is vague and evasive, a memory struggling to the surface and escaping before we can capture or define it; but sometimes it is distinct and lasting.

The explanation usually offered is that of previous existence—reincarnation, in fact. Of this we have a fascinating study in Kipling's *Galley Slave* and Lester Arnold's *Phra the Physician*; but many of us repel the bare idea, feeling it to be incompatible with almost any form of Christianity. The author of the article in question, however, meets us with a fresh notion. He argues that, as we undoubtedly inherit our physical features, habits of mind, tricks of manner, as well as constitutional tendencies, from our forebears, we can also inherit, more or less decidedly, fragments of our

ancestors' memories. More emphatically would this be so in districts like the Scottish Highlands, where families and clans have held together for centuries, intermarrying at frequent intervals, till various threads of memory become interwoven into an intelligible whole.

Now, it may be objected that as we have by this time some thousands—nay, millions—of ancestors, those memories must not only be infinite in number, but so faint and confused as to be incapable of even momentary disentanglement; yet as it is possible for a physical feature to emerge, after centuries have passed, practically identical with that of some distant progenitor, so if the right note were struck there might be a sympathetic vibration along those usually dormant memories.

To many it may appear that the memory is more connected with the soul than with the body, with the personal identity on which the Christian faith seems to insist, and that in another state of being we shall 'wake and remember and understand'; yet, again, it must be admitted that memory has a physical aspect as well. It may be impaired by illness; it may be disordered or destroyed by a violent mental or nervous shock. Certainly physical sensations have the power to awaken it, and in their turn respond to its call. There are few things more potent than the sense

of smell to arouse vivid mental pictures of the past.

If memory, then, were 'heritable property,' one would expect to find it strongest in those families where responsiveness to impressions and retentive memory have been handed down from father to son; but people are so shy of alluding to these uncanny experiences that it is exceedingly difficult to obtain proof on this point.

As has been said already, this sensation of recollection, or semi-recollection, varies greatly in definiteness and in length of duration. Usually it is gone almost before we can put the feeling—not always a pleasant feeling—into words. On one occasion, within my own knowledge, a party of friends were talking together, while one of the ladies stood silent, listening, when suddenly I noticed she was staring at a man near her with an extraordinary expression of pleased surprise and recognition. She told me afterwards that she had been for an instant on the point of 'remembering *who he was*,' but that the recollection faded as suddenly as it had come. An example of the more lasting type is offered in the case of a little, hard-headed, hard-working friend of mine, who, on going for the first time to visit one of our small east-coast towns, found it so perfectly familiar that she not only could find her way about, but knew instinctively where every street and road led to, and what she should find at the end of it.

I cannot but feel that in this direction must lie the explanation of that most interesting little book, *An Adventure* (Macmillan, 1911), which presents an apparently inexplicable psychical problem. The solution tentatively offered by the joint-authors is the least convincing part of the book, but it appears to me that 'ancestral memory' would meet the situation at practically every point. The authors are apparently unaware that a namesake of one of them was prominent in Paris during the Revolution, and it is not impossible that an ancestor of the other was employed about the Trianon at the same time. This would solve the difficulty of the two experiences, double, yet not identical.

That one of his ancestors had been a Roman soldier Mr Forbes Phillips felt convinced on account of a singular flash of memory which occurred to him while he was visiting a Roman camp in Italy, and which enabled him to identify places and reconstruct the military life of those times, yet vanished in an instant and left his mind a blank on the subject. Another cleric wrote to say that he too had a Roman connection, as he had a clear recollection of riding with a company across the moors of ancient Britain.

My own experience is confined to two occasions on which a spot in a landscape roused a vague yet powerful memory, connected with the seventeenth century; but so painful and un-

pleasant was the sensation that absolute terror destroyed the vision just as it was becoming clear. I realised enough to make me feel that my ancestor was a soldier, probably a trooper, about 1680, more especially as similar impressions persistently haunt my dreams. I dreamed once that I was a young non-commissioned officer in the old Scottish Life Guards, engaged in escorting a powder-wagon from Stirling Castle to Bathgate; and not only the country, but the details of the route followed, were surprisingly vivid and convincing. At the time Bathgate as a destination seemed to me a *reductio ad absurdum*; but I have since discovered accidentally that about 1675 a company of the Life Guards was actually quartered at Bathgate!

The mention of my dreams, however, opens up the subject considerably. Is it not possible that those extremely clear and vivid visions of people and places (certainly unknown to our waking hours) which visit us in dreams may also be fragments of the ancestral past?

Dreams are not always a farrago of nonsense, a pot-pourri, as it were, of our waking thoughts; there are occasionally a coherence and a choice of incident not to be explained by our everyday lives. The books we have been reading are sometimes the source of inspiration, but not always; they cannot supply us with that certain knowledge of sensation or emotion which, waking, we have never felt.

It does not fall to the lot of the average modern girl to witness a hanging; yet once, many years ago, I did—in a dream—and with the most horrible realism. It happened in the course of a surprisingly coherent and consistent narrative, lasting through many chapters, with a complete plot, *dramatis personæ*, and setting, and some of the incidents stand out now in my mind as vividly as any actual fact of my life. Never can I forget the absolute paralysis of terror which held me, as my own heroine, rooted to the pathway of the ancient walled garden, while a group of infuriated villagers strung up a shrieking wretch (my servant, though an unprofitable one) to the branch of a plane-tree, till, thrusting my fingers into my ears to shut out the fearful screams, I fled to the old mansion-house, and locked myself, shaking, into my own room.

It would seem that the broken fragments of past facts which form the fabric of our dreams might, by some accident, be thrown together into something approaching their original form, as the chips of glass in a kaleidoscope may, by a chance turn of the hand, change from confusion into a geometrical design.

To this order, too, may belong the constantly recurring dream which lasts throughout a lifetime. A friend of mine searches continually in her dreams for a small room or closet which she never by any possibility can find; yet it is always the same, and has been ever since she can

remember, no matter when or where the dream has occurred.

Again, comparing notes with another dreamer, I found that she and I dreamt practically the same dream, which comes at intervals and repeats the same incidents more or less exactly. Although this lady and I are not in any way related, and do not resemble each other either mentally or physically, yet the order of the incidents in each case is so exactly similar as to suggest a common origin for the dream, a common ancestry for the dreamers! Certain it is we both trace back our families on one side to the same district of the West Highlands.

This idea of a common origin has been most beautifully enlarged upon in George du Maurier's masterpiece, *Peter Ibbetson*—a book too little

known—in which the hero and heroine, descended from twin-sisters, find a meeting-place in the land of dreams. Not the vicissitudes of life, not the bolts and bars of a prison, not even death itself, can keep Peter Ibbetson and Mary Séraaskier from each other's society or from the strange and wonderful past which they share in common, and which they haunt hand-in-hand.

It would be the work of a lifetime to follow out this fascinating subject, but the way is beset with difficulties. People are so shy of these uncanny experiences that they hide them away even from their own sight, and only unearth them on rare occasions—even then shamefacedly. If the fear of being unorthodox, and even heretical, were removed, it is probable we should have some most interesting revelations.

A CASE OF NERVES.

By THEODORA WILSON WILSON, Author of *Moll o' the Toll Bar*, &c.

CHAPTER I.

'AFTER such a very lucidly expressed opinion, Charlie, our argument closes—naturally!' Louie hoped that she was making some impression at last, and she looked ostentatiously at her watch. Then, as silence ensued, she rose from the rough oaken seat in the shrubbery, and became intent upon arranging her soft slouch-hat at an exactly becoming angle amongst her bright, springy hair.

'If the argument is closed, nothing now remains save the decision.' The young man had also risen. Charlie Mason stood six feet under the measure; but just now he stooped a little, as he steadfastly regarded his fiancée's aggressive shoulder. His tone was hard and terse, and he called her 'Louie' instead of the familiar 'Lou.' These points she noticed reluctantly.

'The decision is simplicity itself,' she said with a smartly assumed carelessness. 'If I understand this extraordinary outburst aright, it is your deliberate opinion that I am robbing you in some mysterious manner of your share of a bargain which you allege I have struck. I never give you time, I am so busy, so restless, so selfish; in short, I am a cheat at a game I never understood, and you are keen to throw it up. I quite admit that it amounts to a tragedy that I should have wasted so much of your valuable time.'

Charlie Mason thrust out a foot as though his one object were to shake down his carefully creased flannels. Yet his hands were clenched, and he knew that his lip was bleeding. 'Louie,'—the tone startled her into turning her head, and for a moment he captured her eyes—'that is a most dishonest tirade, and you know it!' he pronounced hotly.

She answered his passion by a smile altogether

maddening, yet a deep pink flooded her cheeks. 'Your pronouncements, Charlie, carry with them exactly the weight they deserve.'

So she left him, and hurried along the moss-grown path which led into the park, and thence out towards the village.

'How absolutely tiresome Charlie is growing!' she thought. 'He used to be such fun, but he is becoming positively little better than an exigeanite old woman. As if in the twentieth century the whole duty of woman, even though she does happen to be engaged, is to lounge round after a man! Thank goodness this is the last week of Charlie's visit! He really does interrupt my work too distractingly.' Then she heaved a tremendous sigh, and rushed on still quicker.

'Of course, now that I have shown him his place, I shall be thoroughly nice to him,' she mused. 'I'll give him an hour to-morrow with his flute if he likes.'

Again she looked at her watch, yet she could hardly walk faster. As she reached the village one and another nodded and smiled at her, for Miss Louie was a general favourite on account of her wit, her kindness, her generosity, her sparkling initiative. Miss Louie was 'in' everything, and without her affairs became suddenly flat and pointless. Just now her talent was the talk of the county. A September pageant and carnival, first mooted in the village schoolroom, had now grown and developed under the energetic fostering of the squire's daughter and housekeeper until it had become not only a county but a well-nigh national event. In her swiftly conceiving brain she had worked out the whole scheme, and her enthusiasm had brought eager workers to her command. True, her scenes and costumes might appear to an expert to be inaccurate, but to the

ignorant general public they seemed amazingly clever. 'It is the general effect we want to arrive at,' she would say to cavillers.

At this instant she was hurrying to catch the school children to drill them in morris-dancing, careless of afternoon tea, a pile of unanswered letters, and the decoration of the table for a dinner-party that night.

The children greeted her with beaming countenances, keen to follow her cool, clear instructions; and they watched her with delight as she danced the steps before them and inflamed their enthusiasm through the fire of her own eager personality.

The lesson over, she hurried away, with a party of adoring children trailing behind her to the park gates. With a farewell nod, she escaped; and, with youth on her side, and spurred onward by her inexorable watch, she ran a few paces. Then suddenly she slackened. Had she known it, her face was white and her eyes had dulled. Still, it was not necessary that they should sparkle for the mere edification of the Alderney cows or the heavily leaved beeches which sent a cool wind to her damp brow. Only when a great hound careered down the drive towards her her manner changed, and she welcomed him and caressed him vivaciously.

Arriving indoors, she went to her room to attack her day's letters. She tore them open and answered them with quick decision. 'Louie Holland always answers her letters by return,' so said one of her admirers. 'She is quite the most capable girl in the county,' said another.

Yet, as the time fled forward, it appeared that Louie was going to be late with the flowers after all. But no! she was in the dining-room pealing the bell, and in another moment was giving directions to a stammering man-servant, new to his duties.

Having done all to her satisfaction, she glanced into the empty drawing-room to note the grim silence of the dressing-hour, and escaped to her room and her now anxious maid. The frock was new, and Miss Holland had not even tried it on. Hence the anxiety.

But Louie's luck followed her, and she was safely dressed and downstairs, coolly wandering round the conservatory, before her father appeared or the first of the expected guests arrived.

Mr Holland, a widower of some years' standing, adored his daughter and believed in her to the uttermost. At times the incessant rush in the house oppressed him, for he was essentially nervous, and absorbed himself in leisurely country occupations. He would have been satisfied with a much less active environment than his daughter provided for him; but he was proud of the county admiration, and he supposed that life had changed since his father's time. Girls could not be expected to sit on cushions and sew seams when sewing-machines were so cheap. Sports, tennis, golf, hockey, votes, politics, dancing,

bridge—girls were untiringly diligent at them all. Life was growing most uncomfortably marvellous, yet he was proud that his own daughter appeared to be the most marvellous part of it.

But to-night there was a shadow on his thin, fallow countenance. 'Little girl'—so he used his usual intimate term—'by all that's foolish, what have you done with Charlie?'

'Charlie!' The hint of blame flushed her cheek and brought the light to her eyes. 'Shown him his place, and not before it was time.'

'His place!' murmured the squire. 'You have driven from you one of the finest boys God ever made.'

'Nonsense!' Though her whole being was startled, she still had nerve enough not to betray her surprise. She waited for more.

'Louie, are you mad? Are all these things you do really worth the loss of a good man's heart? When Charlie wished me good-bye he explained things like the gentleman he is. But I am sorry. I thought that I had found a son.'

The girl shrank involuntarily from the look in her father's eyes, for the sorrow of his life had been the death of his one boy. Louie had prided herself that she had wholly filled the void; and, lo! the abyss was still gaping.

But the door opened and visitors entered. The young hostess greeted each and all with small-talk admirable in its suitability and vivacity.

At table Charlie was missed, and his absence was the first topic of conversation.

'He has had news which sent him off suddenly,' said the squire from the foot of the table.

'Horrid luck, isn't it?' acquiesced the young hostess to her neighbours; and she received their condolences with bright eyes and radiant cheeks.

Then the talk passed naturally to the pageant, and Louie proved herself an able *raconteuse*, as she gave smart, humorous sketches of the villagers, who were so consumed with their own importance at the characters which she had designed for them.

After dinner they settled down comfortably for bridge, and it was very late when Louie at last passed to her room.

Somehow she and her father did not wait for their usual chat after the guests' departure, and from his own room the squire heard the rustle of his daughter's skirt as she crossed the passage.

The lines of worry in his face deepened. Louie was a little fool, and he had spoiled her. If only his wife— He glanced up at the quiet eyes of the portrait, behind the lamp, of a woman, little more than a girl, who had been killed across a fence, 'for all the world to see.' She would have understood this daughter, and she would have aided him in the stupendous task of guiding a woman safely through the portals of life. And now a duty to which he felt himself wholly unequal overwhelmed him. Yet was he to let this woman's daughter, the child she had

nestled against her heart, bring herself to disaster through his own weak *laissez-faire* and his want of pluck or moral force to grasp the nettle?

That Louie was her mother repeated was not the fact. He knew well enough that, together with her mother's physical well-being, Louie had also inherited his own high-strung temperament. He had sufficient perception to realise that his daughter was seeking to lead the ample life of her mother's strong physical powerfulness, handicapped by his own nervous weakness. He had never seen it so clearly as on this evening, when with enlightened eyes he had watched her forced brilliance.

How he had rejoiced when Charlie Mason, the keen, sensible, humorous young engineer, had found his way not only to the Hall, but, as he had hoped, into the very centre of Louie's being before she was old enough fully to realise herself as a woman of presence, power, and wealth!

Yet that afternoon how clearly young Mason had spoken! 'Mr Holland,' he had said as he gripped the squire's hand at parting, 'what is the use of saying things? What is, is! If I worry and torment her hourly now, there can be no possible future for us. I have sufficient perception to understand the hint she gave me, and God give me pluck to take it—that is all!'

'But, Charlie'—the squire groaned.

'Please don't!' Charlie returned with white lips. 'Only—tell her I am sorry I ever bothered her.' There was no hint of blame to his daughter, only a complete decision in the man's tone which the squire was bound both to respect and accept.

And now, at midnight, as the squire recalled, point by point, little things he had noticed during this most uncomfortable fortnight, he gave a great sigh, rose, called a dog, and went out for a walk.

His daughter heard his step on the gravel, and watched him through her lattice. Now that the silence of the night had fallen, she was putting off the evil hour of a hot bed and an uneasy pillow by lingering over her toilet and watching the moon and the clouds weave shadows in the park.

'How absurd people are!' So she kept repeating over and over, in order to force herself into believing it. And yet, why had she not found out what Charlie had really said to her father? Her father was pacing the garden outside. He alone knew what Charlie had said. She did not know. As if it mattered!

She thrust the blind across, making the rings scream on the rod. She stared in the long mirror at her dressing-gowned self. She blew out the mirror-candles fiercely, and groped her way to bed.

Her flushed cheek set the cool pillow burning. Her eyes refused to close, and stared persistently into a room dimly living through the moonlight which besieged the blind. Thought flooded and refused control, and a bewildering panic sickened her spirit. A fierce illumination centred forth in

true focus the rightness of Charlie's stupendous indictment. She flung off the bedclothes and lighted a candle.

Lately she had rejected the common habit of sleeping at night, and, as often before, she forced aching eyes to read till dawn. Then she blew out the light and fell into an uneasy slumber till the arrival of her morning tea.

It was with relief that she rose. She hated the night, for was it not a mere interruption to the business of life? A cold bath would put her right with herself; and, however tired she felt, and however full the house was of guests, she never failed her father at their private breakfast.

Charlie had recently taken to intruding upon them; but to-day there was no Charlie. Silly boy! As soon as she had done her housekeeping she would write him a charming letter which would bring him back apologising.

Yet on this particular morning she was shy of her father. When he entered the room she was busy over the coffee, and she looked so entirely her usual self that the magnetism of her presence brought a smile to his eyes.

'Good-morning, little girl!' and he kissed her with an affection which she returned.

Yet as they chatted over their letters Louie was shrewd enough to realise that her father's talk was perfunctory. Under ordinary circumstances she would have rallied him on his gravity and said insistently, 'Well, dad, why in the grumps?' But just now she could not.

When at last he set down his empty cup there was an instant's pause, and then he jerked out, 'How would it be, Louie, if you and I took a trot up to town before our next invasion of guests? I rather want to do one or two things, and we could go to the play at night—anywhere you chose.'

Louie was startled. Her father was not in the habit of suggesting London. That was one of the drawbacks to her existence.

'Of course I should love it,' she began; 'but I have a pageant committee this afternoon, and a lot of girls coming later on about costumes, and—oh, fifty things!'

'Put 'em all off!' said the squire. 'One day can't make any difference. If we catch the two o'clock we can get to the "Cecil" comfortably for dinner.'

'But how long do you propose to stay?' Louie queried undecidedly.

'Oh, we can come back to-morrow, I suppose,' he said lightly. 'Unless you find you want a longer dose.'

Perhaps the long night and a repentant compunction made the squire's task easier. At least, his daughter was persuaded to his will.

Afterwards he took a long walk far out of her reach. 'I am a brute—an absolute brute!' he groaned.

(To be continued.)

SIR WILLIAM ARROL THE WORLD'S GREATEST BRIDGE-BUILDER.

By JAMES H. YOUNG.

IT is not every day that a firm—even a firm enjoying a world-wide reputation—can boast of securing two orders which in the aggregate represent five years' work to the men employed upon them. This, however, is just what has happened to the great engineering firm of which Sir William Arrol is the head and front. One order is for the caissons in connection with the naval dockyard at Rosyth, and the other for a large lifting-bridge over the river Trent at Keadby.

The universal fame which this renowned Glasgow firm has won for itself in the engineering world is a tribute to the sterling quality of the work which it produces, and to those wonderful bridge-building achievements which have made the name of Sir William Arrol second to none in the profession which he so conspicuously adorns. Indeed, had Sir William lived a century earlier he would have been crowned king of the mechanical geniuses of Great Britain by that indefatigable prose-poet of the engineers, Dr Samuel Smiles. As it is, his life-work forms an illuminating example of the value of self-help, of grit, and of refusal to submit to defeat under even the most trying and adverse circumstances. Sheer ability and persistent effort have raised him from the humblest beginnings to the highest position in his profession; and, without fortune or favour, without influence or luck, he has indelibly stamped his genius and personality upon some of the most wonderful engineering achievements in the world.

Born over seventy years ago in the little Renfrewshire village of Houston, the future builder of bridges was not allowed the advantage of an extensive scholastic education. His father was a cotton-spinner, and at the tender age of nine young Arrol was taken from school in order that he might help to add to the family income as a bread-winner. He began as a cotton-piecer in a mill. Two years later found him in a bobbin-turning factory, and at the age of fourteen he attained his heart's desire by being apprenticed to a blacksmith and engineer in Paisley. It was here he obtained his first knowledge of engineering; it was here also, on his own confession, that for a time his most important duty was to 'sing sheep's heids for the neighbors.' But the young apprentice was out for something better than this; and, as a stepping-stone to higher things, he eagerly applied himself to the improvement of his education while serving his apprenticeship.

Apprenticeship days over, and thirsting for more craft-knowledge, he set out for what the Germans call his 'wander-year.' He wandered to some purpose; and in the workshops to which

his skill and strength gained him admittance he more than paid his way. Back again in Glasgow, in his twenty-fourth year he was made foreman in the yard of a local firm of ironfounders and bridge-builders.

The years rolled on, and in 1868 William Arrol stood on the threshold of what for him was a momentous venture—he determined to start business for himself. His savings amounted to eighty-five pounds—not a large sum, by any means, wherewith to launch his boat on the wide sea of individual enterprise. But he was pluck personified, ambitious for the higher rungs of the ladder, and confident in his ability to 'get there.' Modest indeed was the initial effort, an insignificant shop situated in the midst of green fields that are now covered with colossal factories and busy streets. 'For some time after I started business,' he says, 'I, along with one man, commenced work at five o'clock every morning, and went about as if there were enormous contracts to finish.' As a matter of irrefutable fact, the man who was destined to write his name large upon the engineering history of the world was at this particular period passing through a crisis which tested him to the very uttermost. Never did man carry a braver heart through a more trying time. For a year or two he never knew from week to week how much longer he could keep a modest roof over the heads of himself and his devoted young wife, whom, with characteristic daring, he had married a few years earlier. 'I should not like to tell the story of those years of struggle and privation,' he has said; 'it would be too painful.'

But the days of small things—of the making of boilers, girders, and general structural work—were drawing to a close. Fortune, which he had wooed so bravely and patiently, at last smiled upon his efforts. Instead of having to seek for orders, as at first, orders began to seek him. His business gradually developed until he was compelled to remove to more commodious premises, and the Dalmarnock Ironworks were the result. Any doubt about the turn in the tide vanished entirely when his first tender for a bridge—boilermaking had hitherto been his forte—was accepted; this, too, against formidable rivals. The contract was for a viaduct across the Clyde at Bothwell, and the plan adopted by the young engineer was at once novel and effective. Departing from the orthodox method, he built his bridge on the bank, and rolled it out, span by span and from pier to pier, across the river. As the work advanced it became increasingly evident that the new bridgemaker had found his true vocation; and

so satisfied was the railway company with the expert manner in which the contract was carried out that Mr Arrol was commissioned to build another bridge over the Clyde at the Broomielaw.

A different style of bridge was required here, and he produced a different plan. To meet the requirements of his new idea he devised tools such as no engineer before had ever dreamed of. A drilling-machine was the first of these, and then a hydraulic riveter. As one writer has aptly said, 'These tools opened up a new vista of possibilities to engineers. He made them simply because he wanted to tackle bigger problems than other men had grasped, and did not realise the greatness of the idea which his hard thinking had evolved. But other engineers did; they clamoured for tools like them, and he suddenly realised that here were unsuspected potentialities of wealth. He patented the ideas, and found fortune coming to him by a side-path. A patent drawer-and-stoker for gas-furnaces was added to his name, and was successful; and very soon he found himself a manufacturer of tools and appliances wholly new to science.'

A huge pontoon for the sinking and building of piers for bridges across water was another of his inventions. This was fitted with four massive legs, which, when the pontoon was in position, were let down and fixed in the bed of the river, thus imparting extra stability to the pontoon, and lifting it clear of the water. To the lay mind it sounds exceedingly simple, but it was new to engineering, and was to be of immense utility in the big undertakings to come, for which the erstwhile blacksmith was unconsciously equipping himself. The first of these was the Forth Bridge, the contract for which was placed with the intrepid subject of our sketch. The original design for this stupendous undertaking was the handiwork of the late Sir Thomas Bouch, the engineer of the ill-fated Tay Bridge. In the preliminary preparations, and in the erection of workshops for the structure which was to cross the Forth, Mr Arrol had already spent a considerable sum of money, when disaster, in the shape of the dreadful Tay Bridge catastrophe (in which about eighty lives were lost), compelled a pause; Sir Thomas's scheme afterwards being abandoned. This terrible calamity was a staggering blow to all concerned in the erection of the bridge; but the man was at hand who was soon to redeem the prestige of the engineers and restore the shattered confidence of the public.

Mr Arrol was entrusted with the rebuilding of the Tay Bridge. It was an opportunity for a display of his engineering genius which the ambitious bridgemaker eagerly welcomed. A rigorous examination revealed the old foundations to be insecure, and it was decided to build an entirely new bridge a short distance farther up the river. Within five years from its commencement—1882 to 1887—a remarkable erec-

tion, over two miles long, and constructed at a cost of seven hundred and fifty thousand pounds, spanned the estuary, a structure strong enough to defy the fiercest gale that ever blew. It was the greatest engineering triumph of the age, until it was eclipsed by a greater—the Forth Bridge.

Not the least of the extraordinary feats accomplished by this redoubtable bridge-builder was the fact that at one and the same time he carried on two such gigantic contracts as the Tay and the Forth Bridges. It was a striking tribute to his great powers of organisation and to his genius for engineering on a mammoth scale. The construction of the Tay Bridge was only half-finished when he made a start with the gigantic undertaking which now spans the Firth of Forth, from the designs of Sir John Fowler and Sir Benjamin Baker. The design adopted was that technically known as the cantilever and central span, which it was confidently expected would overcome the many peculiar difficulties that confronted the engineers. Over a year was spent in the preliminary preparations alone—the designing and making of special plant, the erection of workshops on shore, and the thousand and one things essential to the success of such a huge scheme.

The cost of temporary plant ran to half-a-million sterling, and included thirty steam and other barges, tugs, launches, and boats, sixty steam cranes and winches, fifty hydraulic cranes, forty-eight steam-engines, and hydraulic jacks, hand-cranks, and drilling-machines almost innumerable; not to mention one million cubic feet of timber and sixty miles of wire.

Adequately to tell the story of this bridge's wonders and how these were wrought would require the technical vocabulary of an engineer. It is hopelessly impossible for any one not versed in the technicalities of engineering comprehensively to grasp the magnitude of the task represented in the construction of the Forth Bridge. The difficulties actual and potential were stupendous. Where one was overcome two others rose in its place. The natural physical obstacles as they presented themselves to the eye were enough to appal the stoutest heart. As they came to be tackled, and the conflict between nature and the engineer came to be developed, the resolute, dauntless Scotsman found himself committed to a task equivalent to the building of ten bridges.

The enormous nature of this engineering wonder of the world may be gathered from the following figures: The total length is over a mile and a half, and consists of two main spans, each nearly a third of a mile long; two spans of six hundred and seventy-five feet each; and fifteen of one hundred and sixty-eight feet each. In the piers there are about one hundred and twenty thousand cubic yards of masonry, and in the superstructure over forty thousand tons of steel and some fifteen thousand tons of iron, the latter metal being used only as a part of the founda-

tions. It took six years to build, with an army of seldom less than five thousand men daily employed upon it; and the total cost in labour and material exceeded three million pounds. Of tremendous strength, and awe-inspiring in its sublime, massive dignity, the heaviest load upon it can never reach one-half the power of resistance which the bridge affords; and, so far as the records of science go, there has never been a hurricane in the history of the world which could challenge its stability.

Never was there a worthier recipient of the honour of knighthood than the builder of this titanic triumph of engineering, an honour which Queen Victoria conferred upon him, and which brought Sir William—modest and unexcited, as usual—felicitations from all over the world.

Other notable achievements at home and abroad have since become monuments to the great gifts—unique gifts, one might truly say—possessed by the world-famous builder of bridges, such as the Tower Bridge, the widening of Blackfriars Bridge, bridges over the Nile, the novel transporter-bridge over the Mersey, and other constructions of a similar nature in different parts of the world. That remarkable metropolitan highway, the Tower Bridge, in many respects the most novel bridge in Great Britain, is the structure by which Londoners are best able to judge of the rare craftsmanship of Sir William Arrol. One cannot overestimate the immense utility to Londoners of the Tower Bridge in establishing a safe and commodious means of communication between the two sides of the river, where the population is vast and the traffic increasing.

The two latest contracts secured by this celebrated Glasgow firm are both of the uncommon order. The bridge over the river Trent near Keadby is designed to carry the metals of the Great Central Railway. It will supersede a swing-bridge which has been in use for many years; but in addition to serving the purposes of the railway company, it will afford facilities for vehicular traffic and foot-passengers. There will be an opening-span of one hundred and sixty feet, which will enable the barge traffic on the river to pass beneath without interruption. Of the four spans in all, the lifting-span will weigh two thousand seven hundred and seventy tons, and will be operated by electric motors. Further, the

span will be mechanically and electrically interlocked with the railway-signals. The bridge, it is anticipated, will take two years to build, and when completed it will be the largest and heaviest lifting-bridge in Great Britain. Contract number two is an Admiralty order for the whole of the caissons in connection with the naval dockyard at Rosyth. There are seven caissons in all, six of the sliding type, and one a ship type. The order is considered to be one of the biggest of its kind ever placed with any firm, and it is expected to take three years to complete.

What of the personality of the man who dominates Arrol's Limited—the modern Cyclops whose strenuous career is now drawing to a close? It has been well said that in Sir William Arrol you see a strong man, of fine, matured strength upon a rugged foundation. We look instinctively upon the self-made man, the bold contractor, the eyes and ears of the designing engineer, who has fought his way upwards, for whom rough homespun is still dress sufficient. You see in him a sturdy Scot, without the grace of club or West End mansion, with the appearance of a farmer minus the leggings, with his face hardened to the weather, and with the stern, unbending expression of the Covenanter of old. Shrewd and practical in all things, he is yet possessed of a most sympathetic and generous nature, and in him these qualities take a very real and tangible form, to the comfort and advantage of many. Quite unspoilt by fame and fortune, he is as simple and as accessible to-day as when, long years ago, he 'sing'd sheep's heids for the neighbors.'

The reconstruction of his firm a number of years ago secured for the knight-engineer the necessary leisure to devote to the scientific, political, and philanthropic work in which he is interested. But it is at his 'ain fireside,' as it were, in his beautiful house at Seafeld, near Ayr, that one sees Sir William at his best. A lover of the fine arts, he has gathered together a choice collection of beautiful pictures and other interesting curios, and amid such surroundings it is a delight beyond telling to spend a quiet evening with the distinguished host. It is then that one may study his strong personality and understand those hidden forces which have carried him from obscurity to pre-eminence, which converted the humble blacksmith into the greatest bridge-builder in the world.

IT IS TIME TO GO ABROAD.

By LADY NAPIER of Magdala.

THE curious unrest, the craze for wintering abroad, was upon them. Their home was full of charm, of comfort. The quiet days were drawing in, gray and still; leaves were rustling softly to the ground; the garden was being tidied and put to bed. Robins were singing their little

songs; bold as brass, they would superintend digging operations, perching sometimes on the spade as it paused in its labours for a moment, peering with round, bright eyes where the earth looked rich and hopeful as to worms. The mournful cry of the golden plover and the wail

of the curlew echoed on the hill, and the strange note of the wild geese streaming high overhead to the shores of lonely islands far out at sea had already been heard more than once. All was lovely and peaceful, and a great hush brooded over the land. What though a winter gale would sweep down now and again, shrieking and wild, beating furiously on the old gray house? The walls were thick; the windows did not rattle; peat-fires glowed with gentle warmth on the hearth; comfort reigned within. Comfortable old servants did their duties with satisfaction to themselves and their employer; the days slipped quietly by.

It was, however, time to go abroad!

To the mature and experienced, to those on whom the weight of years is beginning to make itself felt, to those who have verified to the full the fact that glitter does not always mean gold, what vistas of chill discomfort and disillusion may open out before the eye of the mind at the thought!

'To the South of France!' cries the gushing friend. 'To the delicious Riviera; to the adorable Côte d'Azur! Such sunshine! Such a climate! You are indeed to be envied,' and so on. And, to cut the story short, you go.

You go to face the yelling mistral, the clouds of dust, the blazing, glaring sun that scorches your eyes and face, while the wind ices your back for five days out of seven, roughly speaking; and you fail to realise the charm of place or climate, or to see wherein you are to be envied. You smile on the wrong side of your mouth at it all, and over the bills of the palatial hotel which condescends to house you. You do not feel well perhaps, or you feel old, and you pine for comfort and privacy, of which there is none.

The distastefulness, the publicity, of the meals in the crowded restaurants, the indifferent waiting, the lengthy menu containing but little to eat that you fancy, the ogreish dishes of rubicund meats prepared to suit the supposed taste of the sons of 'perfidious Albion' or the flesh-devouring Teuton, the sameness of the mawkish puddings disguised under high-sounding names, the dab of wet ice as a treat on Sundays—you know it all of old, so well, so well! Then the evenings passed in the *salon* may not smile on every one; the mixed crowd, the bridge-parties aglare at the non-bridge players, and so on.

For the rich and extravagant there is, of course, the private sitting-room, to be had for a consideration not to be called modest by any means. It has velvet furniture usually, and a sofa so constructed as to accommodate no normal human frame, and an arm-chair also of that type; but there are many mirrors which may console you, and what faces of disgust and fatigue they must have reflected, you think as you look at your own long, peaky face! There is, however, a fireplace with an iron screen that conceals its

emptiness and that rattles hideously in the draught from the chimney. You may have a wood-fire if you like, also for a consideration; and you may huddle and sit over it, and listen to the slamming of doors and of outside shutters as the mistral shrieks with fiendish joy.

There are yet, however, a few of the older and smaller hotels extant for those who do not like the caravansaries—smaller but full of modest comfort, and making modest demands on your purse; but they are few and far between as are the lands of the 'Jumbies' as sung by the immortal Lear, and they are being rapidly improved off the face of the earth, to reappear in gaudy advertisement-sheets as 'full of all modern comfort, up-to-date, and under entirely new management.'

One such delectable little hostel I recall, with high red roof embosomed in a mass of mimosa bloom and sober olive. From its door you might step at once with book or sketching materials into quiet corners full of beauty without running the gauntlet of mopping and mowing German waiters, smiling and bowing *concierges* in gold lace and cap, and a crowd of hostile-looking hotel guests wondering who on earth you were and where you came from. To the friendly proprietor and his sharp, bright-eyed wife you were an object of personal interest not by any means wholly connected with your hotel bill. They honestly liked you, and admired your sketches, and were sorry when the day of your departure arrived. The days, however, of this restful little abode are numbered. Clamour and unrest have stepped in as usual, and it is to be enlarged—but 'greatly enlarged,'—and filled with all modernities and 'comforts,' and you will know it no more. Perhaps it may even have a band to bray at you while you eat your dinner. 'Well, well!' as the West Highlander says. But is it well?

You do not like the mistral. You do not like being roasted and iced at the same moment, and being reminded in your person of the ice once fashionable at smart dinner-parties, which was served with a boiling-hot sauce to pour over it, and called a something-surprise. Why not harden your heart and adventure into Italy? Go home by the Italian lakes, for instance, if not too early. They have, however, been known to be arctic in April, and well into April, with Motterone and his brethren on fair Maggiore looking like Christmas-cakes with snow to the water's edge. Possibly, however, this may be an exceptional state of things.

Perhaps, too, you may not like the Teuton who there abounds, having of late years taken to descending in his thousands in spring-time on this fair land, of which he is also absorbing some of the trade, we are told. The Teuton is doubtless often ungracious and lordly; but there are exceptions, and a pleasing recollection comes to the mind of the writer of a journey from Genoa to beautiful Maggiore; of a terrible scramble

at the Genoa station for seats in an ordinary corridor train, an odious class of English and American tourists pushing and crushing in the corridor, and garlic-scented *facchinos* thrusting through you and trying to clamber over you; and of eventually being hurled into a compartment occupied by four of the dreaded race, to the unspeakable dismay of the travellers—a dismay which proved to be quite without foundation, for their courtesy, kindness, and good-breeding will never be forgotten. They hailed, however, from southern Germany, and were as good to look at as to speak to. May all pleasant things attend them!

Travelling by the ordinary train is an abomination in Italy, unless you can speak the language and assert yourself. No one will tell you anything or from which platform the train starts, and the crowd and confusion is terrible.

Of course in the restaurant-car train, with booked seats and all cut and dried, it is plain sailing enough; but you may not wish, or be able, to travel there. Learn the language, therefore, young people, or you who wish to travel in Italy and to get to know the inhabitants and the ropes. Take a leaf out of the book of the dreaded Teuton, who is so thorough in all that he does. He speaks Italian, and he can return your slighting remarks about him, if you are so ill-bred as to adventure on such in his hearing, in your own language. He could doubtless equally enter upon an *entente cordiale* or otherwise with a Frenchman.

To return, however, to journeyings. A journey from the French Riviera to Genoa is one of pure delight as to the outlook, it is so lovely in spring-time, say April. The masses of flowers, the great banks of mesembryanthemum with thickest blossoms, rose-coloured and gold, clothing the railway-cuttings in places almost down to the rails; the palms, the beautiful flowering shrubs, strange and nameless to the writer; the turquoise and emerald and jade-coloured waters of the Mediterranean breaking in creamy surf close to the line; the startling blackness of the tunnels, which only serve to intensify the colour and brilliancy into which you emerge, blinking and owl-like, beggar description. Then, when Ventimiglia is behind you, and the train thunders on into Italy, a change comes over the spirit of your dream, and a still beauti-

ful but grimmer note is struck. You are back in the past. The power of the Church of Rome comes over you as the splendid old churches, the age-old ecclesiastical buildings, pass before your wondering eyes, venerable, time-stained, impressive, indescribably stately and suggestive. Albenga, with her rose-red towers, her history and traditions, is a dream of beauty backed by snow-crowned mountains, and you fain would tarry; but then you do not know where you would most wish to tarry; your eyes at length grow tired; you are sated with beauty. Evening advances; the carriage is warm; drowsiness besets you; you sleep.

You sleep until Genoa wakes you with its noise, its clamour, its trams, and its icy wind that rushes to meet you through open windows and doors of the railway-carriage.

Next day, when you are once more settled in your places in the train, and are beginning to recover from the hideous agitation of securing sitting-room therein, and from the reminiscences of the hotel bill, fresh and varied beauties unfold before you. The fat plains of Lombardy are unrolling themselves for you. The exquisite greens are in their pristine beauty; the rice-fields are flooded, and reflect a still and pearl-gray sky such as Corot loved to paint; slim poplars bereft of foliage and boughs nod quaint, plume-like heads, and are reflected in the quiet waters; peasants are labouring in the red-brown fields, splashes of red and blue and white garments looking like beds of huge anemone flowers in the distance; and splendid oxen, cream-coloured, red-and-brown, move about their avocations with stately step and slow.

Small and clustering towns are wonderful in colour and picturesque effect, and the old churches rise in towering grandeur above them, cutting the quiet sky, massive, important, frowning, and strangely frequent. Have they delivered their message, and how? Have they driven it home? It is not for us to say.

On and on thunders the train. A faint haze of mountains cuts the evening sky, and a silver thread cuts the middle distance. What is it but Maggiore? Beautiful Lago Maggiore, we greet thee once again; but Monte Motterone is shrouded in mist, an unfriendly and chill little wind is blowing, and all is gray and dim, reposeful perhaps after the mistral.

AMULETS.

By ALGERNON WARREN.

AMONGST the superstitions which have not died out in the United Kingdom, that of bearing a charm on the person for good-luck is still widely prevalent. The mascot or talisman takes various forms. The burglar, for example, will frequently carry a piece of coal about with

him, the card-player will wear a 'lucky-pig' or miniature horse-shoe, and so on. But in the East, and also to a large extent in southern Europe, the charm is employed with the idea of warding off calamities which are thought likely to affect not only the unprotected individual, but also his

or her belongings. To avert misfortune rather than to bring good-luck is, therefore, the common object in using the amulet in these localities. Any one, for example, who has had the privilege of access to the collection of several hundred amulets belonging to Professor Bellucci of Perugia can scarcely fail to be impressed with this fact. Fear, not hope, underlies the Southerner's trust in the amulet.

Great reliance is set on sharp-pointed stones resembling the arrow-heads of the Stone Age, termed thunder-stones, which, having been found in the soil in the immediate vicinity of objects struck by lightning—buildings, trees, animals, human beings, &c.—are credited with the virtue of protecting similar inanimate and animate objects from later flashes of lightning. To such an extreme does the credulity of the Italian peasant go that it is very commonly believed that the preservation of one of these thunder-stones in a house will not only safeguard the building, as well as the persons, animals, and crops pertaining to it, but will likewise afford protection to seven houses in the vicinity. Consequently these stones are handed down as heirlooms from one generation to another.

The thunder-stone is frequently to be met with at the head of a bed amongst the images of the saints to whom the occupant pays devotions; it is occasionally discovered in the wall of a building, generally at the base of the foundation; and these stones have also been found amongst human bones in the foundations of walls in Italy. Sometimes the stones are set in silver casings, and rings are often attached to them. One so set, having been picked up near a blasted oak, was firmly believed by the original possessors to have been a fragment of the lightning that struck the tree. In times of tempest the owners of such stones will light candles in front of the places where the charms are deposited, and pray for protection from the lightning-flashes, making each stone an object of great devotion. A cook in a country house, whose fear of lightning was no doubt accelerated by the metallic utensils with which she was surrounded, used to keep a thunder-stone, now in the Bellucci collection, on her kitchen-table.

Faith in these stones extends beyond the preservation of life and property; they are credited with healing powers, especially in cases of infantile ailments. Collectors have discovered them sewn up in leather bags, to be hung round sick children's necks by a ribbon; and even adult Southerners have been known to wear the stones in the hope of being thereby cured of some ailment.

Much trust is put in jade; and the religiously inclined, as also superstitious, Italian is wont to maintain tradition, and yet obey priestly mandates, by the adoption of that stone. Repeatedly the Church of Rome has formally prohibited the use of amulets or talismans, and

enjoined her followers neither to use them nor put faith in their virtue. The Italian confider in amulets accordingly solves the difficulty by wearing a cross of jade, whereby he cannot be accused of disobeying the clerical injunction, and at the same time he has the restful feeling that he has an efficacious amulet on his person. Small, heart-shaped amulets made of jade were formerly hung round children's necks in the belief that the jade would keep them from becoming frightened. These were called 'stones against fear.'

Although such superstition may seem ridiculous to the less apprehensive present-day Briton, it is not more so than the ignorance which existed in his own country in the eighteenth century, if we are to credit Addison's statement that in his time a mountebank had set up a stall and sold pills that were 'very good against the earthquake.' Even in modern times the English rustic sometimes carries a potato to ward off rheumatism.

Another form of amulet in Italy is the blood-stone, otherwise red agate. These stones are supposed to possess the virtue of stanching the flow of blood from any part of the body, and likewise a healing virtue in checking it by application of the stone.

Amber tablets are supposed by the Southerner to be specially efficacious against witchcraft, curses, and incantations; while to the use of sapphire drinking-cups is credited the power of alleviating headaches, and also of keeping the possessor in good humour and a contented state of mind.

'A day to be marked with a white stone' is a common enough British term for the indication of a fortunate event. Amulets of white chalcidony are termed milk-stones in Italy, and are supposed to strengthen nutritive powers. Nurses' bodies have been found with globular-shaped milk-stones hung over the breast.

Star-stone is the decidedly pretty name given to fossil madrepora, which in the form of a heart is a favourite amulet as a preventive of the 'evil eye' and bewitchment, and for keeping children free of intestinal worms.

Any one who has been in Italy and understands the language of a disappointed beggar there should readily believe that much weight is attached to the likelihood of the effect of the curse. Especially dreaded is a suspected witch's curse. Amulets termed 'stones against witches' are consequently in considerable vogue. They are of various kinds, some being naturally pierced stones, others portions of hone-stone and iron-stone. These are frequently attached to animals. One now in the Bellucci collection was taken off the neck of a sheep, and was supposed to have protected the entire flock to which the animal belonged. Then there are birth-stones which are believed to exercise protection over both women and female domestic animals. Many of these are pieces of argillaceous limestone.

In some parts of Italy considerable faith is

placed in a piece of lead as an effective amulet for the preservation of flocks of sheep and herds of swine. When any of these animals have purulent affections, leaden amulets are often attached to their necks to aid recovery.

In cases of violent nose-bleeding, the wearing of a fragment of hæmatite as an amulet is commonly considered an efficacious remedy.

A widespread form of amulet in southern Europe consists of coral in various shapes, comprising horns, a closed fist with the thumb placed between the first and the middle finger, a hand with only the forefinger extended, and other forms too numerous to mention. Great is the belief in the efficacy of a coral amulet, the virtues attributed to coral being manifold; but it is adopted more frequently as a protection against the dreaded *jettatura*, or 'evil eye,' so apprehended at the present day not only by the illiterate but by numbers of educated Southerners. As for the Neapolitans, the fear of the 'evil eye' appears to amount to a form of insanity, so fostered has it been by tradition. It must be remembered that a large amount of capital is embarked in coral-dredging, and there are not wanting those who have 'an axe to grind' in fostering this credulity with a view to maintaining a sale for a once excessively and still comparatively lucrative commodity. It is with the proceeds of the coral-dredging that time after time the inhabitants of Torre del Greco have been able, after the devastations caused by an eruption of Mount Vesuvius, to rebuild their dwellings more sumptuously than before. Pietro Colletta has recorded in his *Storia del Reame di Napoli* how, towards the end of the eighteenth century, six hundred large barques used to set out yearly for the coral-fisheries off the coasts of Africa. These vessels, manned by more than four thousand sailors, left in April, and returned before the beginning of winter. The industry, however, waned when it came under State control, and has subsequently suffered materially from Japanese competition, which has lowered the market value of coral. But to this day the belief in its powers of averting the baneful influence of the 'evil eye' is so strong in the Neapolitan provinces that it is unusual to find an inhabitant who does not wear a coral amulet. When the writer was in the island of Capri, not many years ago, on the terrace of an hotel which is always besieged in the season by smiling women with their baskets of coral pins, necklets, bracelets, brooches, &c., he noticed one of these sellers appealing most emphatically to a couple of English visitors, who had a pretty child with them whose golden hair and general appearance elicited a good deal of outspoken admiration. The two English visitors had made some purchases from her, but she persisted in pressing them to buy a coral necklace for the child. Seeing that they were indifferent to her solicitations, she forthwith took out of her basket a coral necklace with a coral charm in the

shape of a finger attached to it. This she presented to the child, even putting it round the child's neck herself. Subsequently the woman confided her motive, which showed her belief in the prevalent Eastern superstition that it is unlucky to be praised with particular warmth, and said that as the child's beauty was attracting much notice, some one might come and cast the 'evil eye' upon her unless she had a coral charm on her person to avert its influence. A waiter who was standing by nodded approvingly, and lifted the flap of his coat-front to show that he had a coral charm fastened underneath it. Early Italian writers have written much in support of the efficacy of the coral amulet; some have cited it as a charm able to overcome illusions and fears caused by the devil; others declared its ability to cause tempests and thunder and lightning to cease, and to make plants grow. Painters of the Holy Family have frequently depicted the Babe in the manger as wearing coral.

Many crystals, both clear and tinted, are employed as protective amulets against the 'evil eye'; and malachite amulets of heart-shape which are similarly accredited with virtue are often seen.

The teeth of various animals are utilised as amulets, and their possession by children is supposed not only to avert the 'evil eye,' but to assist dentition. Necessary limitation of space will not permit further description; but now that Italy is developing commercially with such rapidity, it will be curious to note in a few years' time whether industrial progress has deadened belief in the amulet.

FROM A WINDOW IN ZANZIBAR.

SUNSET.

THE sea is still; an Indian dhow
Crosses the sunset's gold;
Breathless the night, the palm-trees bow
Above the buildings old.

Along the twisting, narrow street
Slim native figures pass—
Veiled women, men with silent feet—
As wind-blown leaves on grass.

Down in the garden far below
The shadows creep like snakes,
The mottled croton-bushes grow,
The sleeping moonflower wakes;

Her flowers are fragile, silken things,
Scented and milky-white.
Listen! as for the death of kings
A drum throbs through the night.

The stars are points of silver fire,
The tufted palms are black;
The dhow, a ghost of sea-desire,
Follows the sun's last track.

And nigh above all things that jar,
Life's frets and fevers cease.
I watch night steal o'er Zanzibar,
I breathe the Eastern peace.

NITA H. PADWICK.

Chambers's Journal

SEVENTH SERIES

SOME PATIENTS AND THEIR WAYS.

By EDITH WHITESIDE

IT will be generally conceded that, as a class, doctors have better opportunities of studying their fellow-creatures—seeing them as they actually are—than any other body of men. In this respect the clergy run the medical profession very closely, associated as they are with their parishioners in their moments of overwhelming grief and their hours of deepest joy. But owing to the very nature of his occupation, the doctor has the advantage of seeing more of the inner life of people in general, because he is so frequently called in to emergency cases when there is no time to polish up the surface of things, to clear away the habitual litter, to put on fresh linen, to give the bedroom and house generally a superficially spick-and-span appearance. An apparent tidiness of the makeshift order is often quickly attempted to hide the bareness of the domestic surroundings; but the doctor's practised eye rapidly detects the veneer, his training in the habit of observation stands him in good stead, whereas the average layman would not note anything unusual.

What battles the doctor has to engage in with the huge army of householders who are firmly convinced that fresh air is very bad for the patient; for, poor thing, a draught will half-kill him! Even more fatal is clean water combined with soap, for the dear, delicate victim will inevitably catch cold after the much-needed bath. Oddly enough, it is quite as common to find people in the most beautiful and healthy country districts as much opposed to sweetness and light, fresh air and cleanliness, as are their less favoured town cousins in the crowded slums.

In Cumberland and Westmorland, as well as over the Border, there are some quaint proverbial sayings which cast an unsavoury light on the notions of some of the inhabitants. 'The clartier the cozier' is an adage which in itself is cause for suspicion. What an appropriate motto it would have been for Mrs MacClarty of the *Cottagers of Glenburnie* fame!

If you'd live for ever,
Wash your feet seldom,
And your head never,

is a curious rhyme, a belief in which may afford a key to the superstitious repugnance which many people apparently have to soap and water.

A patient in a Westmorland village was found

No. 107.—Vol. III.

to be in such an offensive condition that the doctor ordered a hot bath right away. 'Nay, nay,' was the old man's rejoinder. 'I've never had a bath since I was a baby, and I isn't going to start now.' Another of the same class who had sprained his ankle was told that he must have his feet washed. 'Wash my feet!' he cried. 'Not me. I'd as soon think of washing my head.'

One day a young mother brought her child, a pretty little girl, to her doctor in the Midlands. 'I can't tell w'at ails 'er, doctor. She's goin' for six, an' she only looks about four; she 'as no appetite, an' she whines all day. I'd like you to examine 'er an' see w'at's wrong.' The doctor quickly diagnosed the case. 'Take her home, heat plenty of water, and give her a good bath; and mind you use plenty of plantol soap. Then bring her here again. Now, be particular, and remember the name—plantol soap.' The everyday pale-yellow soap would have answered the purpose equally well on this occasion for the necessary cleansing of the unfortunate child; but it was no part of the doctor's scheme to let the woman see that the virtue of the simple treatment did not lie in the use of any particular variety of purifying medium, or she might not have followed the advice closely enough for efficacious results.

It might reasonably be thought that the slums of Edinburgh would furnish more uninviting cases of dirt, squalor, poverty, and neglect than could possibly be found in the country. Yet a doctor in the English Lake District solemnly asserts that he has found more nauseous and poverty-stricken surroundings in that highly favoured playground of England than in some of the dingiest and lowest haunts of Auld Reekie itself. In one case an unhappy woman was lying on an apology for a bed; beneath her was an old sack; there was no mattress, or any approach to one. More ragged, dirty, unsavoury bags of the same material—coarse brown canvas or sacking—were arranged as the sole covering to this wretchedly uncomfortable couch. Chairs, tables, &c. were non-existent. Moreover, the most elementary articles of domestic use and necessity were conspicuous by their absence. Not far away, in the same parish, was another glaring case. Here the husband was a hard-

[All Rights Reserved.]

DECEMBER 14, 1912.

working, capable little fellow who made what his class call 'good money;' but the helpmeet (!) was a complete failure. Gradually the stock of furniture got reduced to worse than sticks, for the children were put to sleep in old sugar-barrels, a packing-case inverted served for a table, and smaller rough boxes were used for seats; and the landlord's property was sadly misused, for any available wood in the cottage, such as cupboard-doors and stair-rails, vanished for firewood. The woman had one bucket, which was utilised equally for carrying out soap-suds, dish-water, &c., and for bringing in the clean drinking-water; in fact, it was the *omnium gatherum* bucket of this worse than pigsty of an establishment. In common with her more thrifty and civilised neighbours, Meg had the saving virtue of baking bread at home; but her method of keeping the dough warm was more effectual than sanitary or appetising. Having duly kneaded the dough, she carried it into her bedroom and placed the pan in the bed, which was unaired and untidy, just as she had got out of it earlier in the morning. She covered up the pan with such grimy blankets as she had in order to retain the heat as much as possible. If Tommy, her husband, who was sometimes on night duty, happened to be occupying the bed, so much the better—the dough would be kept warmer; only he was duly admonished to be careful, and not to knock the kneading-trough out on to the floor.

If Meg had clothing given to her, she used the garments just as they were, irrespective of size. So it was no unusual thing to see her with a train a foot long, collecting mud, refuse, microbes, anything; for she never troubled to lift her trailing robe. Under such hopeless conditions it was inevitable that the physical and moral state of Meg's household should be pernicious.

What the eye does not see cannot grieve the mind, or poor appetites would often ensue. For instance, a doctor in his rounds on the borders of the Lake District had a strange find, akin to blanket-surrounded dough. The family bread-pan was amissing, or more probably had never existed. Anyway, the week's batch of bread was snugly reposing on the bed, spread in repelling fashion on a once white blanket, in company with sundry trifles such as a man's 'dicky,' greasy cap, soiled collars, and other odds and ends of personal wear; in effect, the bedstead was couch, wardrobe, and larder combined, going a step farther than Goldsmith's neat cottage, where

The chest contriv'd a double debt to pay,

A bed by night, a chest of drawers by day.

If some patients have odd notions as regards cleanliness, others are equally at sea on the question of medical usage and etiquette. A doctor who had been attending an old farmer for a fortnight or so pronounced the patient so much improved that it would be unnecessary for

him to call again professionally. Next day the medico was not a little astonished to find the ex-patient in the surgery with a half-consumed bottle of medicine in his hand. 'I thought, doctor, as you said that I was all right again, that I needn't finish t' bottle, so I've brought it back, as it'll happen come in handy for some other badly [sick] body that's got t' same complaint as I had. And you'll likely knock something off my bill, seeing that I've only supped half of it;' thus showing a shrewd, saving turn on the convalescent's part. Then other patients are apparently under the impression that the medical profession is one huge joint-stock concern. Thus a doctor in a small Yorkshire town was not a little surprised to receive a visit from the wife of one of the opposition doctor's patients. 'What can I do for you?' 'Why, Dr Squills said we had to go to him for some lotion; but as it's such a long way from our street to his surgery, I thought it would be all as one if I came to you instead, seeing your place is handy like.'

Some sick folk—more particularly men—take themselves very seriously if they are ordered to bed and limited to milk diet. A practitioner, on his rounds one morning, came to the bedside of a woman who was lying in great pain, waiting patiently till her condition warranted a most critical operation. She greeted the doctor with a welcoming smile. 'Why,' said he, 'you are nothing less than a marvel for pluck and endurance; and your bravery is all the more striking because I have just come from a man who thinks he is going to die from a carbuncle. In fact, he is keeping the whole family running about, with long faces, trying to get him first this and then that old wife's remedy to ease the ulcer.'

Even the gravest crises in life often have their ludicrous side. The following incident is a case in point. In what turned out to be a rash moment, a young doctor in the north country warned the friends of a man who was lying in a very bad way that the end was probably very near; he suggested, too, that as he saw no hope, humanly speaking, the patient should be told that he was in a moribund condition, and that he would probably pass away before midnight. The sick man took the painful intelligence with characteristic north-country coolness; then, after hearing the clock strike twelve, he roused himself vigorously and called out, 'That doctor lad's all wrong. I isn't going to die yet; the time's gone by. But I is ter'ble hungry, so fetch me a good collop o' fried ham.'

Naturally the food question is one of the biggest troubles with which doctors and nurses have to deal; for relatives and patients alike too often think that they are scoring off the doctor if they can manage to give an invalid an appetising but indigestible and unsuitable tit-bit. Some people are apt to place too literal a construction upon the doctor's orders to the injury of the sick one. As an instance of mistaken

kindness, the following occurrence affords a striking example of ignorance or of wilful misconception. A physician happened to pay his visit when a sick woman was having her dinner, and he noticed that she was attacking the food with suspicious relish. 'Ah, I see you are enjoying your dinner, Mrs Smiggs.—What is she having?' he asked the daughter. 'Just some jugged hare, same as the rest of us.' Jugged hare, when the woman was suffering from an ulcerated stomach! 'What on earth'—and Dr A, usually a mild-tempered man, all but swore. 'Did I not order milk, and so on?' 'No, sir; you said she had to have spoon-food; and spoon-food she's had all along; though it's a bit awkward for the poor dear not being allowed her knife and fork regular.' In point of fact, this delicate-stomached creature was habitually feasting on 'what was going,' with the slight difference that she was manipulating the food with a spoon; and the practice might have gone on indefinitely or until the woman was past all curing had not the doctor happened to pay his call at an unusual hour.

A sense of humour is sometimes conspicuously absent in persons who consult a medical man. A woman who was evidently unable to see the ludicrous side of things said to her doctor when he was attending a member of her family, 'A horrible thing happened to me the other day, Dr B.' 'Ah!' 'Yes. I was eating some plasmon chocolate, and all at once I found something hard in it. And what do you think, sir? It was actually a tooth!' 'Shocking carelessness!' remarked the doctor. 'It reminds me of the Chicago tinned-meat horrors one heard of a few years ago.' 'Just what I thought myself, sir.' The doctor suggested that the woman's husband should write to the chocolate manufacturers and make a statement as to the undesirable substance found in their sweetmeats, for something was due to the firm as well as to the public. 'Yes, sir; and do you think that William should mention that it was one of my own teeth?'

'Your own tooth! Do you mean to say'—Words failed the medical attendant, and with a 'Good-morning, Mrs C.' he left the good lady to wonder what his sudden departure could mean.

Yet another story connected with teeth. The family doctor was called in early one morning to see a farmer's wife. 'Eh, doctor, I am pleased you've come, for I feel that bad I shall die before night if you can't cure me. You see, I've swallowed my false teeth. I had them in last night when I went to bed, and I woke up this morning with a terrific pain here'—indicating the place—'and I can feel them with my hand. There's the shape of them exactly sticking just there, and they'll neither go up nor down.' The doctor tried to reassure the dame. Surely she must have made a mistake. 'No, I haven't. Besides, where are they if they are not in my inside?' The practitioner suggested the most likely remedies, gave certain instructions as to diet, and said he would call in again before noon. He left the old lady rocking herself in fear and looking the picture of misery, and while he was on his rounds he gravely considered her case and the probable necessity of trying X-rays. Later on he came back to the farm, where the good lady was now bustling about, cheerfully engaged in household work. 'Well, Mrs Stubbles, you're feeling brisker evidently?' 'Eh, doctor, I'm as happy as a queen, for I've got my teeth back,' showing two pearly sets. 'How did you manage that?' 'Why, you see, sir, I had never swallowed them at all. Our Ralph had got up early to see to a horse that was ailing at a neighbour's, and he found my false teeth lying on the floor. He thought he wouldn't wake me, so he put them by safe in the corner cupboard. I remembered afterwards, when he came in and found me in such a miserable way, that my teeth had hurt a bit after I had got into bed; and I thought I had put them under the bolster; but I was that sleepy I must have put them too near the edge of the bed, and seemingly they'd dropped off on to the carpet.'

THE SHIP OF SHADOWS.

CHAPTER IV.—ARCADIAN AND PHILISTINE.

FIFTEEN years later. Near me the purring of the tide, the Glen Burn talking drowsily to herself, the wind hisping through the bracken, the hum of myriad insects. Above, mellowed by distance, the vibrant whirr of a reaper in a haze-set golden patch of corn; a faint tremolo from the distant specks of sheep on the hills; the hectoring *G'back-back-ack-ck-k-k-rrr* of a cock-grouse in the heather, rippling the melodious silence of a summer day. Fifteen years of wandering behind me, I heard the sounds, faithful and remembered, of my boyhood, and beheld again the friendly hills and howes of home.

My cousin Hugh, more fortunate from the material point of view or more deserving than I, now owned the old house. I was there on his hospitable invitation, and, comfortably tired after a long tramp under the August sun, we were resting in the shade of a silver screen of birches in the lap of the hill.

As a boy, my senior and near relative, Hugh had been my mentor and critic, a superior being, idealised by me through a haze of admiration and envy; and even in after-life, such is the influence of the plastic years, I sometimes took from him caustic comments

that I would have hotly resented from any other man.

Nevertheless, we were firm friends, with the friendship that is often welded by basic and polar differences. Each was the antithesis and complement of the other. Unfortunately, I had an income just sufficient to keep me from the blessing and spur of regular work, and had become a wanderer on the face of the earth. Hugh had won his spurs at the Scots Bar, owning one of the best junior practices there, and his profession and his instincts kept him at home. My bent was for literature, romance, the desire to create something, born of a temperament; his was towards, as I thought them then, the dismal and dictatorial twins, political economy and mathematics.

I was as a boy, and am still, a dreamer; but if in school-days I wove our youthful plots, the practical Hugh took the initiative, organised and carried them out. My outlook was sanguine to iridescence; his was in relentless black-and-white. I would go miles to see a sunrise; he was as matter-of-fact and unromantic as a washing-bill. Marcus Aurelius's 'Wipe out the imagination' might have been taken to his heart literally. His only dreams were of the Bench, and I doubt if he would have turned aside from a brief to look at the Victoria Falls of the Zambesi or the burning of Moscow.

There may never have been a great advocate, but there have been sound lawyers lacking in the divine gift of imagination; and if Hugh eschewed or was incapable of rhetoric, he was a monument of industry and accuracy. Figures were his delight, and—which is saying a good deal—the most chartered of accountants who ever transmogrified a balance-sheet did homage to his hard-headed qualities. His freckled, indeterminate boy's features had given place to a good rectangular face. One of his shrewd eyes scanned the world through a monocle; and though his cast of countenance, clean shaven and alert, recalled a modern American type, he was capable of a devastating 'who-the-devil-are-you?' British stare.

The day was perfect. We lounged in silence for a time, my senses revelling in the glowing cardinal colours of blue and gold interwoven on the mighty canvas of sky and sea and sand. Hugh pulled stolidly at his briar-root.

'I envy your having a *piéd-à-terre* near the shore in old Galloway, Hugh,' I said. 'To me there is a spell and a fascination in the long level of the sands.'

'Um!—um!' He weighed the pros and cons. 'Well, the telegraph-office is eleven miles off, and the *Scotsman* doesn't reach us until four o'clock. Still, the building fiend hasn't vulgarised the spot as yet. Yes! It has its good points. I suppose this isn't a bad corner of the world. You might have had one of your own, Frank, but you preferred stravaigin' over

half of God's earth, pigging with Digger Indians'—

'Not quite!'

'Well, something akin to it. Loafing in Japan!'

'Loafing indeed! Man alive! the colouring there! the radiance! the—the quintessence of poetry of the country! the—the most'—

'Don't enthuse. It's too warm. Besides, I've heard all that transcendental rubbish scores of times. I can reel lots of it off by heart: all about the blaze of the wistarias and the azaleas and the lotus-flowers, and the message of the dark cryptomerias, and the'—

I cut in, humming the lines half to myself:

'Thundering great camellia-trees,
Decked with blossoms gay,
Adorn the road to Nikko,
The mountain road to Nikko,
In the month of May.'

'There you are!' he cried. 'I never knew a rolling stone who wasn't able to hypnotise his reason with a jingling verse or two! Then, the Argentine! the Cape! Vancouver! You've lived in them all!'

'Yes, "*Ich habe gelebt und geliebt*" in them all,' I conceded.

'I guessed as much,' he grunted.

'Yes, Hugh, I have heard the songs at evening by lone camp-fires in the Rockies; I have watched the stars above the veldt; seen the Great Bear dip and the Southern Cross lift; held my breath when the dawn burst over the Golden Gate. And the South Sea Islands! I have stood by R. L. Stevenson's grave; I remember the tropic moonrise there, and the long, musical roll of the Pacific on the beach'—

He was not impressed.

'That's rococo! Strikes me you'll see more of "on the beach" yet,' he interrupted. 'What have you made out of it all?'

'Health, sport, romance, the *joie de vivre*, zest,' I replied truthfully.

He turned and gave me a long stare. Then slowly and with forbearance, as one might instruct a backward child, he said, 'I—meant—to—ask—if you had increased your capital at all.'

'That,' I replied loftily, 'is a bagman's estimate of life.' (I would get back 'some of my own,' I thought.) 'My dear chap, you have the huckster sense. Art, a—a creation, can't be labelled in bawbees.'

'If the "creation" happens to be a new hat for your wife, unfortunately it can't—in bawbees,' he said feelingly.

'You are flippant. The—the Greek spirit, originality, work done for the love of it, the reward of such cannot be computed in little gold discs stamped with His Majesty's likeness!'

'Your reward can't, you mean. Come, old man, confess! It wouldn't lower their artistic value if you could sell your productions, would it?'

I was silent. I had published a volume of verses, an *édition de luxe*, printed on superb paper (at my own expense, for private circulation); but editors and theatrical managers were as fugitive as the other efforts I sent them. These returned to me with the singular, or rather the plural, and disconcerting regularity of a boomerang.

'Fact is,' he continued, 'you dream dreams and see visions and weave romantic mists round the obvious. You've been cursed'——

'Or blessed.'

'With a competence and a temperament. The Romantic Movement may have done much for Europe, but it hasn't done much for you. Man, I get cargoes of romance out of my work at the Bar.'

Thrice happy, he held one of the great secrets of life. He raised his voice. 'Harness your imagination, Frank.' His eyeglass impaled me. 'Harness your imagination! You're too near the Edge of the Cliff of the Useless Wonder-Seekers.' He spoke still louder, and brandished his pipe at me. 'Ach Gott! drive some Chariot of Work, thou poor Wanderer, however it may creak and lumber. Be a living Working-Man!'

He nettled me. 'I don't deal in imitation chunks of Craigenputtock,' I rejoined. 'Give me the real stuff—this, for instance, "The understanding is indeed thy window, . . . but phantasy is thy eye."'

He was silent, and I thought that the *riposte* had silenced him. So it had. But there exists in Scotland a nauseous habit, indigenous as Highland Malt, Athole Brose, or the Personal Devil. It consists in producing a half-nasal, rude sound, neither grunt, sneer, nor ejaculation. Something of each. Perhaps the reason

of its existence is the national instinct of economy applied to human speech. It is all-pervading. It flourishes in the Parliament House as well as in the Cowgate. The travelled Scot returning slips into the habit again—if he ever loses it—as easily as into his mackintosh. The sound is very imperfectly indicated by the spelling, 'Imphm!' Accompanied by a portentous headshake, it is the stock-in-trade of many a blockhead, the dullard's delight, the secret of his reputation for shrewdness. He may not understand what you are talking about, but he owns in it a grand non-committal stop-gap. Its *nuances* may convey surprise, interest, indifference, derision, satisfaction, dissatisfaction, defiance, fear, 'yes,' 'no,' 'perhaps,' anything or nothing—a mean, wriggling worm of speech without the character or the directness of a curse. Compared with it, even 'Hoot awa, mon!' another northern flower of diction, is as an orchid to a thistle. It has always had a peculiarly maddening effect on me, and Hugh knew this.

He turned the full searchlight of his eyeglass on to me, and said, 'Imphm! Imphm!'

I rose, outwardly calm. 'Man, you haven't got a soul above the Christmas Number of the *Juridical Review*, if there is such a thing. I think I'll stroll home by the sand,' I said, with too obvious a yawn. 'See you at dinner.'

Then I took the cliff path through the bracken. Five minutes in the bright sun routed my irritation, for blithe, exultant birds were singing, bees boomed in busy content to and from the heather, and every blue peak of the Galloway hills, every turn of the track, was a landmark of old days.

(To be continued.)

THE PANAMÁ RAILWAY.

By W. B. LORD.

DURING recent years a strip of land curving about four hundred and seventy miles, so that it closely resembles a bent finger, has occupied a large amount of public attention. Since the days of Grecian glory no such small patch of land as the Isthmus of Panamá has gained equal distinction. It has been the scene of stirring adventure and the site of the wealthiest city in the world. It has been the subject of epoch-making diplomacy and a sphere of political disturbance. It is the seat of the greatest engineering enterprise in history—an enterprise which is destined to—— But that is another story.

As the construction of the Panamá Canal progressed it became necessary from time to time to abandon small sections of the original Panamá Railway line, which was constructed in 1850-55 by three Americans—Aspinwall, Stephens, and

Chauncey. In 1908 the section between Mindi and Tiger Hill was lifted and placed elsewhere, as the old line passed right through the site of Gatún dam and locks. In 1910 the section between Pedro Miguel and Corozal was shifted, establishing a line permanently at an elevation sufficiently high to be above the level of the Miraflores Lake; and on 15th February 1912 the new line between Gatún and Matachin was put into service, as the rising water of the Gatún Lake, due to the closing up of the Chagres River at Gatún, would soon have flooded the old line between these points.

Finally, with the completion of the Panamá Canal, a new railway will have been constructed, running from Colón to Panamá, entirely on the east side of the waterway, instead of continually crossing the track as it did previously. During the whole of the changes traffic across the isthmus was not suspended at all, although pas-

sengers for some considerable time travelled in a roundabout way between the two cities at each side of the republic. Engines had to be changed at one point and the train taken back almost whence it had come, so as to enable it to negotiate the newly made line which extended in a different direction. Here another locomotive attached itself at the head of the train, and it proceeded to the end of the journey.

The new line of the Panamá Railway is 47.1 miles long, or slightly shorter than the old one. From Colón to Mindi, 4.17 miles, and from Corozal to Panamá, 2.83 miles, the old line is used, but the remaining forty miles are new. From Mindi to Gatún the railway runs in general parallel to the canal, and ascends from a few feet above the tide-water elevation to nearly ninety-five feet above that level. At Gatún the line leaves the vicinity of the canal, and runs east along the valley of the Gatún River to a point about four and a half miles from the centre line of the canal, where it turns southward again and skirts the east shore of Gatún Lake to the beginning of the Culebra Cut at Bas Obispo. In this section there are several huge 'fills' of rock and earth, occurring where the line crosses the Gatún Valley and near the north end of Culebra Cut, where the line was taken round so as to furnish waste-dumps for the dirt excavated from the canal. Originally it was intended to carry the railway through the Culebra Cut on a forty-foot beam ten feet above the water-level, but the numerous landslides made this plan impracticable, and the line was taken around the cut, and is known locally as the Gold Hill Line.

Leaving the canal at Bas Obispo, the Gold Hill Line gradually works into the foothills, reaching a distance from the centre line of the canal of two miles opposite Culebra; thence it runs down the Pedro Miguel Valley to Paraiso, where it is only eight hundred feet from the centre line of the canal. This section of the road is laid down on a maximum grade of 1.25 per cent., and has a total length of nine and three-eighths miles. The sharpest curve on the whole line is seven degrees. From the south end of Culebra Cut at Paraiso, the railway runs practically parallel with the canal to Panamá, with a maximum grade of 0.45 per cent. Where the railway crossed the Gatún River, a bascule steel bridge has been erected; and a steel-girder bridge, a quarter of a mile long, with a two hundred-foot through-truss channel span, is in use across the Chagres River at Gamboa. Small streams are crossed on reinforced concrete culverts. Near Miraflores a tunnel seven hundred and thirty-six feet long has been built through a hill.

The relocated line was made absolutely necessary by the new plans of the Isthmian Canal Commission for building an eighty-five-foot level lock canal. Some serious landslides occurred on the new line during the process of construc-

tion, when several peculiar accidents happened to various kinds of heavy machinery and to the railway metals. The greater part of the time taken and expense was necessitated by the crossing of the Gatún Valley. From the point where the road leaves the Gatún ridge to the hills near Monte Lirio, a distance of three and a half miles, the line crosses the main valley of the Gatún River and its tributaries. In this section there have been placed five and a half million cubic yards of embankment. The foundation of a part of this embankment was very poor, causing its base to be spread over a much wider area in order to reduce the pressure per square foot on the natural ground, and prevent upheaval beyond the foot of the slope. The total cost of the new line is estimated at nine million dollars, American money. The first line cost seven million dollars, which was considered an enormous sum.

As late as sixty years ago the city of Panamá was more difficult to reach than is Tibet to-day. The only means of communication after the rule of Spain had ended and the paved road across the isthmus from Portobello, on the Atlantic, had become a ruin, was either by sea or by the Chagres River, in canoes or small vessels as far as either Gorgona or Cruces (Venta Cruz), and thence by mule-road through the densest of jungle to Panamá. The isthmus was a complete wilderness from shore to shore, when all at once it became a centre of attraction for interocean transit. The first concession for a railway across the isthmus was granted to a Frenchman in 1847, but he failed to raise the money necessary to build the line. In December 1848 a concession was granted by the Colombian Government to Aspinwall, Stephens, and Chauncey, and this was modified to the advantage of the company in April 1850. The *cessionnaires* had in view the handling of the immigrant trade bound for California and Oregon, then recently opened to settlement, and Aspinwall had already, in 1848, established a steamship service between San Francisco and Panamá. The discovery of gold in California made it possible to raise the money to begin the undertaking. The promoters took the first steps on general principles; they believed that a road across the isthmus would pay; but it did not enter their minds, or the mind of any other living mortal, that their scheme would prove the dazzling bonanza which it did.

As Mr Aspinwall had been prominent in everything relating to the success of the undertaking, it was proposed to name the Atlantic terminus after him. It had been called Navy Bay or The Bay. The suggestion was adopted with enthusiasm, and it was supposed that the name would be permanently established. But the Colombian Government decided that the place should be called Colón, arguing, no doubt, that Christopher Columbus was a much greater

man than William H. Aspinwall. The former had visited the bay in November 1502, and had named it Bahía de los Navíos; and although Aspinwall was used very generally the world over, especially by Americans, for a good many years, Colón became the legal name.

Even when the commission of an American consul for Aspinwall was made out at the state department in Washington, the Bogotá Government refused an exequatur on the ground that there was no such place in the country. It was perhaps an ungracious act on the part of a friendly state; and it is probable that Secretary Fisher so regarded it, since he would not have a new commission made out for the consul, preferring to send the official out as a commercial agent, for whom an exequatur would not be required. But of course all subsequent commissions were made for Colón, as the right of Colombia to label all towns within her territory had to be conceded.

For a time Colón-Aspinwall and Colón (Aspinwall) were written and printed; and a funny thing happened, if a wreck can be called humorous. A captain strange to the port came sailing in one day before the strong trade-winds, and, to the surprise of all who saw him, held his course straight away past the lighthouse and the wharves, under full sail. People looked and wondered, and said beneath their breath, 'Tis our belief that you will soon be piled up on the reef!' And, sure enough, he was! The vessel became a total wreck, and the cargo was lost. The captain and crew were saved with great difficulty. It was thought that the skipper must be insane; but after he had been questioned, the cause of his strange conduct was made plain. On his chart was marked 'Colón-Aspinwall'; and was not Aspinwall after Colón? 'Vat ish der madder?' he said; and he could not be convinced of his error. He had found Colón all right, and was simply steering for the other place when he struck! He was an honest old chap; the disaster was put down as a peril of the sea, and his insurance paid.

Later the Colombian postal authorities gave notice that all correspondence addressed to Aspinwall would not be delivered, but would be sent back to the places whence it came. Thus, finally, the present name was adopted; although for a long time, in the United States especially, the old name was better known. Curiously enough both Columbus and Aspinwall will shortly be honoured in another way in Colón. The statue of the former, a beautiful production in bronze, is shortly to be set up in the garden in front of the new Washington Hotel, now in course of construction on Colón Beach, and a bust of Aspinwall is to be placed in the grounds at the back of the hotel. The latter is just as ugly as the former is beautiful, and since they were landed on the isthmus both monuments have passed through many vicissitudes, which almost eclipse the adventurous

lives of the notable men they represent. Like the Tivoli Hotel at Ancon, the Washington Hotel is being erected on behalf of the United States Government, and will cater for tourists as well as accommodate official visitors to the canal zone.

At the time of the building of the original line railways were in their infancy, and the project of a line fifty miles long across a notoriously unhealthy country was regarded as a distinct hazard. Money was scarce in 1851, and the progress of the work was not encouraging, as the line had been completed only to Gatún, seven miles inland. In November of that year a ship unable to land its passengers at the mouth of the Chagres River, as sometimes happened, landed them at Colón, and at once the railway came into use. The rates charged were exceedingly high, but the service was prompt compared with the canoes on the river. From 1852 to the present time the line has paid a dividend of from 3 to 61 per cent. annually.

Clearing was begun in May 1850, and the first train crossed the isthmus on 28th January 1855. As originally constructed, the line was forty-seven miles three thousand and twenty feet long, and the summit was two hundred and sixty-three feet above sea-level. From the beginning the traffic in passengers and goods was heavy, as the route was used by people all over the west coast of North and South America. Until an arbitrary decision of the management drove them from the trade, there was a line of steamers which carried European freight from Panamá to Wellington, N.Z., and Sydney, N.S.W., and up to that period—1868—no regular steamship route lay through the Strait of Magellan to the west coast of South America. In 1869 the railway across the United States was completed, and thus a considerable amount of the goods traffic and almost all the passenger traffic for California and Oregon were diverted. Notwithstanding these losses in traffic, the line continued to pay good dividends.

In August 1881 the French Canal Company purchased sixty-eight thousand eight hundred and eighty-seven of the seventy thousand shares of the railway stock at two hundred and ninety-one dollars per share. The railway was absolutely necessary for the construction of the canal. When the United States completed its purchase of the French rights on 4th May 1904, it came into possession of the sixty-eight thousand eight hundred and eighty-seven shares of the railway stock, and by private purchase acquired the balance.

The heavy equipment purchased for the canal work made it necessary to relay the road—a double track forty miles long—with eighty-pound rails, and otherwise improve the property. Since 1904 the equipment has been renewed, and there are now one-hundred-ton oil-burning locomotives, large and comfortable day-parlour, and hospital carriages, as well as forty-

ton freight-cars. Hospital-carriages are novelties on railways. They are fitted with comfortable bunks, loose beds, and easy-chairs, to accommodate men who are injured or fall ill while engaged at any part of the canal works. Thence they are taken by train, ordinary or special as the case may be, to Colón or Ancon, where well-equipped hospitals are maintained by the United States Government.

The commercial usefulness of the Panamá

Railway has been somewhat handicapped by the canal work, because all considerations are made secondary to this. At present it cannot handle all the freight between the east and west coasts of the United States that could be procured, but it does carry an average of thirty-five thousand tons of commercial freight a month. This is about half of the total freight carried, the balance being for the construction of the canal and for railway purposes.

A CASE OF NERVES.

CHAPTER II.

ON Friday morning Louie and her father were seated at breakfast in their private sitting-room.

'Slept all right?' he asked.

'Not a wink, dad.'

His brow clouded, and she laughed out.

'Nothing unusual,' she said lightly. 'Sleep is such waste of time! And last night—after the play, and the racket of the traffic, and the big-city feeling, and the knowledge that thousands and thousands are awake and working—it seemed a crime merely to sleep.'

With a new insight, the squire read that strange, tired look in his daughter's eyes, and somehow she altogether failed to blind him by the studied vivacity of her expression.

They turned from the table. The squire took out his pipe, and Louie began to fidget vaguely with the *Morning Post*. She had not yet written that letter to Charlie. Perhaps—

'Louie, I want you to do something for me.' Her father interrupted her thought abruptly.

She dropped the paper, and realised her father's nervousness. 'I will do anything, so long as you don't stare at me like that, dad,' and she rose and came and sat on the arm of his chair. 'Unless,' she added, 'it is something foolish about Charlie.'

'It is nothing about Charlie.'

'Then quick, dad!'

'I want you to go with me this morning to see Sir Wallace Dearman. He is an old friend of mine, and a great doctor. I think perhaps he might put you on your sleep again. Girls of twenty-two have no business to give up the idea of sleeping. For an old man like me it is altogether different.'

'Dad! I never heard such nonsense. As if it hurt me not to sleep! I am not ill.'

'No,' he agreed, 'you don't seem to be ill—that is the puzzle; but as we are in London you will go—won't you, little girl?'

'You came up for this one thing?' she demanded, turning on him.

He reddened like a boy. 'I can't lie to you,' he acknowledged ruefully. 'I wish I could!'

For reply, the girl leaned over and kissed his

puckered brow. Then she stood up energetically. 'Dad, this is really a most preposterous idea. Why should you waste precious guineas on a doctor? Far better let us go out and choose a hat—except that the choosing would bore you so frightfully, and you are too good to bore!'

'I would rather bring sleep to your eyes, little girl, than see any Parisian foolery on your head.'

'I agree,' she nodded. 'I give up the hat. But I do want a new riding-habit; and if you'd care to treat me to an up-to-date saddle'—

'If you will let me take a taxi to Harley Street I promise you Long Acre and the habit-maker,' he answered.

'It is absolutely ridiculous, of course,' she said. 'Have you made an appointment? Are you and this precious doctor in league already?'

'Certainly not,' he retorted. 'I swear you shall tell your own story, if you'll let me go to the telephone.'

'You are a poor schemer, dad!' laughed the daughter. Yet she let him go. If the truth be told, she was growing rather scared at certain feelings she had been suffering from lately, and at least it might be just as well to get rid of her sleeplessness before September. The pageant might go better if she felt more fit. Besides, her ambitions began to aspire towards an embroidered saddlecloth when she rode forth as Joan of Arc, and present obedience would spell untold indulgence from her father later.

CHAPTER III.

LOUIE was sitting with her face towards the light, being interviewed by the doctor. She was relieving her feelings by protesting that there was nothing whatever the matter with her, while the doctor now and again made jottings in a book. Louie was jeering inwardly, and wondering when the farce would end.

At last the great man looked across at the squire. 'Suppose I see the young lady for a few minutes alone!'

The squire leaped to his feet. 'Certainly—oh, certainly!' he exclaimed nervously; and he

departed to face the tortures of a doctor's waiting-room.

A sudden lonely fear gripped Louie as she saw him go, and, to her annoyance, her eyes filled with uncontrollable tears.

The squire was indeed alarmed at his own stupendous success. He had scarcely dreamed that he could get Louie beguiled into a nerve specialist's den, and as he deserted her he felt like some diabolical conspirator.

Sir Wallace Dearman was a prince in his profession, and his strength lay in his power to enforce his will on his nerveless patients.

The squire felt, as he gazed vaguely at a horrible picture of Samson and Delilah, as though he must rush back and clutch his child from the doctor's iron grasp. He trusted that Sir Wallace would not be too hard on his poor little girl.

His 'poor little girl' had hastily wiped away the betraying tears, and as the doctor returned to his seat she forced herself to meet his glance bravely enough.

'I wished to see you alone, Miss Holland, because, if we are to effect a cure, patient and doctor must work together.'

Patient! How the word startled her.

'But—I am not ill; there is really nothing wrong with me—except that I cannot sleep. Heaps of people can't sleep,' protested Louie, and an obstinate tone which her father knew well came into her voice.

'And,' went on the doctor, quite ignoring her remark, 'I never take patients who are not willing to carry out my wishes—both in the spirit and in the letter.'

'My father is such a fidget!' Louie exclaimed. 'It is so stupid of us to have wasted your time like this, Sir Wallace.'

'I think you said you were two-and-twenty?' pursued the doctor.

'Yes.'

'And you lead a fairly busy life?'

'I hate idling.'

'Exactly. Well, now—to help me—suppose you run through a typical day's engagements. What happened on Wednesday, for instance? Be quite frank, please.'

The tone was commanding, and somehow Louie found herself cataloguing her day, finishing up with the dinner-party.

'And bridge, I suppose, until, say, midnight?'

'Perhaps,' said Louie reluctantly.

'And after that you lay wide awake until'—

'It might have been five o'clock,' confessed the girl.

'And now tell me the things you are most interested in—the things you have on hand.'

For a moment she hesitated.

'Go on, please,' he remarked.

And she went on, helpless under his order.

'A busy, interesting life!' he acknowledged pleasantly. 'Apparently you get through things quickly!'

'There is no point in dawdling, is there?' she demanded.

He did not reply, but looked her up and down calmly. 'You have lost weight recently?'

'Yes; I ride a stone lighter than last year, thank goodness!' and she laughed.

'That is convenient, at any rate,' he commented. 'And now, Miss Holland, as I gather that you are quite a sensible person, I propose to use strong measures; we shall get what we want all the quicker by doing so. You agree?'

'I don't know in the least what you mean, Sir Wallace,' said Louie, seeking hard to control the tremor on her lips.

'Let me explain,' said the doctor coolly. 'I have decided to put you to bed for some weeks—how many depends upon yourself. I shall therefore arrange with your father for you to go to a nursing home at Sandlands-by-the-Sea, where the nurses are under my immediate instructions. I wish you to understand quite clearly that when there you will find yourself in absolute seclusion, and will not be allowed to receive outside communications of any description. You will give yourself up to the treatment prescribed, which will of course include massage and extra feeding. You will find the life exceedingly trying, and I am therefore relying upon you to pull yourself together to stand it and make a success of it. I shall be kept regularly informed as to your progress, and shall gradually relax the stringency of your treatment as I find you answer to it. I shall be in constant communication with your father. There is a good train which leaves Waterloo for Sandlands at three o'clock.'

The doctor spoke in swift, even tones; but at the first pause Louie rose and uttered a loud, hysterical laugh. 'I shall submit to nothing of the sort, Sir Wallace!' she exclaimed with lifted head and flaming eyes.

'Indeed!' he returned.

'But I can't! I absolutely can't go in for any mad cure just now,' she protested. 'Sometime perhaps I might'—so she temporised in face of the imperturbable expression on the doctor's countenance—'but—indeed I never lie in bed! Besides, I have so many compelling engagements, and—I never break engagements.'

'Sometimes engagements break us, as you have discovered, Miss Holland.'

'How do you know? I say this is madness!'

'Exactly. Therefore you are going to Sandlands,' and he touched a bell. 'Your father will be here in a moment, so do not distress him by showing quite useless opposition. Come, Miss Holland—your hand in proof that you have engaged to fight this thing through with me!'

'Oh, I really can't!' And she shrank back.

'Yet you agree that I am right?'

She looked at him and gave an involuntary movement of acquiescence. He rewarded her by a reassuring smile of commendation.

'So that is our engagement! And, as you say, I can quite believe that you are not the kind of person to break one.'

Louie put her hand to her forehead. She was flustered, excited, not altogether sure of herself. She felt that she was being whirled altogether out of reach of her ordinary personality.

Her father entered hurriedly, and looked deprecatingly at her.

'I congratulate you on your daughter, Holland!' said the doctor. 'She and I have made a compact which will end in her permanent cure.'

'She is one in a thousand!' blurted out the squire.

And suddenly, at her father's words, Louie leaned forward and wept impotently.

Sir Wallace watched her passively, and motioned to the squire to leave her alone.

'You are both brutes!' said Louie gaspingly, as she swiftly recovered herself.

'That is just it! That is exactly what we are!' exclaimed her father.

'Never mind, Miss Holland,' said the doctor. 'A few weeks, and your nerve will have returned to hunt us down. Now perhaps you will leave us, while your father and I make a few arrangements?' And again he touched the bell.

CHAPTER IV.

'I AM awfully sorry, little girl!' said the squire miserably as they spun through the traffic.

'Please don't apologise, dad,' said Louie, pride coming to her aid. 'I have read in sensational literature that nursing homes are convenient places in which to put away tiresome people. I congratulate you—all three of you!'

'Who is the third?' faltered the squire.

'Oh, you should know best!'

'You mean Charlie? No, Louie; I assure you that you are mistaken. Charlie has not the remotest idea that'—

'It is really of no consequence,' said Louie wearily.

CHAPTER V.

'IT is positively brutal'—cried Charlie.

'Exactly what Louie said!' groaned the squire.

'To shut her up with a lot of fiendish nurses

at liberty to boss her at every turn. Women never were made for exercising independent authority. She'll be sick and lonely, she'll get frantic, and then she'll go mad! The amazing thing is how you ever got her there, short of drugging her stupid.'

'That is the worst of it,' the squire admitted. 'Of course she would never have gone if she had not known at the bottom that she was unfit.'

Charlie rose restlessly. 'And I hadn't even the sense to see what was happening, blind fool that I was! So I rode high, and let my beastly tongue fly out at her like— Good heavens! Look here, Mr Holland; I positively must go down to her, or write, or do something to explain'—

But the squire interrupted him. 'No use. I know Sir Wallace. He'll throw up the case instantly if we play the interfering fool. I took her to the very best man I knew—you'll give me credit for that?'

Charlie turned and resealed himself. 'It is not you I blame,' he said. 'Only, how you had the nerve'—

'I don't know myself. And look, Charlie—that pile of letters, and her new horse arrived, and every one driving me frantic by asking me things, as if I knew! See, this is her last public effort;' and he drew out a sheet of paper. 'She wrote it in the train. Her "last will and testament" my little girl called it. Here are a thousand matters left to me to arrange and adjust. And as for the pageant, there is a meeting at the schools this evening, and every person I meet looks at me tragically as though I had committed a crime—as perhaps I have! I suppose the whole business will blow to bits now; and after all her work it seems hard.'

'Hang it all!' the young man burst forth, 'I can't go off to Scotland, fishing and enjoying myself, while she is grinding out her hours. Let me stay on here. You'll be getting letters, and the journey north has no temptation for me at present. I'll promise to clear out before she comes home.'

'Stay, lad; stay as long as ever you like,' said the squire with relieved heartiness.

A couple of hours later Charlie Mason strolled down into the village to learn what the world was up to at the pageant committee.

(To be continued.)

BOOT TROUBLES, AND A REMEDY.

By 'SKIPPER.'

IT has been said that it is the little things which have most effect in making our lives pleasant or the reverse; and, given the possession of prime necessities, such as food and health, there is certainly a good deal of truth in the proposition. Yet

so fierce is the strife for these prime necessities that we are content passively to enjoy or tolerate the effects of the little things, as though our efforts had left us with neither energy nor leisure so to order these details that they should each con-

tribute to our happiness. So we tamely bow to the dictates of Fashion, and wear whatsoever she and her myrmidons—the tailors, dressmakers, and bootmakers—ordain is to be worn; and of these shapers of form the last has surely the greatest power to harass or comfort squirming humanity.

Consider the modern boot, ready-made or made to order. How often does it fit? Seldom, I am afraid. We get boots new and comely, with a lambent polish and a general air of bringing comfort. We put them on and wear them, and for the first five minutes all is well. Then we become dimly cognisant of a little sensation somewhere. Perhaps our toes feel as if they were crowded together, or there is a slight tightness over the instep, or a tiny knob seems to have suddenly come into being, and is pressing into the back of our heels. No matter; it will be all right when the foot gets into the boot. The bootmaker said so; he knows—he is an expert. But it is not all right, and we spend the rest of the day in a state which may vary between slight discomfort and acute agony. Evening brings relief, and we taste the unholy joys of revenge as we remove the boots, and screw the trees hard into them till the leather creaks to the strain. Next day we take a rest from the newly acquired blisters or galls, and wear some old friends which are all right so long as it does not rain. When sufficiently recovered, we put on the new ones again, with similar but modified results; and in time the words of the expert come true, and our feet do 'get down into the boots.' In other words, our feet become callous, and the boots stretch, so that we are able to wear them all day without a subconscious feeling that we are the victims of some insidious evil. But when this happy state has been reached, we may find, to our grief, that the period of probation has been all too long, and that the soles are already showing signs of wearing through. We have then to choose whether to have them re-soled, thereby indeed renewing their life, but at the risk of losing the hardly earned 'fit,' or to discard them, and commence our troubles again with a new pair. Any bootmaker will cheerfully undertake to make a boot which shall fit, and most will profess to keep in stock ready-made all manner of sizes and shapes with which to fit any particular foot which may be presented to them. But though they make these professions in all honesty, believing themselves competent to perform them, it is a sad fact that they usually fail in execution.

Let us give the devil his due, and say that boots are capable of doing us very good service when they illustrate in actual practice the theoretical good points of the ideal. They save our feet from wear or injury underneath; they can keep out wet and snow as long as the leather remains non-absorbent; they add strength to weak ankles, and prevent many a strain and twist; and they give a very complete protection against injury from

above, such as the stamping of other feet or the more serious mishaps of dropped weights, and so on. On the other hand, the list of defects is a very long one, apart from those which have their cause in bad fitting. What is more depressing to the spirits and pretty surely to the vitality also than the matutinal drawing on of clammy boots preparatory to a plunge into the outside chill of a British winter? If the boots are dry and perhaps warmed at a fire by some kindly hand we feel no ill; but the unfortunate majority of us have to take our boots as we find them in the morning, and there is no need to dilate on the effects of beginning the day's work with mind and body below par. Incidental to the material and shape of our boots are the evils of damp and cold feet. Leather when at all old becomes absorbent of moisture, and boots once damp take several days to dry; this accentuates coldness of the feet arising from the inert state which the booted foot is tempted to assume when not actively employed in locomotion, and also from perspiration of the foot boxed up in its air-excluding cover. Both conditions are potent causes of ill-health as well as of discomfort. In warm weather, also, want of ventilation and restriction of movement result in our feet being unpleasantly hot, and the heat makes them swell and strain against their bonds. We rather pride ourselves on our cleanliness. Can anything be more unclean than our boots? Having trodden in them through the filth of the highways and byways, we thereafter bring them with us indoors, carrying on them throughout our houses particles of dirt, and leaving large or small deposits on every carpet and rug. As for the inside of a boot, it is enough to say that it is a garment worn practically next the skin, and never washed from the day it is in use till it is thrown away; and it is worn for hours at a time, not taken off and put on like a glove. Liability to chilblains is undoubtedly increased by the wearing of boots, and a pretty certain recipe for acquiring frost-bite of the toes is to wear boots which are at all tight when exposed for long to snow and severe cold.

It has already been remarked that boots tend to cramp the movement of the foot. Especially is this the case at the forepart of the foot, as is testified by our bent-in great toes and partially stunted and wholly ridiculous little toes, which in civilised feet have the appearance of being some superfluous survival, like the vermiform appendix. The settled conditions of modern life allow us to treat our toes with scant consideration, and the effect of these artificial deformities is not greatly felt. But Dame Nature had a well-defined purpose in providing us with toes; and when it comes to long marches, or swift movement on the flat or over rocky and broken ground, we find that bent-in toes soon put us out of the running. An army surgeon will tell us that a man who has lost some of his toes cannot march, and has to be

invalided out of the service; and similarly no man whose toes are crushed together by his boots can hope to keep going in a succession of marches of even average length, much less to sustain the fatigue of the forced marches which soldiers are sometimes called on to make. For work among rocks, hill-climbing, crossing moraines of boulders and such ground as may be expected in country of an alpine character, the free use of each individual toe is of prime importance, for by their agency the balance of the body is preserved or regained with much less effort than when they are crowded together, in which case the great muscles of the whole leg and trunk have to be called into play to effect the same result.

Whole books have been written on the subject of marching in the army, and minute regulations framed enjoining on officers the careful fitting of their men's boots, and the somewhat grandmotherly duty of inspecting every man's feet after a march. All this is because the boot is the most important equipment of a soldier after his arms and ammunition. And why important? Because its characteristics are such that unless scrupulous care is paid to its fit and softness it will hopelessly lame the wearer. The feet of the boot-shod soldier are soft, and he is unable to march barefoot; though he might do so within limits if time were given him to harden his feet, and if the enemy were kind enough to wait for him to do it. Once lame, he is compelled to seek refuge in the ambulance-wagon, and becomes a drag on the army instead of a factor of success. About 90 per cent. of the men who have to drop out of the ranks during a march do so from some form of foot-lameness due to the make of the boots, and not to any defect in their feet or legs *per se*; and a civilised army with boots which do not fit or which become worn-out and cannot be replaced is for all purposes disarmed until it gets new boots or learns to march without them. The hard sole and airtight upper leather are at the root of the whole evil; and, granting that footwear of some sort is necessary, it should be such as neither to demand special training to make the wearer fit to use it nor to make him so wholly dependent on it as to become helpless in its absence.

It is certain that each country tends to produce the kind of footwear most suited to local conditions. Europe is a country of agriculture and cities, with an abundant rainfall, and men found that a closed-in boot was a very suitable type for general use; but the original type has been degraded by the arbitrary decrees of fashion and the luxury of smooth city pavements. Its essentials are freedom and protection for the foot; but these are disregarded, with the result that our boots are unfit to be worn anywhere save in towns where vehicular transport is available to enable us to supplement their shortcomings. So much is this the case that if we go for a month's walking-tour in roomy boots, we find on return that our pointed town boots can

with difficulty be induced to admit the feet that have resumed their natural form.

Continental nations are either more practical or less studious of appearance than we are; and in several of their armies the boot is made large enough to allow foot-bandages to be worn, thus dispensing with the sock, which of itself tends to bunch the toes together and to wrinkle and wear into holes, and thereby cause blisters. The foot-bandage, in spite of its name, is not a bandage at all, but simply a square of soft flannel. It is worn by putting the foot down on it with the toe and heel pointing diagonally across the square. All four corners of the cloth are then drawn up round the ankle and the foot put into the boot. In comfort this appliance far surpasses the sock, as it is both warmer and cooler; and as it does not cling tightly to the foot it can be changed round if any parts show signs of wear, and it is easily and quickly cleaned. Its principal drawback is the difficulty of disposing of the loose angles of cloth that project above the boot. This has to be overcome by wearing a boot with a long top, of the shape known as a 'half-Wellington,' or by the use of a puttee or gaiter of some sort. Naturally the boot has to be somewhat larger, and consequently heavier, than one intended to be worn with the close-fitting sock. But even the use of the comfortable foot-bandage cannot obviate the defects that are inseparable from all boots; thus a nail coming through the sole, or boots too tight or out of repair, will put the wearer *hors de combat* just as surely as if he wore socks.

After so much adverse criticism, we ought to consider whether our condition would be bettered if we discarded our present form of boot and adopted some alternative; and here it may at once be said that such an upheaval is only contemplated because of its possibility, since there have been civilisations before ours which did not wear a boot. Naturally the first alternative which suggests itself is to do without any footgear and go barefoot. In the present condition of the world this is the happy privilege of young children and savages, but the innovation would not be popular. In the first place, our style of dress of either sex is not artistically suited to it. A bare foot projecting from a leg of the trousers or a flounced skirt would surely seem the height of incongruity; though it might be quite in keeping with some particular garb, such as a kilt or a hobble-skirt. Again, it requires a certain amount of training for our pampered feet to become capable of going unprotected. To cross a river-bed of rounded stones is a sufficiently painful undertaking for most grown-up people, while walking on fine gravel or sharp stones is a mild form of torture. Yet nature is ever ready to restore the efficiency which our boots have destroyed. A few weeks' gradual practice will make the softest feet quite hard enough to stand all ordinary work, and at the same time their sensitiveness to pain decreases,

and they become tolerant of collision with stones or pricks of thorns to an astonishing degree. They also acquire or regain an instinctive perception of what is likely to cause hurt, and, in fact, learn to look after themselves without close supervision by the owner. As is to be expected, the attainment of this standard of independence is not altogether free of penalties, and at first bumps and pricks will be painfully frequent unless the preliminary lessons are taken on flat and open ground or on the pavement. The weakness of the bare foot is found out when long distances have to be covered over hard or uneven ground, especially if the traveller is burdened, as a soldier is, with a weight in addition to that of his own body. The Zulus and other African tribes could cover enormous distances barefoot, but that was on the smooth grass of the veldt. Prince Charlie's Highlanders on the march to Derby looted shoes from every house. The bare foot must, therefore, be ruled out for general use; though it would be much more cleanly than our present arrangements, and much dirt and nastiness would be denied entrance to our houses if a trough of water and towels took the place of the filth-retaining door-mat.

If we continue our search for a substitute we find a fairly large field to explore. Even if we confine ourselves to present times only, there are many lands still unmolested by the boot whose inhabitants wear what seems most to suit their own habits and the nature of their country. The vote of Europe is practically solid for the boot. Tropical Africa goes barefoot; but in the grass-lands of the south the born Africander, who walks only when he cannot ride, has a partiality for the soft leather *veld schoen*. Again, in the rocks and sands of the north, the Mohammedans, also a race of horsemen, use the sandal or a loose shoe. Until America became a new Europe it wore the moccasin of soft leather suited to the forest and prairie. Now, of course, it wears the boot; but in winter the rubber snow-boot, or gum-boot, as it is called, is widely used as a protection against frost-bite and snow, though this is a very late adoption. Asia comprises many climates and many kinds of footwear. In the high, cold plateaus of Tibet a long boot of felt with soft soles is universal. China and Japan wear somewhat similar boots, with soles woven from rope or straw. Peninsular India wears loose leather shoes; but in the dry and rocky north and in Afghanistan the sandal is in common use.

Of all these devices, there is perhaps only one, the sandal, which could be copied or adapted to meet the needs of civilised Europe. Felt boots with woven soles may be comfortable, but they would be as unfit for outdoor wear in our damp climate as would the moccasin of half-cured leather, and our macadamised roads would soon wear such material to shreds. The loose-fitting leather shoe worn by the dark-skinned races of

India and elsewhere seems to combine the bad qualities of boot and slipper; it lets in the rain, has to be taken off if one wants to run, and sticks fast in muddy ground. It was largely worn by the native Indian army until a certain grand review at Panipat, near Delhi, when brigades and divisions marched past in pouring rain and left tons of shoes behind them. Since then the ammunition-boot is the wear of Jack Sepoy, who now suffers its inconveniences but does not lose it in the mud. This slipper-like shoe is a good example of how the characteristics of a race may be guessed from their footwear. It is the typical shoe of the Oriental, and specially of the Mohammedan. From it one surmises an indolent man whose normal pace is a slow walk, and who is prone to make the most of any chance of ease that may offer in a day's work. 'Hustle' and the purposeful walk of the busy man or the run to catch the morning tram are not compatible with wearing the Eastern shoe. On the contrary, those who wear it are to be found watching with 'patient, deep disdain' the boot-shod Occidental as he hurries on his unquiet way.

The sandal comes in a different category. Though usually regarded as markedly Eastern, it is in no way unsuited to an active life; nor indeed has it always been confined to the Orient, for surely it was in sandals that the Roman legionary marched over the world to conquer it and lay out those roads on which the sandal-shod citizens of the Empire had their comings and goings till the mighty fabric crumbled down into the ruin of the Middle Ages. The Greeks, too, used nothing in the shape of a shoe, but wore the sandal. Of the two, the Romans came nearest evolving a boot from the leather sock which it appears they wore in conjunction with the sandal; still, the combination was far from the modern laced boot. We may presume that Hannibal's mercenaries wore some similar device to protect their feet when they crossed the unexplored snows of the Alps; and Alexander's Macedonians wore sandals when they carried his victorious arms through the mountains and deserts of Asia Minor and Persia till they emerged upon the levels of India. If, then, the sandal sufficed for the feet of those who did such mighty pioneering while the world was young, it may perhaps, even in this softer age, be found not altogether unfit for our use. But as it is the simplest so it is the oldest form of foot-covering, and therefore has many fashions, from the rude artifice of the savage to the elaborate product of civilised artisans. The primitive form is a flat bit of bark or wood with a peg or a loop of rope or hide which is to be gripped between the toes. Hindus use this wooden sole in going about their houses to keep their feet clear of the mud and dust, but naturally it is not fit for work farther afield. In countries where dwarf palm or other fibre-producing plants abound, and where the natives have the art of spinning cord therefrom, a sole is woven

from this material and used as a sandal; especially is this the case in mountainous and rocky countries, where lightness combined with softness of tread and sure-footedness are matters of importance. Such rope sandals are largely worn by the natives of the Himalayan tracts of India and of Kashmir, in which latter country they are the invariable wear of the European sportsman in pursuit of ibex and other hill-game, as they are noiseless and do not slip on the snowfields or the more dangerous grass slopes where a mistake may mean death on the precipices below. But of course they wear out quickly, two pairs being the minimum for a day's work; and an indispensable member of the shooting-party is a man carrying a bundle of spare soles and a roll of grass-rope to bind them on to the foot when needed. A carefully made sole of jute cord is also much used by mountaineers in Europe in negotiating the cliffs on which they indulge their hobby. Except for such special work, however, the woven sole of any material must be put out of the counting, as it is not sufficiently impervious to wet.

The leather sandal avoids the defects of the woven sole while preserving its advantages. At first sight one is tempted to think that a leather sole secured to the foot by thongs of the same material should be a simple thing to make, and that one form would be as useful as another. But the method of fastening and, to a less extent, the shape of the sole vary greatly in different countries, and it is not easy to select one which could replace the boot in general use. There are also sandals with narrow thongs across the foot made by bootmakers in this country. These are sometimes inflicted by fond parents on their unoffending children to be worn at the seaside; and occasionally, if we are to believe our *Punch*, certain enthusiasts of the simple life may be viewed wearing them in the gardens of suburban villadom. Prolonged wear would soon dispose of the spurious claim of these to be regarded as true sandals, as narrow thongs would cut the flesh and lead to their being discarded. Perhaps the best form of sandal is one in which two tongues of leather project from the sole just in front of the heel, and stand up on each side of the instep. From these uprights two broad, longitudinally slashed cross-straps are led diagonally across the forepart of the foot and sewn down on the opposite edge of the sole so as to overlie the front of the instep and the toes. From the inner upright of each foot a heel-strap passes round behind the heel, and is secured by a buckle at the outer upright. This buckle replaces all our equipage of laces or buttons. To prevent the heel-strap slipping down behind, it is supported by passing through the looped ends of a strap which lies across the upper instep and ankle. This form of sandal is absolutely secure

on the foot, and may be worn on any kind of ground, as it gives all the attachments that are given by the uppers of boots. One weakness it has—the toes are not protected from the direct front. This has been overcome by giving the sole a pointed toe and sewing thereto a tongue of leather which is brought backwards over the toes and fastened to the crossed toe-straps. The toes are thus well protected from stones or thorns, but the space between the tongue then becomes a harbourage for mud if damp ground is crossed, so that this pattern is only useful in a dry climate. The only alternative is to leave the toes unprotected and let them fend for themselves. Reference has already been made to the fact that the foot quickly loses its sensitiveness if allowed freedom from the boot, while it resumes its instinctive faculty of avoiding hurt. If we were only content to avail ourselves of this provision of nature, there is nothing to prevent our using the form of sandal described; and the proof of this is to be found in the extent to which such sandals are actually worn by officers and others in the north of India at places where latitude of dress is permissible. The only drawback alleged against them is that the strap-pings are liable to stretch if thoroughly wetted; but this is due entirely to their being made of native-cured leather, and it would not happen if properly tanned hide was used.

The advantages of these sandals are very great, for they could be worn both in town and in the country. Compared with the boot they are clean and easily dried, can be put off or on more quickly, are simple to fit, strong, last longer, and, lastly, are much less liable to cause foot-lameness, as the whole interior is accessible, so that any rough part or projecting nail can be reduced with a penknife, whereas in a boot such things are often beyond reach, and necessitate the help of the bootmaker. From the financial point of view, the cost of manufacture and repair would be reduced, as less both of material and workmanship is needed.

Though the benefits are beyond all question, without trial being made we are unable to affirm that the sandal would be quite free from all faults in this climate of ours; but even if we were in a position to do so, the day is not yet when the boot could be displaced and supplanted by the sandal, for a mightier power than mere man upholds its supremacy. It is the voice of woman, which forbids the innovation or improvement, call it what you will. She will not consent to display her feet in sandals, and thereby forgo the joys of wearing dainty stockings and other frilled delights which require a natty boot or shoe as their supplement; and as long as this all-powerful vote is against the change the industry of worthy Northampton will continue to thrive and pinch our long-suffering toes.

THE OCEAN MOTOR-LINER.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

SINCE the oil-engine for propelling large vessels was last referred to in these pages great progress has been made, and at the present time more than fifty motor-ships of over one thousand tons carrying capacity are afloat or in course of construction. Of these vessels at least one-half have a tonnage exceeding five thousand tons, while their oil-engines range in size up to three thousand five hundred horse-power.

The first ocean-going motor-liner was put into service in March, and public interest in the use of oil-engines for propelling large ships may be said to date from the arrival of this vessel in the Port of London and her demonstration voyage to Antwerp. Since that time two sister-ships have been completed and put into service, together with several other vessels equal in size and power, while many oil-engined ships are now being built with a carrying capacity up to fifteen thousand tons.

No account has been taken of warships or vessels of under one thousand tons in recording this remarkable development. Our own naval authorities are stated to have ordered oil-engines of six thousand horse-power, and other nations are building motor-destroyers in considerable numbers; while for submarines the oil-engine is fast becoming universal. Then, again, hundreds of commercial motor-craft carrying less than one thousand tons are afloat or building; in fact, the smaller motor-ships have become quite common.

The motor-liner above mentioned and her two sister-ships were built for the East Asiatic Company to trade between Europe and the East, two of these vessels being constructed by Messrs Burmeister & Wain of Copenhagen; the third being built at Glasgow by Messrs Barclay, Curle, and Co., Limited. A description of the *Selandia*, the first of these ships to be put into service, will give a good idea of the arrangements in other large motor-vessels, although some alterations have been made in more recent equipments, which will be referred to later. Notwithstanding the fact that the *Selandia* would appear small compared to our huge Atlantic liners, she is a large vessel, her length being three hundred and seventy feet, and her breadth fifty-three feet, while she is capable of carrying seven thousand eight hundred tons, which, together with the weight of the ship and machinery, make up a displacement of nearly ten thousand tons. The *Selandia* is mainly intended for carrying cargo, hence her speed is only about eleven knots; but a handsome suite of saloons and berths is provided for some fourteen first-class passengers.

The chief interest in this vessel naturally centres round the engines, which work on similar principles to those of the ordinary motor-car,

excepting that they use crude oil costing about forty shillings a ton instead of petrol at one shilling and sixpence a gallon. The propelling is done by twin screws, one at each side of the rudder; consequently there are two separate engines, which together are capable of developing three thousand horse-power. Each engine has eight cylinders in a row, with eight cranks, and they are of such an enormous size that it is necessary to have two intermediate platforms between the floor of the engine-room and the tops of the cylinders. The engines run at one hundred and forty revolutions a minute—a slow speed which might be expected from their size—and they can be slowed down so that the ship's speed is reduced to about three knots. Starting and reversing are very quickly and easily effected by the aid of compressed air, only twenty seconds being needed to change the engines from full speed ahead to full speed astern. Both the pilot on the bridge and the engineers below are enthusiastic as to the quickness and certainty with which the engines can be made to respond to any manœuvring required for getting into docks or other awkward places; in fact, these oil-engines surpass the best steam-engines in this respect. As regards the actual starting from rest, it is impossible to give the necessary turn or two by hand customary with a motor-car, as something like one hundred and fifty horse-power is needed to give the first movement. Therefore this is done by compressed air at three hundred pounds pressure, which is admitted into the cylinders at the right moment, the pressure being continued for a turn or more until the oil begins to do its work. Each engine is started, reversed, or slowed down by a hand-wheel and a couple of levers; but so enormous is the gear that compressed air has to be used to change it over for going ahead or astern. The levers simply start small engines driven by air, which do what is necessary, so that only slight efforts are required from the engineer in control. The compressed air for all this work is contained in huge steel reservoirs, which are filled by compressors, the latter being driven by auxiliary oil-engines of several hundred horse-power.

As already said, the actual working of the engines is very similar to that of a car-motor, but there are two important differences. The car-motor sucks an explosive mixture of petrol vapour and air into the cylinder as the piston goes down, this mixture being compressed by the piston on its next up-stroke, and fired by an electric spark at the top, when it explodes and drives down the piston and thus turns the crank.

In the Diesel engine installed in the *Selandia* the piston sucks in a charge of air only as it

descends, the oil being sprayed into the cylinder at the top of the next up-stroke after the air has been compressed. The compression is so high (five hundred pounds) that the air becomes what we may call red-hot, and immediately ignites the oil-spray when it is injected. Almost every cyclist will have noticed the heating of the pump in the hand when blowing up a tire, and similar effects take place in a Diesel engine cylinder, only with very much greater heat owing to the high compression. Therefore we do not require an electric spark for ignition, and there can be no failure to ignite when the oil is sprayed into air at this high temperature. The oil-spray, however, needs air at nine hundred pounds pressure to blow it into the cylinders, and air is compressed for this purpose by a small compressor on each main engine.

The only important development since the advent of the *Selandia* is the adoption by several makers of what is called the two-stroke engine in place of the four-stroke type. Each piston in the latter draws in a charge of air as it goes down, which is compressed on the up-stroke. Then the oil is forced in and burns with an intense heat which expands the air and drives down the piston, thus giving power to the engine. The burnt gases are blown out of the cylinder after the piston comes up again, when it is ready to draw in another charge of air for the next 'cycle.' The above operations only give one working stroke in four, as the name 'four-stroke' indicates. In the two-stroke engine the piston uncovers two holes or ports in the bottom when at its lowest position. Fresh air is blown through one of these holes and sweeps out the burnt gases through the other, thus leaving a charge of air ready for being compressed on each up-stroke. The oil is forced in at the top of the up-stroke as before, but in this case each up-stroke compresses air ready for burning the oil and driving the engine during each down-stroke. Thus we have a working-stroke in every two, and the engine has double the power for the same size. Of course pumps for blowing the air into the cylinders are needed; but, although they are of considerable size, the construction is very simple and very little power is required to drive them.

A good many four-stroke engines are being built as well as two-stroke, but the latter now seem to be more in favour.

The advantages of oil-engines over steam propelling machinery are very great. As the boilers are entirely done away with and stokers are not needed, a very large amount of space is thus saved, which can be used for carrying extra cargo, while the saving in wages comes to a considerable sum. Then, again, the weight of fuel oil is only about one-fifth the weight of coal required to drive the vessel, and it can be carried between the inner and outer bottoms—a space which would otherwise be wasted—instead of in

bunkers which must necessarily take up cargo-room. Furthermore, in a steam-vessel of this size some four coal-trimmers would be carried to trim the coal into the shoots ready for the stokers, the wages of these men being entirely saved.

Taking in oil fuel by a pipe is a very simple and clean operation compared with coaling; moreover, owing to its value in driving the vessel many thousands of miles on a comparatively small amount, sufficient oil for a complete voyage out and home can be carried; hence it is possible to buy fuel in the cheapest market. The *Selandia* carries nine hundred tons of oil, which will drive her twenty thousand miles; and she can refill at the Eastern ports, where oil is cheaper than in this country. Less important advantages include the absence of smoke and funnels, the exhausts from the engines being taken up one of the masts, which is in the form of a steel tube. Then the dust and dirt from coal and ashes, which are such a nuisance on steam-vessels, are abolished.

The risk of disablement is also much less with oil-engines, as there are no fires to be put out by water which may find its way below in strong gales. Owing to the fires having been put out, many a steam-vessel has been lost which would have reached port safely if the boilers and engines could have been kept at work. Only a short time since the funnel of a steamship was washed overboard, leaving a hole through which the seas swept in and put out the fires, resulting in the loss of the vessel.

Last but not least must be mentioned the ability of an oil-engine to start at a few minutes' notice in place of the many hours required for raising steam in a steamship.

The engines of the *Selandia* are small compared with those of our biggest liners; but experiments with larger cylinders have shown that there is practically no limit to the power which can be obtained from oil-engines.

Very great interest was taken in the *Selandia* by the Admiralty and our large steamship companies, the vessel being visited in London by the First Lord and many representatives of famous lines, some of whom, including Engineer Vice-Admiral Sir Henry Oram, made a trip to Antwerp in her.

Although we have allowed foreign nations to take the lead in this matter, more than a dozen British firms are now building large marine oil-engines, and there is no doubt that in a few years we shall again take our proper place in the van of shipbuilding development.

A LOVER'S FEARS.

AT times I dare not raise my eyes to thine,
Lest you should see with what a light they shine.
At times I dare not even touch your hand,
Lest you should feel mine thrill—and understand.

PETER ANDERSON.

Chambers's Journal

SEVENTH SERIES

FRESH LIGHT ON CHARLES DICKENS.

By Sir HENRY LUCY.

AFTER reading Mr Chesterton's book on Charles Dickens, published six years ago, it seemed that the last word had been said on the fascinating subject. Mr R. C. Lehmann has proved that the estimate was misleading. His *Charles Dickens as Editor* (Smith, Elder, & Co.) presents in detail a close and intimate view of the novelist only touched upon in earlier works. From his great-uncle, William Henry Wills, who for something like a score of years worked as sub-editor on *Household Words* and *All the Year Round*, Mr Lehmann has inherited a large collection of letters written by Dickens, chiefly upon the business of his weekly paper.

Having founded *Household Words* in co-partnership with the firm of Bradbury & Evans, who published it, Dickens, who underneath habitual geniality of manner nourished a strain of occasional implacable animosity, quarrelled with them because *Punch* refused to give up one of its pages to the circulation of a letter explaining and vindicating the novelist's separation from his wife. In opposition he started *All the Year Round*, which speedily achieved the success instantly attained by the first venture. At the period covered by the letters to Wills, Dickens was at the zenith of his fame and in the full tide of his deathless work.

What is surprising to find is the manner in which he turned aside from his supreme, engrossing labour to bend the whole of his tremendous energies for the moment or the hour upon the current number of his periodical. He supervised its make-up, read all the proofs, not infrequently rewriting columns and pages. After reading these often scrappy letters, written under high pressure, one feels that howsoever wide his range of study, he never before knew the man Dickens.

The connection of Wills with Dickens commenced on the launching of the *Daily News*, to whose sub-editorial staff Wills was appointed, with the pleasanter duty of acting as private secretary to the editor. At page 4 of the volume there appears a photograph of Wills in the costume of the period. His clothes, more especially about the legs and arms, are fashioned in voluminous manner suggesting either that they were made for a man of more massive mould or that the owner had grievously shrunk in bodily frame since he was measured for the suit. Over

a continuous fringe of whisker and beard there beams a kindly face. On the table at his elbow is advantageously set a tall silk hat in shape and size depressingly suggestive of a tombstone. A few letters written during Dickens's brief editorship of the *Daily News* were preserved by the faithful secretary. I read one with peculiar personal interest. The first number of the *Daily News* appeared on 21st January 1846. On the 4th of February following, an interval of exactly a fortnight, Dickens writes to his secretary to inform him that he 'dines out to-morrow, Wednesday, and next day, Thursday, and shall not be here either evening until rather late. I shall not be here generally on Sunday night.'

When I was editor of the *Daily News*, a position hallowed by association with Dickens, I early fell into the habit of leaving town on Saturday morning, not reappearing at the office till Monday. It certainly was not a condition upon which the editorship of a great morning paper could be successfully carried on. I confess that in yielding to the temptation I, with judicious reticence, felt guilty. It is a relief to find illustrious precedent for the slackness. It is apparent from this letter that already in the first fortnight Dickens was beginning to feel uncomfortable in the fetters of the editorial chair. Five days later, on the 9th of February, he resigned an editorship that lasted something less than three weeks. For eighteen months I struggled on through uncongenial work reluctantly undertaken. By an interesting coincidence, Mr Lehmann was also for a while editor of the *Daily News*, filling the chair for a period longer than was possible to Dickens, but not reaching the full length of my own achievement.

It was in 1850 that Dickens, realising a project over which he had long brooded, established *Household Words*. It was a weekly paper issued at the price of twopence. Writing to Mrs Gaskell on the 31st of January in this year, Dickens describes his new venture as 'a cheap weekly journal of general literature. No writers' names to be used, neither my own nor any other. Every paper will be published without any signature, and all will seem to express the general mind and purpose of the journal, which is the raising up of those that are down and the general improvement of our social condition.' In the

proprietorship of the magazine Dickens conjoined the printers and publishers, Bradbury & Evans, who owned one-quarter share, John Forster one-eighth, Wills one-eighth, Dickens retaining for himself a full half-share. In addition to this handsome share of the profits, he drew a salary of five hundred pounds a year as editor, with payment for any literary articles he might contribute. Wills, in addition to his share of the profits, had as sub-editor a weekly wage of eight pounds. It was stipulated in the generally business-like agreement drawn up by the editor that, in consideration of his share of proprietorial profits, Forster should contribute literary articles without additional remuneration. This loosely constructed clause naturally failed in practice, and after brief experiment Forster relinquished his one-eighth share, remaining an occasional contributor on ordinary terms of remuneration.

Dickens had a great idea of the value of a title as a condition of a successful literary enterprise. His fancy was rich in suggestion. Among his correspondence, Wills treasured two slips of paper on which in the chief's handwriting are jotted down a number of titles for choice. Here they are: 'The Hearth,' 'The Forge,' 'The Crucible,' 'The Anvil of the Time,' 'Charles Dickens's Own,' 'Seasonable Leaves,' 'Evergreen Leaves,' 'Home,' 'Home Music,' 'Change,' 'Time and Tide,' 'Twopence,' 'English Bells,' 'Weekly Bells,' 'The Rocket,' 'Good Humour.' It will be observed that the title finally selected does not appear in this list. Dickens's favourite at the time was 'The Forge.' He pleased himself with setting forth this title in full form, with a quotation from Longfellow that had suggested it:

Thus at the flaming FORGE of life our actions
must be wrought,
Thus on its sounding anvil shaped each burning
deed and thought.

THE FORGE.
A WEEKLY JOURNAL,
CONDUCTED BY CHARLES DICKENS.

Dickens devoted himself with characteristic energy to launching and successfully floating his new venture. It was of itself sufficient to engross the full time of a man, howsoever capable of continued effort. Actually it was a supplement to the planning and writing of what is perhaps his greatest novel, *David Copperfield*. Dickens never did anything by halves. He threw himself into his new work with a concentration of energy that could not have been excelled if not merely his daily bread but his life depended upon its success. He not only liberally contributed to every number of the magazine. He supervised the list of contributors, read every proof, severely corrected them, occasionally rewrote columns of an article which, failing the magic touch of his hand, must needs have been rejected.

He was particular even to punctuation. Writing to Wills from Broadstairs on the 30th

July 1851, he says: 'I have gone through the number since returning home. Again I observe one or two of the articles in a very slovenly state, both as to the Queen's English and pointing. I have not had time to set them quite right. I wish you would look at the proofs I have sent Greening.' Ten days later he writes again from his beloved seaside retreat: 'In the "May Festival" of Miss Howitt (very good), for the Lord's love don't let us have any allusions to the Great Exhibition. Make the first sentence the first paragraph, and then go on with the second paragraph as it stands. Also substitute names for those initial letters, Mr G., and the like.'

Further quotations from his weekly letter to his sub-editor illustrate how this man of supremest genius, with Steerforth and the quaint homestead on the shingle at Yarmouth on his mind, and Mr Micawber to be provided for, focussed his attention on the lack or superfluity of a comma, the construction of a sentence, or the arrangement of a paragraph: 'In Horne's "Ballooning," always insert "Mr" before "Green." Also, insert "Mr" before "Poole," and call him "the well-known author." At the end of the third paragraph from the commencement, instead of "fanatical sentence was carried into execution," read "sentence of the Holy Catholic Church was carried into Christian execution." In the "London Tavern" *dele*. "The actor Macready." Mrs ———'s story would be very good now, I think. It would be as easy almost to write one as I found it to get point and terseness out of such an infernal hash.'

His generous habit of spending himself upon the efforts of others, often obscure, writers is illustrated in a letter to Wills returning a story eventually printed: 'An alteration occurs to me—easily made—which I think would greatly improve it, in respect of interest and quiet pathos, and a closing sentiment of pleasure to the reader. It should be delicately expressed that the man (admirably described) who comes a-courting Miss Furbey is the old lover who has always been faithful. I think Miss Furbey might have always had a miniature of him hanging up or in a pet drawer, and sometimes brought out, taken when he was a young man; and that when the narrator begins to observe him and his visits she should still see in the gray hair and the worn face something of that portrait.'

When dealing with leaders for the *Times* Delane was accustomed to add illuminative sentences, but not to the extent to which Dickens habitually devoted valuable time. To a man less loyal in disposition, less phlegmatic in temperament, than was the sub-editor of *Household Words*, the arrival of the weekly letter from an implacable chief must in course of time have grown unendurable. One letter, dated from Boulogne, 5th August 1853, fairly

illustrates Dickens's editorial method: 'In the first place, the No. is an awfully and solemnly heavy one; and, if you have any kind of means to that end by you, must really be lightened. I read it last night, and had a nightmare. I doubt if anything so heavy (except stewed lead) could possibly be taken before going to bed. Ist, "Justice to Bears." The name won't do. We have already had "Justice to the Hyæna." "Brother Bruin" would be a capital name, I think, thus introduced: "The bear symbolises savage and primitive equality, and is therefore the aversion of the aristocracy." Such is the clue to ursine facts, according to *Passional Zoology*, which subject, and M. Toussenel's treatment of it, we now resume. It would appear that Mr Sneak, in "The Major of Garratt," had much reason in him when he addressed the rough personage of the piece as Brother Bruin. Was he not a Bear and a Brother? Then read the proof—you, W. H. W.—with an eye to this fact, that it wants to be made clearer all the way through, that it is M. Toussenel who is speaking, and not H. W., conducted by C. D. Secondly, the first stage to Australia. There is a forlorn attempt at humour about the Deputy Inspector-General (page 584) that cannot be too ferociously decapitated. Pray have nothing about a detective in that direction; it looks like weakly and palely hanging on Mr Bucket. Damn "here they are" at page 585, and dele. it too. "And the onus of the idea task strangles every newly born smile that struggles for existence," and at page 584 again, strike out with a pen of iron. Look at the whole paper. If "The Glimpse of Dublin" be not by Allingham, strike it out. If it be, hold it over. "Gore House" is very poor. Page 591, first column. Stop at the Graces, and dele. the rest of that paragraph. It is Skimpole, you know—the whole passage. I couldn't write it more like him. I have forgotten "Licensed to Jungle." Look to the slang talk of it, and don't let "Ya" stand for "You." "The Stereoscope" is dreadfully literal.'

But though ruthless, relentless in tone when dealing with editorial matters, Dickens had a soft place in his heart readily touched upon occasion by his colleague. On 27th October 1854 he wrote from Tavistock House:

'MY DEAR WILLS,—I am truly sorry to hear of your poor mother's death. What you said last night had prepared me to receive the sad news; and when I was told of a messenger being sent here to inquire for you this morning I felt that the end had come. Don't worry yourself about a first article for the next No. I will have one ready, please God. Mrs Dickens and Georgina unite with me in kindest regards to Mrs Wills. Pray let me say that if in this sudden emergency you want any ready-money I shall consider it a breach of the confidence and friendship between

us if you seek it in any quarter where you have to pay interest for it.'

As a collaborator, Wills was a heaven-sent man for Dickens. Shrewd, practical, business-like, he with infinite pains guarded the interests of his chief and of the property they jointly held. As the letters quoted testify, communications passing between them were almost exclusively of a business character. Once or twice Dickens varies his contribution by allusion to a little joke he had elaborated, and to which he turned with keenest delight. He invented the story that Wills had written a nautical drama named *The Larboard Fin*, a delightful title which probably Dickens occasionally regretted should be wasted in private persiflage. He writes to Wills from Paris in November 1862: 'Your idea of our title being "taken hold of by sharks and pirated"' (see *Larboard Fin*) has also come into my head.'

He did not hesitate upon occasion to make use of Wills outside his editorial functions. When there came to hand undesirable letters or proposals for interviews he put him up to reply. A characteristic example of this method is supplied by a letter written from Gad's Hill on 28th January 1866. Dickens was contemplating a fresh course of lectures, but thought it judicious not to appear eager to accept overtures made to him. He accordingly in a diplomatically casual sort of way puts forward his friend Wills.

'I would take up the ground thus,' he writes: 'There is Mr Dickens, whose position you understand probably at least as well as I do, constantly entreated to read, and proposed to in all manner of ways. He is enough at leisure to undertake in town and country [suggesting the country places] 30 readings, or 20 or 15. The business of such things is not in our way since the death of Mr Arthur Smith. He is willing to undertake them for a sum of money. Are you willing to enter into a negotiation with me for buying him?' I would lead it to an offer if he should be disposed to make one, but I would throw the terms of it in money upon him.'

This artless manoeuvre devised for the capture of the agent did not lead to business. Elsewhere during the same year Dickens personally made a series of advantageous contracts. I have access to a private collection of autograph letters addressed to a rival agent, Mr Chappell, and am permitted to make excerpts from them which illustrate the rare combination of business capacity with the highest form of imaginative art. Writing to Mr Chappell on March 1866, he said: 'I am happy to accept your offer of fifteen hundred pounds for thirty public readings in London, the provinces, or elsewhere, as we may agree. Payment of the fifteen hundred pounds to be made—£500 on the fifth of April next, £500 when fifteen readings shall have been

given, and £500 when the whole number of thirty readings shall have been given.'

The readings proving a success, he, writing again in August of the same year, runs up the price by ten pounds a lecture. 'I am prepared to dispose my time and occupation in advance so as to read again after Christmas. I will engage with you, if you like, to read 40 times at £60 per night, and all expenses paid as before, *including my hotel charges*; or, to make one contract for an even sum of money, I will engage with you to read 42 times for £2500.' The italics are the occasionally prosaic novelist's.

In November of the following year the fee further advances. He writes: 'Always understanding, as you and I understand together, that Dolby has his ten per cent. from you, I readily accept your terms of £80 per night for the Farewell Readings at home, provided they extend to 100 in number.' Here on a single engagement is a fee of eight thousand pounds, a record in the lecturing business, at least in this country.

Dickens's wonderful memory and his orderly precision in matters of detail are illustrated in a letter written from Boulogne to his faithful factotum left in London to watch over business affairs. 'I have nearly exhausted the cigarettes I brought here,' he writes to Wills. 'Will you use the enclosed key to open the drawer in the round table you opened before—take out the same bunch as before—find another key on it that opens the corresponding table nearest to the drawing-room, and in a drawer (I think the middle drawer on the left-hand side, nearest to the sliding book-door) you will find a cigar-box with bundles of cigarettes in it?'

Dickens, penning his voluminous correspondence with his own hand, always used blue ink, a fashion adopted and observed to the end by one of the most successful of his young men, Edmund Yates. Another mannerism never omitted was to write at full length the date of his letter. We young or old men in a hurry, having occasion to inscribe a letter with a particular date, would write 30/7/51. Dickens, with a novel in hand, with the oversight of a popular magazine, and one or two contributions for its pages, wrote, 'Wednesday night, Thirtieth July 1851.'

Another peculiarity notable in his correspondence with Wills was his arrangement of paragraphs, as thus:

'XMAS No.
we will, please God, settle together here.

ALL
well. I expected to have heard from you.

WEATHER
charming. With cool breezes.'

In the course of his editorship of *Household Words* Dickens discovered several theretofore unknown literary lights which, thanks to his

sympathy and training, in due time shone brightly in the firmament. Among them were Sala, Edmund Yates, and James Payn. The first reference to Sala appears in a letter written to Wills from Broadstairs in September 1851. 'I have gone through Mr Sala's paper,' he writes, 'and have cut a great deal out and made it compact and telling. . . . There is nobody about us whom we can use in his way more advantageously than this young man. It will be exceedingly desirable to set him up on some subjects.' Thereafter he constantly suggests topics for the young recruit. He early had occasion to criticise Sala's work, but in the main stood by him. In August 1854 he wrote: 'Sala is very good. Don't run him too close in the money-way. I can't bear the thought of making anything like a hard bargain with him.'

This was a disposition that exactly suited Sala. Habitually impecunious, he often drew in advance payment for articles yet to be delivered, a tendency Dickens, always magnificent in money matters, winked at. In course of time he grew tired of this tendency, a stage marked in a letter to Wills, dated Christmas Eve, 1856. 'Will you,' he said, 'represent to Mr Sala the necessity and vital importance—quite as much to himself as to *Household Words*—of his being punctual and faithful in the performance of the work he has undertaken? Pray take care that he distinctly understands, beyond all possibility of misconception, that he can have money from you while he is at work, as he wants it; and that when we come, on the completion of "Due North," to close our accounts, I shall arrange all things with him for his advantage in exactly the same spirit as if he had not given me occasion to decide that *Household Words* must not do him the injury of accepting any further service at his hands.'

This polite but peremptory epistle remained operative through a period of two years. At the end of that time Sala was reinstated in favour, and regularly contributed to *Household Words* and *All the Year Round*. The quarrel arose in connection with Sala's desire to republish in book-form articles descriptive of a visit to Russia undertaken under the direction and at the expense of Dickens.

Edmund Yates appears upon the scene in 1859. At this time *All the Year Round* was firmly established in public favour. Among its features was a series of paragraphs on matters of current interest appearing under the headline 'The Register.' In April of this year Dickens writes to Wills: 'It occurs to me that for this purpose Edmund Yates is likely to be very useful. He reads all the newspapers and periodicals, and is smart.' Yates accordingly became a contributor to this scrappy column, unconsciously serving apprenticeship for the elaboration of a prominent feature in his own paper, known as *What the World Says*. In

course of time Yates won his way to an intimacy with the chief exceeding in warmth and closeness that accorded to Sala. This friendship was tested when there happened the famous episode at the Garrick Club which led to the expulsion of Yates and severance of acquaintance between Thackeray and Dickens.

James Payn is first mentioned in the correspondence in 1856, when Dickens suggests he should 'go round for a walk to a number of the old coaching-houses and tell us what they are about now, and how they look.' In this first reference to a delightful man of letters Dickens spells his name Paine. It is well the sometime editor of *Chambers's Journal* did not live to see the error in print. He was peculiarly sensitive on the point. Very early in a friendship whose memory I cherish, I in my ignorance addressed him as Payne. He wrote quite a long letter of serious rebuke and protest against this orthographic enormity.

Payn's first contribution to *Household Words* is entitled 'Gentleman Cadet,' being a sketch of life at the Woolwich Academy. In his *Literary Recollections* Payn wrote: 'When I received the honorarium (three guineas) for my little paper it seemed to me that fame and fortune had both opened wide their gates to me.' In a burst of ill-requited generosity he invested the money in

the purchase of a Berkshire pig, a gift for his tutor in Devonshire, where, he protests, 'there are no pigs worthy of the name, only a kind of dog with a pig's skin on it.' Returning to his studies in Devonshire after a summer vacation, he packed the pig in a hamper and took it with him for presentation. It was a sultry day in August, and on arrival of the train at Bristol it occurred to Payn that his precious burden must be thirsty. With the assistance of a porter they lugged the hamper out and opened it in convenient contiguity to a pan of water. 'There was a cry of panic, rage, and fear—a squeal is no word for it—a broken pan, a prostrate porter, and a mad pig gone! . . . The next moment the creature was in the market—the "open market," as it is called, but altogether out of my reach. He had joined a great band of pigs (although the owner denied it), and identification was out of the question. Such was the fate of the pecuniary proceeds of my first article.'

This slight sketch and the quotations that illustrate it will serve to show how rich is the treasure-trove discovered by Mr Lehmann, who by careful and skilful editing of a precious parcel of letters hitherto unknown to the public discloses aspects of the real Charles Dickens viewed from bypaths untrodden by his more voluminous biographer.

THE SHIP OF SHADOWS.

CHAPTER V.—AT THE WRECK.

THE path hesitated, stopped, and lost itself in the heather. I intended to cross the hill, then to come home by the sand; but I have rarely stuck to my charts or original plans in life. I changed my mind.

I had nearly reached the granite scalp of the hill, and turned to look down at the Firth. The tide was out. The sky's arc, blue and cloudless, bent down to the distant English coast and the thin ribbon of sea twinkling in an opalescent haze in the heat. The wide expanse of sand glowed like some Gargantuan harvest-field, the limner of my fancy tracing stooks and their shadows, long stretches of stubble, bright battalions of standing corn. As I looked, my wandering eye caught a tiny streak, dark against the sunlit canvas. A wreck! My memory leaped back to the far-away morning when the mysterious schooner lay down to her long sleep, for from its situation I guessed that the little, dark blotch might be the skeleton of *The Agnès Rose*.

A whim, growing into a desire, seized me, and in a short time I had made the descent by the cliff path, crossed the sands, and was standing beside the weather-scarred hull of the wreck. Hull it scarcely could be called, for there was little left of her beyond her ribs and spine,

picked clean by the tireless gray wolves of the sea.

I looked at her, a great pity in my heart; for, of all things inanimate on God's earth, none calls to me so wistfully as a dead ship. She that had felt the quick life thrilling in her sails, had listened to the sea's music at her forefoot, welcomed 'All's well' and far harbour-lights after the thunder of the gale; whose tall spars had carried the red ensign of Britain countless leagues, now lay in dissolution, her work done, lonely, broken, forgotten; lingering with her, as with all wrecks, whether of poor humanity or the great waters, the very note of tragedy.

The sand half-covered her. Part of the stern, the broken lines of the port timbers, and the remains of her bows were visible. Her deck and starboard side had gone, and she was stripped to her keel by the seas. But for the rusty rivets sticking up as in a gigantic pin-cushion, and the great brown clusters of seaweed clinging to her, she was as empty as a shell.

Suddenly I became aware that I was not alone. In the shadow thrown by the stern a man was sitting, his back against the wreck, his head forward, chin on one hand. He was staring seawards—sadly, I thought. I had made up my mind to speak, when he heard my footsteps and

rose slowly and deliberately. The sand clung to his clothes, but he did not trouble to shake himself. Curiosity to see what manner of man it could be who chose to meditate near the old wreck prompted me to give him good-day. He replied readily and politely in a pleasant voice. We were soon on a stream of small talk. Rather, I should say, I was, for I found him, I thought, shy and constrained. He allowed me to do the talking.

I had time to take a good look at him. Medium height, slim, with an oval, sunburnt face a trifle too small for the good, straight forehead and the fine eyes, large, deep blue, but sombre. Mentality of some sort was written on him. His hands and nails were well shaped and unmarked by manual labour. His features touched delicacy—in them an indefinable note of distinction. He was scrupulously clean-shaven. His clothes were clean, but shabby and rustic, a contradiction to his face, speech, and carriage; his collar was clean but frayed, and one of his boots—sure financial weather-gauge!—had a hole in it; but the man carried these insignia with an air that invited and defeated speculation.

I took out my case and offered him a cigar. He accepted it almost eagerly, with a word of thanks. Then he cut the Habana with care and knowledge, and lit up. As the incense stole over him his eyes shone.

After a moment or two, 'This is a Quileña,' he said in the exalted voice of a celebrant. My estimate of him went up like mercury.

'It is,' I said, with, I hope, modest satisfaction, for I prided myself on my judgment in cigars.

'I was sure. There's no mistaking them, for the once initiated. And I knew them—once,' he said quietly. He smoked like a gentleman.

I looked at him again. He had taken off his cap, and above the tan-mark on his brow the clear white skin showed traced with most delicate blue veins. This man had not always worn village reach-me-downs and doubtful boots.

I turned the talk to foreign travel, in which I had taken some part. My companion visibly thawed a little, and a casual mention of a recent book brightened him. The conversation ran on, an *olla poirida* of men and affairs, books, and gossip; but I still had to do most of the talking.

Thus we sat for perhaps a quarter of an hour. Then, 'You know these parts?' he said, after a remark of mine about the Solway.

'I did; but 'tis fifteen years ago since I've seen the Firth. I walked out to the wreck here to please a whim, for I was one of the few who saw the schooner come to her last anchorage,' I replied. 'I've often wondered what the story of *The Ayrshire Rose* is.'

'Story!' he repeated. 'Story!'

He was silent for a moment or two. I was not quite sure whether the words were intended for me or whether he was thinking aloud.

Then, 'Do you mean to pay a long visit, may I ask?' he said.

'Unluckily, no. I'm a guest at my cousin's place over there; but I'm off on the wander in a day or two. Heaven knows when I'll see the old spot again!'

Again he kept silent.

'Then you say that you saw *The Ayrshire Rose* strand?'

'I did. There was nothing living on board except a couple of hens and a collie-dog,' I said.

'Yes, there was the dog,' he said half to himself.

'You know about the wreck, then?' I looked at him.

'I—well—I—I know,' he said jerkily, and stopped short as one who has said too much. I did not press him. Neither of us spoke.

'Would you care to hear her story?' he suddenly said at last, laying a hand on the wreck. 'Did you hear *nothing* about her?'

'Not a syllable, and I am rather interested.' 'Rather interested!' I was on tenter-hooks to hear the story, and afraid that he might change his mind, for he was silent again, and I knew that he took a swift glance at me.

'Well,' he said, after a minute or two of revelling in the bouquet of the Habana, 'this is good. Luckily there's no wind to mar the flavour.' I liked his voice. He brushed the sand off his clothes, smoking in silence for a time, gazing abstractedly seaward, and then turned to me.

'I call her *The Ship of Shadows*. If you would like to hear the story of *The Ayrshire Rose*, and how she sailed up here alone, I'll be glad to tell it to you.'

'Thank you.'

'I am the only one who can tell it—the only one alive, I think,' he continued quietly. A faint flush showed for a moment under the sunburn of his face.

As I have said, I wanted to hear the story, and I told him so. After a moment's hesitation he said, 'I'm truly sorry, but I can't wait longer to-day. I am due elsewhere; but if you are really interested I can meet you to-morrow.'

The upshot of our talk that day was that a rendezvous was suggested, and he readily agreed to meet me under the Gled's Rock next day, after the turn of the tide.

CHAPTER VI.—'THE BERWICK LAW' SOHOONER.

NEXT morning my acquaintance of the wreck punctually met me at the foot of the cliff. We strolled over the sands to the wreck. I was instantly struck by some subtle change for the better in him. The listlessness I had marked on my first meeting with him had gone. He was strangely younger-looking, more alert, better dressed. His eye had lost its sombre look, and was lively as a bird's. Instead of waiting for

me to speak, he literally led the conversation. In his speech, just touched and no more with the pleasant Lowland accent, and in his bearing, lay that elusive something vaguely labelled 'good form.' There was nothing obtrusive, no jarring note of the professional talker. The talk rippled on, from my travels to books, and here he showed such width in his reading, such freshness and originality in his views and criticisms, that I was surprised and delighted. I had no right to be surprised, of course—I had been judging the man too much by his boots. Horace and the moderns, Shakespeare and Sardou, were on his lips. I willingly did most of the listening, and the half-hour over the sands seemed only a few minutes.

We reached the wreck, and I clambered over the battered starboard timbers and looked for a seat aft.

'No, not there!' he said hurriedly; 'not there! I'll tell you why afterwards.' I followed him forward, sat down beside him on the remains of the battered bows, and produced the cigars. Then he began his tale, thus:

'How I came, years ago, to be in Trinidad does not concern my story much. How I got out of the island does, for on my return journey to the Old Country I fell in with David Gerrand and Eric Lowden, and a woman. No, I wasn't in love. But lovers she had, and one at least to spare. And here I must tell you that beyond what you'll hear, I have no knowledge, nothing beyond mere guesswork, of the people in the story, of their previous history, or the hidden springs that shaped their lives.

'I remember a lazy afternoon—just such another as this, only, of course, hotter—in Port o' Spain. I was sauntering aimlessly enough along the wharves, with my hands, and precious little else, in my pockets. I had been burning the candle at both ends, I may as well confess; and, however much this process may yield in additional illumination, it makes the darkness immediately afterwards several degrees blacker than pitch—so dark at any rate that your friends can't see you. My only relatives were far-out ones, the breed of feminine males and female nonentities—broadcloth and black beads—who regard roaming over the world as the first step on the slope of Avernus. You can guess the sort. They don't want letters from you, and remark on your neglect if they don't get any. They hope for the best and believe the worst. Perhaps you know?'

I nodded, and quoted:

'When I ha'e a saxeunce under my thumb,
Then I get credit in ilka town;
But when I am poor, they bid me gang by—
Oh, poverty parts good company!'

'That's about it,' he went on. 'So it was with me, I thought, as I fingered my last nickel and watched the gangs of chattering niggers on the wharves. The clamour and the flashes of

bright colours reminded me for all the world of the parrot-house at the Zoo. Nothing equals a West Indian crowd for unnecessary noise. The less work they are at the more row they make, gesticulating, cackling, crowing, bickering like the big babies they are; the real youngsters dodging in and out of the crowd half-naked, or lying sprawling in the hot sun.

'The scene had its picturesque side, in the moving bright-hued currents of humanity, the women in dainty shades of muslin and scarlet turbans, the men more or less in rags perhaps, but rags fluttering white and vivid in the sunny picture. It was all vibration and sparkle; but, truth to tell, I was sick of the place, sick of the background of the sierras, the big-leaved bananas, the palms, the cane-pieces, the skimmed-milk sky. Sick, too, of the rum! Often the exotic sounds and scents and sights were painted out in my dreams, and a picture I carried always in my mind arose—a picture of far-away Scotland, a green wood, the voice of the Solway's tide creeping up the long sands haunting it, the hills behind it laced with mist. I wanted home badly, and swore that I would get there even if I had to touch the nadir of necessity, and ship as a stoker in a tramp-steamer! And if that isn't a certificate of a man being on his beam-ends, nothing is!

'I had just failed in one attempt. It was a sample of many. A Yankee steamer, Bristol bound, tempted me, and I managed to get an interview, fleeting but conclusive, with her skipper. "Any chance of a passage, sir?" I asked that "hard-case" officer. He took me all in, shifting a big Manilla cheroot from one corner of his clean-shaven mouth to the other. "W-a-a-l—yep, if yew've got the dust—sixty dollars!" I shook my head. He might as well have asked for the Koh-i-noor. "I've got to work my passage home," I said. "I'm on my uppers!" "Can y' steer?" he asked. "No," I replied; "but"—"Then quit," he said and turned on his heel, and I "quitted." He was a man of tidy speech, leaving no crumbs about, so to speak.

'However, I was young, and not easily cast down, and that very afternoon I got what I wanted. There was a schooner, *The Berwick Law*, berthed at a wharf just below old Ferajo's. Maximilian Napoleon Ferajo, in spite of his name, was a nigger who ran a store and a middling lodging-house, and what he didn't know of the ways of the Port could have been written on a postage-stamp. Wasn't above dopping the rum when a skipper was short-handed, so folks said. I was passing his shanty when the old rascal hailed me. "De cap'n ob de *Bellwick Law* just in, sah. Him wants buckra gen'l'man. Won't have no cullud gen'l'man. Him sailin' to-night, sah, for certain su-ah. You find him on bo-ahd. You get taken awn, sah, an' not forget old Max, sah!"

"I'm down to my last coin, but you'll have it if I sign on," I said, and straightway I hurried to *The Berwick Law*, a little schooner. There I found the captain, David Gerrand. He was a tall man, with a good, square, honest face; a Scot, but with the mighty frame, fair hair, and steel-blue eyes of a Viking. A pleasanter man than the average Scotch skipper, perhaps because he owned the schooner. I don't mean that the Scotch skipper is worse than his neighbour; but most of them have difficult rows to hoe. The old red ensign runs more to owner's profits than sentiment.

I told him my story. He listened, weighing me up.

"When I had finished, "Well, it's like this," he said, in a deep bass, after taking a fore-and-aft turn along the deck. "I'll no' deny that I'd rather have had an A.B.; but there's nothing to be had here but a couple of nigger skrimshankers, fed on mashed yams, that I wouldna have in a gift." He took a long stare at me.

"Um!—um!—ye havena the cut o' a pierhead jumper, an' ye're purpose-like an' willin', I make no doubt. Mind ye, I'm no' exactly short-handed. No. I can handle her fine wi' five o' a crew, countin' mysel', but I can be doin' wi' six. Ye look like yer day's darg. I'm gettin' ye cheap, I'll no deny, so if ye like to come I'll gi'e ye yer keep. I'm on the New-fun'land run wi' fruit, an' if ye do yer job I'll land ye in St John's wi' something in yer hand, an' a chance o' a passage hame at the hinder-end."

I closed with him at once, and became a foremast hand in the little wind-jammer, got together my few belongings, and that evening we had up anchor and slid out past the cluster of islets that front the island. The Port o' Spain light soon dimmed to a pin-point and disappeared when we sailed out of the Dragon's Mouth, and *The Berwick Law*, under a sky splendid with stars, spread her wings for the great Atlantic.

(To be continued.)

THREE PACIFIC ISLANDS.

THE early opening of the Panamá Canal has stirred the interest of three Governments in the fate of Palmyra, Washington, and Fanning Islands, north of the Equator. The Governments concerned are those of the United States, Great Britain, and Australia. Fanning Island is the connecting-link for the Pacific cable between Canada and Australasia, and makes possible the 'all-red route' for a cable system passing entirely through British territory. The Washington and Palmyra Islands are close to Fanning, and the group is estimated to be equidistant from Panamá and Sydney. Early in 1912 it was reported that Great Britain intended to establish a naval base at Washington Island, and to fortify Fanning Island. It was also reported that Britain was about to establish a coaling-station on Palmyra Island. This last report set the Government of the United States in motion. The facts alleged are that an American captain annexed the island in 1852, but prior to that it was in the kingdom of Hawaii. Britain annexed it in 1889, but United States authorities contend that that annexation did not cancel the prior Hawaiian title. At all events, in February 1912 the United States asserted her sovereignty, and sent a cruiser there to hoist the Stars and Stripes. It is considered probable that the matter will be settled by arbitration.

In themselves Washington and Palmyra Islands are of little value except for coaling or strategical purposes. It is somewhat different in respect to Fanning Island. There are elements of romance in its history. It has been in the hands of private families for close on fifty years. Fanning is wholly British territory. Forty-six

years ago William Greig, a British subject, settled on the island and procured a deed of conveyance from the British authorities. He exported to the American markets considerable quantities of copra and guano. Subsequently he took into partnership one George Bicknell, and the firm became known in the copra markets as Greig and Bicknell. William Greig died in San Francisco; and his executors, disagreeing over the management of the estate, went to arbitration, but without success. George Bicknell also died; but a son was discovered in Honolulu, the father's will allotting to this son a half-share in the island and in the business of Greig & Bicknell. A receiver was appointed to wind up the estate, and six years ago Fanning Island was put up to auction. During the Greig-Bicknell occupancy the island had been greatly improved. The cable company became tenants, and placed twenty thousand pounds' worth of plant and buildings on the island. The company also extended the wharfage and harbour facilities. A little uneasiness was created in Australia by the report that a German syndicate was making preparations to attend the sale. There was no fear that the island would pass from Britain; but the Pacific Cable Board has only a lease of the cable-station, and if the syndicate were the purchasers it was not clear what would happen when the lease ran out. However, the Fiji Government resumed the area on which the cable-station stands, and so dispelled apprehensions. When the auction took place at Suva, Father Emanuel Rougier, a reputedly wealthy South Sea Islands priest, was found to be the highest bidder. Later it transpired that he merely acted as agent for

Mr Humphrey Berkeley of Suva and Fiji. In 1911 Mr Berkeley sold Fanning Island, together with Washington Island, to the Fanning Island Company, Limited, with a capital of two hundred thousand pounds; and an attempt is to be made to develop the phosphate deposits and the production of copra.

It is not the business aspects, however, that command chief attention, but the political and strategic importance of the islands. The sentiment attaching to the 'all-red route' exercises special influence. In the beginning of March the Pacific Cable Board's steamer *Iris* reached Sydney, having completed the work of surveying the ocean-bed on the line of route on which the cable from Sydney to New Zealand will be laid. The sphere of the vessel's operations covers the eight thousand miles of cables connecting Australia and New Zealand with Norfolk Island, Suva, and Fanning Island. The cable from Sydney to New Zealand will be one thousand one hundred and sixty miles long. It will connect Sydney General Post-Office with Auckland General Post-Office, and will be part of the great system for linking up the whole of the British Empire. Fanning Island is already a coaling-station on a small scale, but is capable of important developments. It lies low, within a narrow ring of coral. It is twelve miles long and six broad, and is covered with cocoa-nut and pandanus trees. Best of all, in its centre is a large lake of fresh water. The island is more than self-supporting, and could be easily made a valuable depôt to a Power having interests in the South Seas. The three islands, Palmyra, Washington, and Fanning, with the small islets cropping up in the surrounding ocean, should really be under the flag of one Power. Two or more Powers dividing the properties between them are likely to pursue different schemes of development or to sublet to

traders with different ideas as to the proper treatment of Polynesian labourers. The group of islands, taken together, would pay for official management, but singly they will remain mere specks in the ocean, far from the eye of responsible authority, and possibly some time or another liable to become the prey of private rapacity.

Excavations on Fanning Island reveal that it was once inhabited by a skilled race. The digging away of guano has uncovered the remains of a large building nearly two hundred feet long and fifty broad. The corner-stones of the building weigh fully fifteen tons each, and the other stones are all very large. No mortar appears to have been used, the stones being mortised into one another. Mr Berkeley, when residing there, opened a tomb similarly uncovered, and found the skeleton of a human being. He also found a necklace made of the teeth of the cachalot and the skull of a dog. Professor Alexander Bingham, of the Bishop Museum at Honolulu, believes the skull to have belonged to what is known as the poi-eating dog. In ancient times the Hawaiians supported their high chiefs on dogs fed exclusively on vegetable matter, such as taro, which is still called poi. The conclusion arrived at from the study these objects have received up to the present is that Fanning Island was in olden times a resting-place of the Polynesians in their many migrations. It may be found that Palmyra and Washington Islands possess similar indications of the presence of inhabitants in remote antiquity. No systematic antiquarian or ethnological examination of any of the islands has been made.

From various points of view the future of the islands possesses so much interest that their fate excites an amount of attention altogether out of proportion with their appearance as small dots in the Pacific Ocean.

A CASE OF NERVES.

CHAPTER VI.

'Of course I shall go through with it, nurse, if only to prove that you are all wrong,' said Louie, as she lay humiliatingly prostrate in bed. Nurse Mary smiled cheerfully. 'That is the right spirit, Miss Holland. We must obey orders; but I hope you will not find us as bad as we look.'

But Louie knew that the nurse was merely bluffing, and she did not feel in the least possessed of the 'right spirit.'

As the 'treatment' proceeded—the wearisome days, the long nights, the incessant meals—the dire monotony incensed her to fury.

'If Charlie were a man,' she thought scornfully, 'he would have dragged me off within twenty-four hours! But of course he was glad enough to get off his bargain; sick of me and it, and

thankful to lay the blame on my shoulders.' Then she would weep surreptitiously into her pillow, keeping ears alert lest a nurse should come in and find her thus occupied.

How the first week passed Louie could never afterwards tell. Her whole frame was consumed with a horrible physical rebellion against the suddenly forced inaction, which spent itself in wild, restless tossing to and fro.

'If I don't want to sleep I won't sleep!' she argued to herself; yet she craved sleep as a derelict craves one drop of healing water. She seldom complained. If Sir Wallace had presented himself the storm would undoubtedly have burst; but the nurses were under orders, doing their duty, and she scorned the notion of obstructing them.

'You have put on the brake too quickly,' she remarked towards the end of the first week to Nurse Mary, who had come in to tell her mild stories and feebler gossip.

'Brakes are only put on when the going is downhill. The faster the pace the harder we are forced to press the handle.'

'Until the machine is on fire!'

'You are cooling already. You have slept for three hours this afternoon.'

This was the undeniable truth, and the burning in Louie's aching eyes was relieved. Yet the fact was nevertheless annoying.

So the treatment proceeded on its awful, even way. Tiny events magnified themselves. The sweeping of the passage outside became thrilling; when the blinds were drawn across in preparation for the necessary window-cleaning the excitement leaped beyond bounds.

The patient lost count of the days, and no nurse would set her right. When she asked the housemaid the date, it seemed that young person did not know.

How could Louie picture the village life or what her father would be doing when she did not know whether it was a court-day, a market-day, or a Sunday?

My miseries are so many and so huge
That each alone demands a life to wail—
Life in captivity, amongst inhuman foes!

So she quoted the immortal Samson to herself.

'Why don't I break out and go?' she groaned. Yet she did not break out, because in the dim world beyond the nursing home the problem of Charlie loomed. Here at least she was shielded from herself and Charlie.

Besides, the relief of an overpowering somnolence was possessing her. She found herself wrathfully and impotently trying to keep awake, and became frankly annoyed when she was roused for unnecessary food.

But at last a moment came when Nurse Mary proclaimed that Sir Wallace was so pleased with her progress that she was to go out for a drive.

'I shall die of excitement!' said the patient.

'That would be a mistake,' returned the nurse, 'because your father has been told to send down your horse next week.'

'I could ride to-day.'

'A half-hour's drive will fag you out.'

Louie positively snorted, yet the nurse was right, for on her return she welcomed bed as a friend.

Another week found Louie being pinned into her riding-skirt.

'It is perfectly outrageous!' she groaned. 'I am as fat as an advertisement!'

For a few days she was only allowed to walk, for a few more to trot in strictest moderation; but at last she found herself galloping in glorious freedom out on the wide sands.

Being on parole, she reported herself after an hour's such dissipation, and was ignominiously

returned to bed for the rest of the day, to sleep luxuriously.

At the end of two months her father came for her; and as they travelled up to London Louie declaimed vivaciously concerning her recent trials, yet she carefully refrained from mentioning either Charlie or the pageant. 'You are surely not going to that beast of a doctor, dad, until we have bought pistols?' she remarked.

'I am afraid we must,' he said deprecatingly.

'You sound as though we were both on ticket-of-leave!' And the squire rejoiced to see the old glancing fun in his daughter's eyes.

CHAPTER VII.

'YOU are well, Miss Holland!' So the doctor pronounced after his cross-examination.

'My clothes are too awful for words!' said the patient.

'Good for trade!' returned the doctor unsympathetically. 'You may now go out and shop; but beware how you visit my room again. You have but tasted my cup. If you appear a second time I shall force you to drink to the dregs.'

'Some of your dregs must have floated to the top, Sir Wallace,' laughed the patient as she fastened her gloves.

CHAPTER VIII.

'I WONDER if we need waste time in shopping!' asked her father as they returned to the hotel. 'If we catch the luncheon train we shall be in time for part of the rehearsal.'

'The pageant is going on?' she exclaimed.

'Certainly! They are all very keen. I believe the only detail wanting is Joan of Arc. Her horse and trappings await her arrival. I only hope she will be strong enough to wear her armour.'

'Small enough to get into it, you mean!' she retorted. 'But who has worked it all up? Who took my place?'

'They seem all to have worked together,' the squire answered vaguely.

'My head swims!' laughed Louie.

'Pray control it,' urged her father. 'I assure you, my dear, that I have no more medical guineas to spare.'

CHAPTER IX.

'I CAN'T believe that I am really out in the big world, free to do what I like,' said Louie as they were seated at luncheon in the express. 'I suppose the Suffragettes and the Passive Resisters and the criminals feel the same. I am sure I ought to say "May I?" and "Please" to every porter, and ask the waiter how much food I really ought to eat. But don't get uplifted, dad! I must rule somebody once more, and you are the only victim I possess.'

Again the squire felt himself in a difficulty, for

the obvious reference was to Charlie, yet it was too indirect to acknowledge.

But on reaching the village there was no doubt as to the pageant. A vast turmoil was apparent everywhere. Flags were flying, arches were erected, and as the carriage drove along Louie felt herself transported into a perfect nightmare of centuries. Quaintly dressed children cheered her as she passed; Men-at-arms, Cavaliers, Round-heads, Ancient Britons, Romans, thronged; and Boadicea herself greeted Louie from her chariot, while Hengist and Horsa dashed past in wildest hurry. Puritan Maidens walked serenely by Grand Inquisitors. Mary Queen of Scots and Queen Elizabeth passed in a governess-car, the one queen arranging the other's somewhat disordered headgear. All were going in one direction, to the pageant field, from whence gay music could already be heard.

Louie leaned forward with moist, sparkling eyes.

'You see, little girl, they didn't want to let anything through. I really think they have worked all the harder because you were driven off,' the squire explained, rather anxious at his daughter's silence.

'I understand,' said Louie unsteadily.

But now they had entered the park, and in another moment the young mistress was receiving an overwhelming welcome from the household. She reached her room and locked the door. Then she went to the window.

The park and the garden were undisturbed. There they lay as ever—supreme in their quiet possession of to-day and the centuries. So it seemed that every one had imagined that the one thing she wanted was a pageant. The dust and ashes of it all! And yet, how all these people must have slaved on her behalf! At least she must not show by her manner that she was drinking wormwood and gall.

Her maid knocked, and she opened her door.

CHAPTER X.

'WE were all so uncertain whether you would be here or not that people will be doubly pleased,' said the squire as, after a refreshing cup of tea, they drove off to the field.

'I feel a perfect fraud!' said Louie.

The squire turned and gazed at his daughter as though he could not sufficiently content his eyes. 'It is so wonderful to have you home again, little girl, looking—well, seventeen.'

'Fat, fair, and forty!' she retorted. 'Hallo! more warriors!' as a rider galloped towards them.

The carriage drew up with a jerk.

'Alfred the Great!' said the squire hastily.

'Charlie!' Louie exclaimed, startled into a smile of such sheer rapture that the Saxon King ventured close to the carriage and bowed low.

'King Alfred at your service, fair Joan of Arc!' he said, returning her gaze.

'You are an anachronism!' she retorted.

'And you—you are centuries too late!'

'Half-an-hour,' said the squire practically, looking at his watch. 'Has the thing begun?'

'Yes; they are doing the march past.—Drive on, Morris, and I will act outrider.'

'A king can't serve a common peasant girl,' said Louie softly.

'Yet a peasant girl can save a king,' he returned.

'But I thought Charlie was in Scotland?' said Louie to her father as the carriage drove on.

'He did not fancy Scotland. He put in two months' grind at the pageant instead.'

'I see,' said Louie soberly.

'He is staying down in the village now that you have come home.'

'But why?' asked Louie.

'I really hardly know,' he answered. 'I am sure he would be more comfortable at the Hall.'

'Much more comfortable,' said Louie emphatically.

CHAPTER XI.

FATHER and daughter dined alone, and talked over the rehearsal enthusiastically. It was all more comical, more brilliant, more wonderful than Louie could ever have dreamed.

'I really think I must go up and see if I can turn myself into Joan of Arc. I feel so horribly everydayish in this frock!' she said with all her old energy.

'The sooner they know whether you can take the part the better of course,' said the squire.

'Then wait for coffee till I come down,' she ordered.

'I didn't know that Joan of Arc ever drank coffee,' said the squire. It was amazing to note the boyish interest he was now taking in the whole affair.

But Louie escaped with a laugh; and, by dint of much excited assistance from devoted maids, Miss Holland at last discovered herself as a fully armed soldier, clanking down the wide, polished stairs.

The sensation was curious, and as she was pausing to realise herself as the Fair Maid of France, before exhibiting her glories to her father, the hall-door opened, and King Alfred entered.

Joan coloured charmingly, and to cover her confusion exclaimed, 'The anachronism again!'

'My princess!' and he came forward and bent his knee.

'Don't be silly, Charlie!' she exclaimed. 'Attention! Do I look all right?' and she struck a pose before him.

He came closer, so close indeed that he captured her left hand. 'There is something wrong here. Where is your ring?'

'Oh, I can't wear it, really!'

'But why?'

For one instant she gloated over the strained

gravity of his look; then she rescued him radiantly. 'I have grown too fat. It hurts. Does it matter?'

A great relief swept across his face. 'Lou, you are incorrigible! Do come somewhere; I want to explain what a brute'—

'I'll come somewhere, but I hate explanations. Why mayn't we cry quits?'

'I'll cry anything you like so long as you take off that helmet.'

'Oh, and we had such a bother in getting it right!' she objected.

'But I can't see your hair.'

'Poor dad is waiting for his coffee. He declares that Joan of Arc never drank coffee, but she is perishing for a cup.'

'She must not perish!' said the king, as he took the young soldier's arm and led her triumphantly into the drawing-room.

THE END.

MECCA AS A TURKISH ASSET.

By A. J. PARK CRAWFORD.

TO the mind of 'the man in the street,' Mecca presents itself as merely some far-distant, desert city which is held in veneration by Mohammedans, and to which they turn when praying. So far as it goes, the ordinary estimate is correct, but the earnest student of Eastern affairs realises that Mohammed's city is more than this. The journeying thousands who conscientiously make their pilgrimage to Mecca account it such a Holy of Holies as to make death there a desirable thing. From Java, India, Morocco, they come, their colours ranging from a light shade of white to the darkest ebony; but their racial differences are sunk and put out of mind by their common object. One cannot help but admire the faith that inspires each of its devotees to sacrifice time, money, and other considerations in such a manner. It is the strength and wide extension of this faith that constitutes such a strong element in Turkey's favour as a country, for the Sublime Porte and Islam are one to the Moslem. Woe to the Nasrani, the unbeliever, who is found attempting to force the secrets of the Holy City! And if such meet with a sudden end, how much more would the wrath of the faithful be raised if the desecrating hand of a Western nation were laid on the Hedjâz! Not only this. However ready Turkey may have been to dethrone her late sovereign, when the foreigner brings the strong hand to bear and wrests her territory away, other Moslem nations remember that the Sultan is Mohammed's representative on earth, and the guardian of the venerated sacred places of the Prophet's birth, miraculous flight, and death.

The Jihad, or Holy War, is not, in a way, so much a thing of the past as might be supposed; but it is not likely, judging even from the most recent events in the uncertain East, that, as in the past, the Jihad will start from the meteoric rise of a self-proclaimed prophet setting fire to his inflammable neighbours. The march of civilisation has been such that day by day the wild frenzy and mad lust for self-immolation on the weapons of the enemy is becoming more and more a thing of the past. Such isolated pictures of wild happenings as are conjured up for the credulous newspaper public by graphically

descriptive visitors to Kairwan and other centres where exist dervishes kept for the purpose of giving exhibitions are rarely due so much to religious enthusiasm as to a desire for backsheesh. The eating of broken glass, stabbing, munching of thorny cactus till the blood pours—these are isolated instances only of madness, coldly calculated often beforehand by the chief for the money brought, which are engendered by religious mania or fanaticism by a class peculiarly liable to be thus affected. Such affairs are not at all symptomatic of the possibility of working up the general mass of the people to a frenzied rancour.

Where the religious element, however, enters the field of practical politics in such a case as the possible seizure by a foreign Power of a place sacred to Moslem tradition; but many smaller instances might be quoted. As has been clearly shown in the recent Tripolitan conflict, the religious susceptibilities of Moslems have been aroused by the mere fact of the aggressive nation being of another faith, little regard being really attached to the rights and wrongs of the matter. Complaints have been raised in India and Egypt, the latter especially, and have been in nearly all cases presented to the British throne and Government. The attitude is typically Eastern; objection is taken against war being raised by a Christian against an Islamic people principally because of the faith of the former, and complaint is made to another nation of the objectionable faith in order to persuade it to take up the cudgels for the assaulted one. Especially in Egypt is this attitude so peculiar, though at first sight wholly flattering to our *amour propre*. There the British régime is subject to systematic insult from the native press, and there exists an actively intolerant spirit directed against Christian effort. The appeal is always to Moslems in these papers; and the protection of their faith, as embodied in the person of the Sultan, is the ostensible object of the agitation against the administrative nation. The sudden recognition of our virtues and place as the real guardians of the faith of millions of Mohammedan subjects, coming as it does at a time coincident with a desire to make use of Great Britain as a peacemaker, is rather lowering

to one's idea of the Egyptian Nationalists. The significant fact, however, is that they do all they can to further the interests of Turkey—which has always treated Egypt harshly, and the memory of whose exactions still rankles—because Turkey represents the head and fountain of Islamic power on earth. Mecca symbolises Islam,

and Turkey's power is very evident in relation to it. The multitude who gather at the pilgrimage see and acknowledge the power, and in many cases, as these pilgrims are naturally the most devout of their fellow-countrymen, would esteem it glory to die in aid of the Power which holds and defends their holy places were the latter assaulted.

THE DERELICT.

By WALTER WOOD.

'WHAT'S that queer lump ahead of us?'

The captain, who was on the bridge, to which he had been called by the chief officer, asked the question.

'A derelict,' the chief replied. 'If it isn't that, it's an enormous whale.'

The captain looked again through his glasses, and gazed long and searchingly at the mysterious object. 'I think you're wrong, either way,' he observed. 'It isn't a whale—I never saw one as big; and it isn't a derelict—I never saw one like that. We're in no great hurry, and shall pass the thing very close. It's an ugly brute, whatever it is, and a proper puzzle.'

The *Western Ocean* was passing close to the object, which lay just awash, as it seemed, in mid-Atlantic, and no alteration of her course was necessary. The captain again looked searchingly through the glasses, and saw only what he had observed with the naked eye—a long, low, stripped hull, which showed no sign of life or movement. The only thing which was clear was that this was no ordinary vessel, no waterlogged timber-ship, no crippled tramp which had managed to keep afloat, no sailing craft of any kind which had been abandoned by her crew.

'It isn't a whale,' the chief announced decidedly, 'and it isn't any known Atlantic craft. It may be some experimental freak which has come to grief, but I doubt even that. The truth is, things change so swiftly at sea that you hardly know where you are from one day to another. I should say now, when we're nearer, that she's an abandoned dredger turned turtle, or a floating-dock half-capsized. What do you think, sir?'

'I give it up,' replied the captain; 'but she's neither of those things.' He descended the bridge and went to the Marconi office. The operator was in the doorway looking at the derelict.

'Can she communicate in any way with ship or shore?' inquired the captain.

'No, sir.' The operator spoke very definitely. 'She's as harmless as a canal barge.'

'That can be bad enough, if it's in the way,' observed the captain.

He returned to the bridge. 'I shall send a boat's crew and have her looked at; and I hope that very soon she'll be blown up,' he said. 'The derelict's a danger to navigation.'

He gave his orders, and while the *Western Ocean* was gently rolling on the swell he watched the lowering and getting away of a boat.

'The old man's mad,' murmured the chief; and the second officer, to whom he spoke, agreed that two hundred runs across the Atlantic were too much for the brain of any man.

'What is the brute?' asked the chief. 'I never saw or heard or read about anything like it. I suppose Crooks can tell us when he comes back.'

Crooks was the fourth officer, and he was now on his way to the strange object. The boat got very near, and Crooks was seen to stand up in the stern-sheets and hail. There seemed to be no answer, for no sign of man or beast was visible on the craft.

'It's just a derelict, some freak ship turned turtle,' observed the chief. 'I can make the shape out pretty well now, and it seems to me just the common or garden shape of an iron ship. I should judge her to be about a thousand tons. It's a pity she's there, just in the track of the big liners. I hope some warship will come along and blow her to smithereens. Let's hear what Crooks has to say.' He leaned over the end of the bridge and listened to the junior's account of his examination.

'Iron ship, bottom up, as far as I can make out,' reported Crooks. 'I didn't try to board her; there was nothing for even a monkey to hold on to. It's the oddest, weirdest floating thing I ever saw. Gives you the creeps to look at her, especially when you imagine what she's got bottled up inside.'

The captain gave a last long look at the object; then he ordered the *Western Ocean* to proceed. The occurrence was duly logged, and it was expected that in time some wandering warship would find a useful target in the derelict.

The *Leviathan* had got clear of Queenstown, where she had taken the mails on board, and smoke streamed straight aft from her quartette of gigantic funnels as she headed across the Atlantic, New York bound. It was the end of the tourist season, and she was carrying a record number of passengers. There was not a vacant berth in the ship. Besides that, the *Leviathan* was conveying more wealth than had previously

been carried by any liner afloat. There was a shortage of gold in New York, and she was taking out a supply to fill the gap. Some writers put the amount as high as five millions sterling.

When the *Leviathan* left Liverpool there were rumours of serious trouble with a great foreign Power; but there had been many scares of the same description, and in the smoking-rooms the matter was discussed as one of secondary importance. The great problem was, would the *Leviathan* beat her own record, which already gave to her the blue ribbon of the Atlantic? The weather was perfect, the ship was in admirable trim, and it was declared that neither life nor coal would be spared below to improve on previous runs. The ship's newspaper published a statement of the first twenty-four hours' steaming, which showed that the *Leviathan* had eclipsed her own achievements. For three days she added to her reputation, and the records were duly published, and gave a basis for calculation to the gamblers.

Then at breakfast on the fourth day there were some very serious faces and lessened appetites, for the *Bulletin*, the ship's newspaper, announced by wireless that matters between the two nations had reached a most sinister stage. In the same issue was a small paragraph stating that the steamship *Western Ocean*, on reaching New York, had reported a derelict directly in the track of liners, and that commanders were advised to keep a specially sharp lookout for the floating danger.

'That is the sort of paragraph which would be better unpublished, I think,' said a passenger who occupied the seat on the captain's right at the captain's table. He spoke in a low voice.

In subdued tones the captain answered, 'You're right, admiral. It was a bit of a mistake to give it. I believe the editing is being done by an amateur author who is on board. It's always a pity when a trade is attempted by some one who hasn't served a proper apprenticeship.'

'May I come and see you in the chart-room?' asked the admiral, still in a low voice.

'I'm going there now,' the commander answered, 'and I shall be glad to see you.' He rose and left the table. A few minutes later the admiral, quietly and unobserved, followed him.

He found the captain poring over a chart. 'We should be within fifty miles of the derelict now,' observed the captain. 'Going as we're going now, we shall almost run into it. I'm glad the weather's so clear.'

'Yes,' agreed the admiral. 'Fog is too big a risk even for a record-making passage. Shall I tell you what I think?'

'Please go ahead, sir.'

The admiral bent and whispered, 'I have a theory about this derelict, and that is that she isn't a derelict at all. If I'm right, her shape

is very much like this.' He drew a rough plan on a sheet of notepaper.

'Why,' exclaimed the captain, 'that would make her a sort of submarine monster!'

'Which is exactly what I mean,' said the admiral.

'And why in the world should she be skulking in the Atlantic steam-lanes?'

The admiral whispered again, and the captain's ruddy face blanched a little. He sighed, for he recollected that he had in his keeping and absolute power two thousand human lives, a ship and cargo, and specie representing a colossal fortune.

'Big as you are,' added the admiral, 'you could be destroyed in the twinkling of an eye if what I suspect is true.'

'It isn't true! It's too diabolical!' declared the captain.

'War is war,' replied the admiral.

'There is no war,' asserted the captain.

'My friend, let us go to the wireless-room and learn the latest.'

'I will go,' said the captain, 'but I feel almost like a weak fool in promising. Will you come with me, and leave all the questioning to be done by me?'

'I am merely a privileged passenger,' replied the admiral.

They went to the Marconi-room, and found that the operator was taking a message. He was so absorbed in his work that he scarcely noticed the visitors. He was writing on the top sheet of a pad of paper. One slip he scribbled on, then ripped it from the pad and crumpled it up and threw it upon the floor. He wrote on a second sheet, and dealt with that in the same way. His writing was hurried and ill-formed, and he seemed intensely excited.

'Well, what is the message that's giving you so much trouble?' said the captain when the third slip was allowed to remain.

'There it is, sir,' replied the operator. 'I hope and think I've got it right; but I can hardly believe my senses.'

The captain took up the slip and read the writing aloud, but in an awed, subdued voice, 'War is declared!'

'That's it, sir,' observed the operator, nodding his head. 'That's what the wireless has to say.'

'There's no mistake in the message?' asked the captain.

'Absolutely none, sir.'

The admiral did not ask which countries were concerned. He knew. Without uttering another word—for he was a man sparing of speech—he left the operating-room with the captain and led the way to his own cabin.

'You have five million pounds on board in gold?' he said. 'Come, captain, please do not hesitate. The time for keeping such a thing secret is past, if indeed it existed, for the fact was published broadcast when you left Liverpool.'

'You are right,' admitted the captain.

'And war is declared?'

'Yes; I heard what the operator said.'

'And, all told, you have two thousand souls on board?'

The captain nodded.

'The ship and her cargo are worth three millions, apart from the gold?'

The captain nodded again.

'So that, altogether, we have eight millions at stake? I say we, because I am concerning myself in this adventure.'

'In round figures, sir, that is about the sum.'

'And you know by this time what the derelict is!'

'I can only guess. I am not a naval man.'

'Well then, captain, I will tell you. She is the very last word in submarines—an enormous brute that has the power both to torpedo and bombard. She can destroy us with a shot.'

'The *Leviathan* will float even if she is cut in two,' declared the captain. 'That's the builders' theory, anyway.'

'The builders wouldn't care to be afloat in either half,' observed the admiral. 'But let us go on deck—dare I ask you to allow me to join you on the bridge?'

The captain nodded, and they went on to the bridge. Almost before the lookout had shouted 'Something nearly dead ahead!' the admiral had seen the derelict and pointed it out to the captain. The strange object was then about two miles away.

'She's been built and launched and sent to sea by stealth,' said the admiral. 'The people who can keep a secret like that can keep their mouths shut as to how the *Leviathan* vanished; for, my friend, if we refuse to surrender we shall be destroyed.'

'I'm not going to surrender, admiral. I'm going to see what the *Leviathan* can do by way of showing a clean pair of heels.'

'Oh yes, you are going to surrender,' observed the admiral quietly.

'I'm the captain of this ship, sir; and, big as she is, she hasn't room for two.' The captain spoke warmly.

The admiral answered quietly, 'Captain, that is well spoken, and worthy of you; but the time has come to make a pretence of caving in, anyway. You cannot be a party to the sacrificing of two thousand innocent souls. These passengers do not even suspect that anything is wrong, and there are a thousand women and children amongst them.'

The captain was silent.

'I hope you will at least stop the ship,' said the admiral.

'I shall continue full speed ahead, sir,' was the firm reply. 'I shall treat the foul thing as if it didn't exist.'

The *Leviathan* was rushing past the hostile craft at thirty knots, when a loud report was

heard and a shot whizzed across her bows, another screamed over her bridge, and a third almost touched her stern.

'That is most excellent practice,' observed the admiral, 'and is meant to show that we are absolutely at her mercy. She has come fully to the surface, and has a splendid gun-platform. She can riddle us like a sieve in less than a minute. I suggest again that you should stop.'

The captain muttered savagely, gave an almost despairing look at the sinister creation near them, and wrenched the handle of the engine-room telegraph to 'Stop.'

While the *Leviathan* was still under way a swift launch left the mysterious monster and dashed over the waves towards her.

'What's the way out of it?' asked the captain grimly.

'We can tell better when this good person has come on board,' replied the admiral. 'They are sending to demand your surrender. Look at that naval officer in the launch.'

'I'll shoot him like a dog of a traitor,' said the captain savagely.

'War is war,' replied the admiral, 'and victory goes to the strongest hand. They have us in their grip. Do the affable, and let me help you.'

The captain and the admiral were standing by the starboard-bridge ladder when the naval officer from the launch boarded the *Leviathan*. He joined the two men, and ceremoniously, with many regrets, and in excellent English, demanded the surrender of the ship.

'We're not at war with any country,' explained the captain.

'Oh yes, with mine, sir.' The visitor spoke placidly.

'Declared by yourselves, before the outbreak of hostilities,' said the admiral.

'You are Sir Bernard Hollister?' The officer spoke very politely still; and, without waiting for an answer, he continued, 'We had knowledge that you were on board. You have my profound sympathy, and I give it to all. This is the fortune of war.'

'You ask for the ship?' said the captain.

'Yes, and her gold,' replied the visitor.

'You can get off my bridge and into your launch and back to your slinking derelict,' exclaimed the captain, 'and I will give you two minutes before helping you down the ladder.'

'I will give you, sir, two hours to make up your mind,' replied the visitor, undisturbed. 'I will return to my ship and wait for your answer. —Perhaps, Sir Bernard, you can explain to the captain how hopeless is his chance of escaping.'

He saluted the captain, then the admiral, and retired, still placidly and politely, to his launch and returned to his own craft.

'It will be pitch-dark in two hours, captain,' said the admiral, 'and with luck we shall be on our way to New York again. Will you leave the salvation of the *Leviathan* with me?'

'Whatever there is to do in the way of saving her, sir, must be in my hands; but I'm not such a dog in the manger as to stand in the way of any performance that means salvation. My duty is to get the ship to New York, and I want to do it.'

'You have Mr Dallas amongst your passengers?'

'He's there in the crowd, watching the foreigner.'

'I want you to ask him into your cabin, so that the three of us can hold a council of war.'

'Very well, sir, I'll invite him.' The captain turned to the quartermaster: 'Go and ask Mr Dallas to come into my cabin at once.'

The quartermaster took the order, and Dallas joined the captain and the admiral.

'Now, Mr Dallas,' said the admiral, 'I know that you are on your way to America with a warplane to be tested by the authorities on the other side. Could you rise from the deck here? It's big enough and broad enough.'

'I can rise from anything, sir,' said Dallas.

'We have been given two hours in which to determine whether we will surrender or be sunk. War has been declared between our own country and that of our friends the submersible. I want to ask if you will do this.' The admiral lowered his voice, and the listener's face blanched as he heard the scheme.

'I will be your passenger,' said the admiral.

'I will not shrink from doing what I urge on other people.'

'I'll rise,' announced Dallas firmly, 'as soon as you like.'

'That will be just after darkness,' said the admiral. 'By that time your warplane will have been got on deck and put together.'

The submersible was showing one or two lights only as she rested on the placid waves; and the *Leviathan* was displaying a very small number of her own.

'They are making ready for the surrender,' observed the captain of the submersible; 'and I am glad. It would have been horrible to destroy her, and we shall find the gold so useful. I think we shall have her captured without trouble. Ah, what is that? It is something in the air! I saw a shadowy form. Can it be a—'

He did not finish his sentence, for his companion had drawn his revolver and shot at random into the dark air. Another bullet followed, then a little fusillade as the men of the submersible turned out in obedience to orders.

For a moment only the rattle of firearms was heard; then there was an appalling report, and a terrific flash illumined the darkness.

From the warplane aloft the admiral had dropped a bomb, then another.

'It is their doing,' he observed grimly. 'They brought it on themselves. And all is fair in such a war as this. Let them have a third.'

He dropped a final bomb on the stricken

vessel; then a thunderous report and lurid burst of flame were followed by oppressive silence.

'She's vanished,' said the admiral. 'And the depth of the Atlantic hereabouts must be fully five miles. Yet I feel callously indifferent. As for you, wealth and fame are in the hollow of your hand. The gods themselves could not have given you a better chance of proving the deadliness of your inventions.'

'I guess they've been more than kind,' said Dallas. 'I wouldn't change my place with any man that wears a crown.'

'We can venture back to the *Leviathan*,' said the admiral.

The warplane descended to the wide deck-space, and Dallas and the admiral, flushed with triumph, rejoined the captain. He also felt the exultation of victory.

'Gone, sir?' asked the captain, addressing the admiral. He was an unemotional navigator, but he took an arm of each companion and steered them to the chart-room, at the same time commanding the steward to bring a bottle of champagne.

'The thing is now being crushed by the water,' said the admiral. 'She's completely gone.'

'We'll follow suit,' said the captain. 'Full speed ahead,' he cried, and waited till he heard the faint clang of the gong below. It was followed by delirious cheers from the passengers, who were crowding the vast decks.

'There's one thing I shall have to ask you, Mr Dallas,' said the captain when the glasses were clinking for the second time. 'Those awful bombs were smuggled on board?'

'They were,' admitted Dallas.

'Then will you throw the rest overboard? I know you will, so you needn't hesitate. It's strictly against the regulations to carry them in this ship, and we've got back to the stage when regulations have to be obeyed; although I'll break one of them and give the admiral and you the run of the bridge till we reach Sandy Hook. I can't pay any man a greater compliment than that.'

THE MIRAGE.

As one who, raptured, silent stands
With lifted heart and outstretched hands,
The while he views, 'gainst golden skies,
That witching, fair illusion rise—
The mirage 'mid the desert sands;

So we, held fast in earth's grim bond,
Reach forth fain hands in fancy fond
Where, far upon the desert waste,
The lovely waving palm-tree's traced,
And mirage cheats our hearts beyond.

Yet when, at last, the long, low light
Falls but on sand, and, wan and white,
Life's vain and vapoury mists uproll,
Then, Heaven before the seeking soul,
Earth's mirage vanishes from sight.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

TIME is speeding faster now than in the days when the world moved on in an easy, comfortable kind of way, with fewer sensations, fewer shocks, and rarely a new invention that overturned existing systems. It is difficult to realise that it is eighty years since Queen Victoria was a girl, and big enough and with such keen intelligence as to keep a very thoughtful diary. It was only as yesterday that she was Queen, part of the nation, emblem of the soul of the people. She hardly seems to have gone away. But children have been born since her departure who are getting on towards the end of their schooldays now, and it is positively eighty years since the little Princess who became the mightiest of monarchs began to write down in her private book a record of her thoughts and feelings. And what a distance we are now from the ease and happiness and sweet simplicity of life in those times! Eighty years indeed! If it seems difficult to realise that so much time has gone since little Victoria was being trained for her queenship, yet there have been centuries of achievement done in it. However, we can go back to the Victorian atmosphere—and it makes a delightful change in these rushing, war-ridden times—most realistically in the reading of the extracts from the private diary of the Queen from 1832 to 1840, which, edited by Lord Esher, have just been published by John Murray in a sumptuous form. The work is one of the most interesting of its kind that has ever been produced, and it makes a most admirable supplement to the letters of the Queen that were published a few years back. The sense of intimacy, confidence, is of course better in the diary than in the letters. And little Victoria was a most admirable diarist, with a scrupulous regard for exactness of detail in all her statements. She always recorded most precisely the time when things happened with which she was concerned. No aeroplanes, no motor-cars, few railway trains in the days when Victoria began to keep a diary. The very beginning of her diary brings this fact before us, for the first entry was made on 1st August 1832, the Princess being then in her fourteenth year, and on that day setting out on a long journey northward by the road with carriage and horses. So she says: 'We left K. P. [Kensing-

ton Palace] at six minutes past seven, and went through the Laverfield-gate to the right. We went on, and turned to the left by the new road to Regent's Park. The road and scenery is beautiful. Twenty minutes to nine—We have just changed horses at Barnet, a very pretty little town. Five minutes past half-past nine—We have just changed horses at St Albans. The situation is very pretty, and there is a beautiful old abbey there.' Then she goes on to tell us further of the progress of the journey: how Meridon was reached at half-past five, and the night spent there at 'a very clean inn,' the journey being resumed next morning at six minutes to half-past seven; and she gives a picture of the 'black country' in these words: 'I just now see an extraordinary building flaming with fire. The country continues black, engines flaming, coals in abundance everywhere, smoking and burning coal-heaps, intermingled with wretched huts and carts and little ragged children.' The little Princess was a good observer.

* * *

At a ball given in honour of her seventeenth birthday she saw for the first time the two Princes who were put forward as candidates for her hand, Prince Albert of Saxe-Coburg and Prince Ernest of Orange. She knew at the time what ideas were entertained regarding them, and was naturally critical. All her impressions were in favour of Prince Albert, the other not attracting her at all. She wrote in her book: 'Albert, who is just as tall as Ernest, but stouter, is extremely handsome; his hair is about the same colour as mine, his eyes are large and blue, and he has a beautiful nose and very sweet mouth, with fine teeth; but the charm of his countenance is his expression, which is most delightful, *c'est à la fois* full of goodness and sweetness, and very clever and intelligent.' She tells us through the diary something about her tastes and fancies as a little girl. She was very serious-minded, and had hardly the patience for any reading of novels. 'Read *Eugene Aram* for some time,' she wrote, 'while my hair was doing, and finished it; beautifully written and fearfully interesting as it is, I am glad I have finished it, for I never feel quite at ease or at home when I am reading a novel, and therefore was really glad to go on to

No. 100.—VOL. III.

DECEMBER 28, 1912.

Guizot's *Révolution de l'Angleterre*.' On the day of her accession to the throne she wrote: 'Since it has pleased Providence to place me in this station, I shall do my utmost to fulfil my duty towards my country. I am very young, and perhaps in many, though not in all, things inexperienced; but I am sure that very few have more real goodwill and more real desire to do what is fit and right than I have. . . . At nine came Lord Melbourne, whom I saw in my room, and, of course, quite alone, as I shall always do with my Ministers. He kissed my hand, and then I acquainted him that it had long been my intention to retain him and the present Ministry at the head of affairs, and that it could not be in better hands than his.' As she grew up her tastes became more and more decided. She went to Drury Lane once to see *Richard III.*, with Charles Kean in it, and wrote afterwards: 'It was Shakespeare's tragedy of *Richard III.*, and Charles Kean's first appearance (in London) as Richard. It would be impossible for me to attempt to describe the *admirable* manner in which Kean delineated the ferocious and fiend-like Richard. It was quite a *triumph*, and the latter part particularly so. . . . All the other parts were very badly acted, and the three women were *quite detestable*. I but just escaped being recognised, for as the curtain was dropping and I left the box they called out, "The Queen!"' Sigismund Thalberg, who was at the top of his fame just then, enchanted her: 'After dinner, at ten o'clock, came Thalberg, the most famous pianist in the world. He played four things, all by heart. . . . *Never, never*, did I hear anything like him! He combines the most *exquisite, delicate*, and touching feeling with the most wonderful and powerful execution.'

* * *

We have as never before the story of the feelings and fancies of the monarch on the Coronation day: 'I was awake at four o'clock by the guns in the Park, and could not get much sleep afterwards on account of the noise of the people, bands, &c. Got up at seven, feeling strong and well; the Park presented a curious spectacle, crowds of people up to Constitution Hill, soldiers, bands, &c. . . . At ten I got into the state coach with the Duchess of Sutherland and Lord Albemarle, and we began our progress. It was a fine day, and the crowds of people exceeded what I have ever seen; many as there were on the day I went to the City, it was nothing—nothing to the multitudes, the millions of my loyal subjects, who were assembled in every spot to witness the procession. Their good humour and excessive loyalty was beyond everything, and I really cannot say how proud I feel to be the Queen of such a nation. I was alarmed at times for fear that the people would be crushed and squeezed on account of the tremendous rush and pressure. I reached the Abbey amid deafen-

ing cheers at a little after half-past eleven. . . . Then followed all the various things, and last (of those things) the Crown being placed on my head, which was, I must own, a most beautiful and impressive moment.' She was deeply impressed with the ceremony, but it was done somewhat awkwardly. 'The Archbishop had put the ring on the wrong finger, and the consequence was that I had the greatest difficulty to take it off again—which at last I did with great pain.' After descending from the Throne the Queen proceeded to St Edward's Chapel, where Lord Melbourne observed that what was called the altar was covered with sandwiches and bottles of wine. The Archbishop came in, and ought to have delivered the Orb, but the Queen had already got it. She said that the Crown hurt her a good deal; but for all the little mishaps, she set it down that the day was 'the proudest of my life.'

* * *

But the best and most entertaining part of the diary of these eight years of wonder and greatness, and the glorious expansion of this queenly flower, is the love-story as it is related by the heroine of it. The prologue to it has already been cited. After her marriage the real story soon began, and it was much more human, far less merely business-like and prosaic, than it once promised to be. She writes about it in her secret book like a timid, blushing, but warm-hearted girl. Lord Melbourne soon began to prepare her for the idea that marriage, and an early one, was a necessity in her case. As Lord Esher says, no one but Lord Melbourne could have said to her in homely language, 'You will be very much more comfortable, for a woman cannot stand alone for any time, in whatever position she may be.' Then, after discussing some other affairs of State with her on one occasion, he changed the subject with 'And now, ma'am, for this other matter,' meaning the matter of the marriage that was to be. But at this stage, having seen little or nothing of Prince Albert since her seventeenth birthday, she was thinking of the matter in the abstract, and did not altogether like it. She had a conversation with Melbourne of which she tells us this: 'Talked of my cousins Ernest and Albert coming over—my having no great wish to see Albert, as the whole subject was an odious one, and one which I hated to decide about; there was no engagement between us, I said, but that the young man was aware that there was the possibility of such a union. . . . I said I wished if possible never to marry. "I don't know about that," he replied.' But in October of that year (1839) the Prince came over, and he very soon made a considerable change in the queenly mind. On the 11th of the month, after one entrancing evening, she wrote in her book: 'Albert is really quite charming, and so excessively handsome, such

beautiful blue eyes, and exquisite nose, and such a pretty mouth with delicate moustachios and slight, but very slight, whiskers; a beautiful figure, broad in the shoulders and a fine waist. My heart is quite going. At about half-past ten dancing began. I danced five quadrilles: (1) with Ernest; (2) with dearest Albert, who dances so beautifully; (3) with Lord Alfred; (4) with Ernest; and (5) with dearest Albert again. There were no epithets for Ernest; and while the young Queen in this diary is lavish with the use of the 'dear,' she reserves for her future Consort exclusively the superlative.

* * *

Two days afterwards she informed Melbourne that she had quite made up her mind to marry Albert, and on the day after that the Prince came along for the interview which was to make the betrothal. The offer, of course, had to come from the Queen, and she performed a difficult task with skill and delicacy. 'After a few minutes I said to him that I thought he must be aware why I wished him to come here, and that it would make me too happy if he would consent to what I wished (to marry me). We embraced each other, and he was so kind, so affectionate. I told him I was quite unworthy of him. He said he would be very happy—*das Leben mit dir zu bringen*—and was so kind, and seemed so happy that I really felt it was the happiest, brightest moment in my life, which made up for all that I had suffered and endured. I told him it was a great sacrifice, which he wouldn't allow; I then told him of the necessity of keeping it a secret, except to his father, and Uncle Leopold and Stockmar, to whom he said he would send a courier next day; and also that it was to be as early as the beginning of February. I then told him to fetch Ernest, which he did, and he congratulated us both, and seemed very happy. I feel the happiest of human beings.' Then it was sunshine and roses all the time. The girl is in rhapsodies about the charms and excellence of her future husband. 'I sat on the sofa with dearest Albert. . . . I played two games at tactics with dear Albert, and two at fox and geese. Stayed up till 20 m. p. 11. A delightful evening.' Joy! And then in due season came the great wedding, and the Queen tells her own story of it. 'The ceremony,' she tells us, 'was very imposing, and fine and simple, and I think ought to make an everlasting impression on every one who promises at the altar to keep what he or she promises. Dearest Albert repeated everything very distinctly. I felt so happy when the ring was put on, and by Albert. As soon as the service was over the procession returned as it

came, with the exception that my beloved Albert led me out. The applause was very great in the Colour Court as we came through.' There was a great gathering of notabilities at Buckingham Palace after the ceremony, and Melbourne was the last person with whom the Queen had conversation before she departed. She says: 'I pressed his hand once more; and he said "God bless you, ma'am," most kindly. Dearest Albert came up and fetched me downstairs, where we took leave of mamma, and drove off at near 4.' And the last words in the diary are: 'I and Albert are alone.'

* * *

Lord Esher gives us to understand that this is the last that we shall have presented to us in the way of letters and diaries of the great Queen. All the others will remain for ever secret. In his preface to the work he discloses an interesting fact regarding King George's views on the present troublesome Buckingham Palace question, to which reference was made in these pages a little while since. There are differences of opinion about it; but there is something like a fairly general feeling that in appearance the Palace is not at all what it should be, and that it fits in badly with the western end of the Mall, which it closes up. It has been decided to put a new front of Portland stone to it, but some architectural experts feel that the best thing would be to pull it down and build it all over again. It appears that King George would like to see it ended, for Lord Esher writes: 'King George's dream, and no one knows better its visionary character, is to pull down Buckingham Palace, to round off St James's and the Green Parks at Constitution Hill and Buckingham Gate, and then, with the money obtained by the sale of the gardens of Buckingham Palace, to reconstruct Kensington Palace as the town residence of the sovereign. For Queen Mary the place is full of memories, and, because of her keen historic sense, full of interest. Compared with most of the great European capitals, London is poor in palaces. The homes of the Tudor sovereigns in and near the Metropolis—Nonsuch, Greenwich, and Whitehall—have disappeared. London contains no single palace residentially associated with our long line of sovereigns. The Court of St James was housed in the eighteenth century in the palace of that name. It seems to have been adequate for the needs of the Hanoverian princes, who had none of the amplitude of the Tudors or the fine taste of the Stewarts.' But it is very certain that Kensington Palace will never take the place of the other as the kingly residence.

THE SHIP OF SHADOWS.

CHAPTER VII.—THE SHIP'S COMPANY.

'I'LL muster the ship's crew. Where are they all now?

'We were half-a-dozen all told, not counting the skipper's wife, who, I learned, was on board, but too ill for some days to come on deck. She was newly married—on her honeymoon. When she did appear— Well, I'll come to that.

'The captain, David Gerrand—the "Old Man" in sailor parlance—I've told you about. The mate, Hulse by name, was a Londoner, a little man with a gimlet face, a decent chap, nothing particular about him save a piping cockney voice and a hobby for modelling ships to take home to his wife and family, who were waiting for him somewhere down Barking way. Poor souls! . . . Every second of his spare time was occupied in whittling down matches and in the cunning reefing of tiny knots, for a model of *The Berwick Law* was taking form and shape under his work-stained hands. He lingered every day as lovingly over it as any artist over his first Academy picture. I thought it rather a childish form of amusement, I remember; but I've come to think better of any one with a decent hobby.' He gave the ghost of a sigh. 'I wish I had one—I think.

'The cook, Evan Macleod, was a Highlander, a six-footer from Skye. I gathered bits of his history gradually. We became fast friends. He had been a second-mate once. Then there had been a descent to half steward, half deck-hand, on one of MacBrayne's West Highland steamers. Lord knows how he had come to drift over far seas. A restless youth, I think; and once he gave me a hint of his being in some bother that didn't make him very anxious to return; but Skye, he said, kept calling to him, and he wanted to see it again. Perhaps the sheer love of roaming had as much to do with his wanderings as anything. He was full of harmless superstitions of the Hebrides, and the adaptability and ingenuity of the Celt. He bore a resigned-to-fate expression wholly deceptive, for his gloom was but skin-deep, contradicted by a humorous mouth. A man of hair-trigger temper, the twinkle of his eye swiftly changing to a spark. A handy man was Evan, a decent cook too, keep him off the rum; but his abilities by no means ended at the galley-door. He could take his trick at the wheel, and knew something of navigation. Indeed, had it not been for him I shouldn't be here telling this story to-day. His earthly possessions consisted of the clothes he stood in, a fine baritone voice, and a concertina. He and I became good friends, and faced some unusual music together.

'The other three of the crew were Eric

Lowden, a youngster—an ordinary cub—called Callender, and myself.

'Lowden from the first was a mystery. In appearance he was slight, erect of frame, finely modelled, co-ordination in his build, and his dark face was the handsomest of the aquiline type that I've ever seen. Physically he was a surprise, for he was as hard as nails, and showed endurance unbelievable if one were to judge from his slim lines. In spite of his commonplace sailor's clothes, many a pretty girl at the Port threw him bright glances, but he paid them about as much heed as a wooden image might. He had joined the ship at Port o' Spain. I never discovered where he hailed from, for he literally never spoke an unnecessary word. He had one of the principal parts, this silent man, in the—the—the things that happened. He never joined in the chaffing and chatter of our scanty leisure forward, and would sit gloomily for long enough, with his head in his hands, listless and sad-eyed.

'A dozen little things gave me the idea—right, as it turned out—that he was out of his ambit berthing forward. But he was a splendid and a willing seaman. He could teach us all our business. His fitness commanded respect, and with it he obeyed the unwritten laws and courtesies of the republic of the fo'c'sle, where all men are equal except the man who doesn't know or won't do his job. Beyond the bare necessities of speech, however, scarcely a word could be got from him, and a something in his eye forbade even the inquisitive Evan to draw him.

'I felt a vague sympathy for him, for whatever was wrong with his world, he was evidently of the breed who "thole" and say nothing. Although silent he was not surly, and his voice (what little we heard of it) was singularly pleasant to the ear. One thing in him I cordially disliked. He was of the scarce and uncanny breed of those who talk to themselves. I saw him frequently, his lips moving, but I could catch nothing of what he said. I thought the unpleasant habit a bad sign, and in a couple of days an idea that I had grew into a belief. It was that the man wasn't normal. I can't lay my finger on the exact data on which I built my conviction. Chiefly, I think, my belief was helped by a curious gesture of his. He would throw up his head suddenly in the midst of one of his silent broodings, as if listening for something—something that he seemed to be half-wishing for, half-afraid of. Once, in one of these moments, his eye caught mine, and held it in the unblinking stare of a relentless animal until I looked somewhere else, vaguely irritated, and he resumed his sad, stolid gaze at nothing.

Fear was not the emotion I often diagnosed in his face. The look was more of nervous, overwrought expectancy. Sometimes his wistful, staring eyes looked to me to be nothing short of haunted. Then the next moment they would glow again like an animal's, and he would listen—listen—listen, until a dreadful thought would seize me, and I had a mind to run out and see if there was something or some one in the ship moving with a step that he alone of all men could hear. I am not superstitious, but I had an uneasy feeling that there was trouble on board. So it turned out, though the trouble arose from flesh and blood, primordial, not from messengers from the underworld.

Well, on the third evening out, Martinique on the beam, Evan Macleod the cook and I had "forgathered." The *Berwick Law* was making headway in the North-East Trades, and the sky gave promise of fine weather. Evan and I were leaning over the weather-rail, listening to the water buzzing cheerfully under us, and watching a fairy sea, for our track gleamed with molten phosphorescence, and the arch of the sky was clear to the zenith.

"What will you be makin' of Lowden?" asked Evan. The soft west accent had never left him.

"Well"—I began.

"Wheesht, man!" was the whispered interruption, with a nudge from Evan's stalwart elbow. "He's chust behind us."

"I looked round, but could see no one. "Nobody about. You're dreaming, Evan," I said, keeping my voice low.

"Dreamin'," is it? We'll take a smahl walk," quoth he, and we turned and took a couple of steps quietly forward. Evan halted and jerked a thumb to the lee between the main-hatch and the galley, where, sure enough, Lowden was standing. He did not see us. He was facing aft, both hands clenched, his head in the listening pose that I had remarked. He was deathly pale, his eyes burning, almost unreason in them, I thought. His lips were moving, but no speech came from them that we could hear. I stood for a moment, fear mingling with my amazement. I see him now, even at

this distance. I felt as if I was watching a sorrowful devil communing with evil. He put a hand over his eyes as if to shut out a black memory.

Evan clutched my arm, a gulp in his throat. "Come away," he whispered; and we stole round in the shadow of the galley. "It—it's no canny to be lookin' at a man seein' things like what he will be seein'."

We went back again softly to the rail and waited in silence. I thought I heard a sound, half-groan, half-curse; then the solitary figure moved slowly away without a glance in our direction. We watched it go forward and disappear into the fo'c's'le.

"Well, what do you make of that, Evan?" I asked in a whisper.

The Celt rose like a cork to Evan's surface. "Every ship, they say, will be havin' drowned sailors' voices talkin' to her. Oh, but yess," he said, seeing me smile; "an' for those who hear them it is a warnin' that they too will soon be dead. There was my own mother's sister's son, goin' round the Mull o' Kintyre in the old *Clydesdale*. What does he hear one night in the first wa-atch but a wailin' voice out of the watter, an' there was the drowned wet face of a man with great starin' eyes, an' it looked at him the wance an' went down again!"

"Very likely a seal, Evan," I suggested, not without mischief.

"A seal! How could it be a seal at ahl, when my cousin was fery sick after at the Kyle, an' the poor man died of a fever in fower days?" asked Evan with indignation.

I forbore from arraigning the remarkable logic of this psychical manifestation. Indeed, I knew that it would have been useless; and Evan went on wrathfully, "But of course there are people who know about everything an' will not believe their own eyes, nor anypody else's. No; I tell you that we shall be seein' fery strange doin's—yess!—before we'll be abeam o' Ailsa Craig again." Then, considerably ruffled, he retired into his galley.

I paid but little attention at the time to his gloomy "haverings." But Evan was right.

(To be continued.)

STUDIES IN BIRD MIGRATION.

By the Hon. G. GRAHAM-MURRAY.

THE subject of bird migration is an aspect of ornithological study which until lately was shrouded in mystery. Even now there remains an element of mystery, that ultimate mystery which underlies all nature and all life.

To the writer of this article the geographical and the physical aspects of migration are two entrancing lines of study, and to any one interested in such subjects it is difficult to imagine

any work which gives more food for reflection than the one before us (*Studies in Bird Migration*, by W. Eagle Clarke: Oliver & Boyd). The amount of serious study embodied in these two volumes can only be described by the word 'prodigious.'

Mr Eagle Clarke tells the reader in his preface that in the year 1880 he began seriously to study the question of bird migration, and that in 1883 he was elected a member of the British

Association Committee on the Migration of Birds as observed on the British and Irish coasts. The preparing and issuing of these reports was only completed in 1903. Thus for twenty-three years Mr Eagle Clarke worked through these digests, sifting carefully every atom of the data; whilst, in addition to this work, he resided for forty-seven weeks in lighthouses and lightships in order to study the subject at first-hand. Can it, then, be wondered at that the author has produced a record which, in its line, is quite unequalled?

The first two chapters deal with ancient and modern views on migration. It is unnecessary to allude here to the views of the ancients on this subject; but in Chapter II. certain problems at once spring into being, and it is just in tackling such problems that the author reveals his profound learning.

The migration of birds seems largely to depend on food-supply, though be it noted this does not, of course, account for the *impulse* to migrate, or for the *origin* of the migratory habit; but the author advances theories to account for both impulse and origin. The fact that the bulk of all bird migration takes place by night at once gives rise to the puzzling question as to how the migrants are guided; and Mr Eagle Clarke discusses this point closely, giving the reader the benefit of his personal observations.

Chapter III. is devoted to 'The British Isles and their Migratory Birds,' whilst appendices give the lists of 'Summer Visitors,' 'Partial Migrants,' 'Winter Visitors,' and 'Birds of Passage.'

In Chapter IV. the geographical aspects of British bird migration are dealt with, and this includes the important subject of migration routes. It is wonderfully interesting to learn that birds are no haphazard travellers, but adhere to regular geographical fly-lines.

Chapters V., VI., and VII. are entitled 'Round the Year in the British Isles,' and in these the annual cycle of migration is dealt with.

Autumn marks the departure of the summer birds from our coasts; and Mr Eagle Clarke tells us that 'the various migrants usually follow the same lines of flight, but in a reverse direction, as in the spring.' The different birds leave at different dates; whilst, besides migration proper, there is a large amount of local movement among the semi-resident species.

The month of October welcomes to our shores the winter visitors, and in the carefully compiled appendix a list, with dates, is given of the arrival of these different winter birds. Winter is somewhat of a dead season, whilst spring is naturally *the* time of all the year. The chapter dealing with vernal migration is perhaps one of the most interesting portions of the whole work.

The meteorology of bird migration is a subject which has received but scant attention, and

therefore the chapter devoted to this aspect reveals absolutely new conditions and conclusions. Special weather charts have been inserted, including two particularly interesting ones depicting the advance of spring and autumn across Europe. The careful study of these charts helps to elucidate to the reader the various points connected with the weather influences.

The reader of these studies will probably be anxious to follow the journeys of different specific birds, and this he is enabled to do. Certain chapters are concerned with the migrations of the swallow, fieldfare, white wagtail, song-thrush, skylark, lapwing, starling, and rook. The various seasonal movements of each of these birds are most carefully gone into, the geographical routes of their migrations and emigrations are shown, and exact chronological data are afforded. The thoughtful study and the painstaking labour which are revealed by the perusal of these chapters must impress any serious reader, as must also the fact of the *complexity* of migration.

The last chapter of the first volume relates the author's experiences during a month spent in the Eddystone Lighthouse. Here again Mr Eagle Clarke records with the greatest precision the emigratory movements of the different birds on their autumnal journeys.

During the autumn of 1903 Mr Eagle Clarke spent a month on board the Kentish Knock Lightship with the view of studying the complexities of the autumn 'rushes.' In the chapter which he devotes to his experiences there a vast amount of information is forthcoming, dealing with every aspect of the phenomena. The height at which birds fly when migrating is a much-debated question; and, though the author acknowledges that under certain conditions birds do fly at great heights, he gives instances of 'rushes' when they were to be seen 'just skimming the crests of the waves and never departing from a true east-to-west course.'

Again, the speed at which migrating birds fly is another moot point upon which Mr Eagle Clarke is able to throw light. He writes that, 'speaking generally, the migrants pursued their way at the steady rate characteristic of their respective species. There was no hurry, though certain species habitually fly faster than others. Thus the flight of the meadow-pipit was slower than that of the other species observed; that of the skylarks, chaffinches, wagtails, and others was decidedly faster; whilst that of the starlings, martins, and swallows was the speediest of all.' Mr Eagle Clarke calculated that the skylarks were flying at the rate of twenty-five miles per hour, whilst the starlings averaged from thirty-five to forty miles per hour.

Fair Isle lies midway between the Orkney and Shetland groups, being twenty-four miles south-

south-west from Sumburgh Head, and twenty-six miles east-north-east of North Ronaldshay. It is an irregularly oblong isle, having a length of two and three-quarter miles, a breadth of one mile, and a circumference just short of twenty miles, whilst it is almost surrounded by a belt of precipitous cliffs which rise from one hundred to six hundred feet in height. To this wild northern spot Mr Eagle Clarke made five consecutive visits in the autumns of 1905-9, also three spring visits in the years 1909-11, with the result that he has named the island 'the British Heligoland.' It is impossible to realise the importance of the investigations carried on at Fair Isle unless one reads the chapter which the author has devoted to the subject. In an article such as the present one can but notice a few of the many interesting points.

Mr Eagle Clarke tells us that, as a result of six and a half years' investigations on Fair Isle, it is now known to have been visited by two hundred and seven species of birds—that is, about half the number of birds that have been recorded as occurring in the British Isles. The author goes on to tell us that 'the knowledge gained from the Fair Isle statistics has thrown a flood of light upon obscure migrations such as was never before possessed for the British Isles.'

The appendix which is added to this chapter gives a complete list of all the birds observed, whilst a diary of the year allows the reader to see the dates of arrival and departure of the different species, as well as the records of the 'rushes.' To the writer of this article the chapter on 'A Year with the Migratory Birds at Fair Isle' is perhaps the most interesting in the whole work. The 5th May is recorded as one of the best days in the season for migrants; the 7th May produced the first sedge-warbler of the season; whilst the bulletin of 14th May includes two Savi's warblers, a grasshopper-warbler, ortolan buntings, sedge-warblers, pied flycatchers, and numbers of tree-pipits. The first cuckoo of the season is noted on 15th May, also the first lesser whitethroat; and other arrivals on that date include garden-warblers, redstarts, and willow-wrens. Again, on 18th May four blue-headed wagtails and two white wagtails are noted; whilst the 1st June proved another red-letter day, a dozen red-spotted bluethroats being included among the visitors.

So all through the summer a certain amount of data is always forthcoming, until the autumn, when the great southward rush begins, September and October being the busiest months.

The last entry is for 31st December, and is as follows: 'Mallards, three; teal, one; golden plover, one; black-headed and common gulls were present in small numbers; lapwings about seventy; fieldfares about a hundred.'

'St Kilda enjoys the distinction of being the remotest of all the isles in the British seas. It

Far in the watery waste, where his broad wave
From world to world the vast Atlantic rolls—

in latitude 57 degrees 48 minutes 35 seconds north, and in longitude 8 degrees 35 minutes 30 seconds west, and is over forty miles west of North Uist.' In the autumn of 1910 Mr Eagle Clarke spent some six weeks on this far-off and lonely spot, returning again in the following year, always with the view of studying the migration problem. The author gives a vivid account of the hardships and privations of life on St Kilda, and he also tells us that the island 'lies on the very verge of that enormous stream of migration which rushes along the British coasts to and from northern Europe.' Ninety-six species of birds came under his notice, of which 'sixty-two were migrant visitors, chiefly on their passage southwards to winter quarters, whilst fourteen were mere waifs. No less than forty-eight were new to the avi-fauna of the St Kilda group, whilst two were new to Scotland, and one to Britain.'

The bird new to the British list was the American pipit, those to the Scotch the marsh warbler and Baird's sandpiper. Other rare species to be noted included 'scarlet grosbeaks, ortolan buntings, Lapland buntings, barred warbler, black-throated chat, ruff, and great snipe.' The summer birds of passage included garden-warblers, redstarts, whitethroats, black-caps, willow-wrens, and chiff-chaffs; and Mr Eagle Clarke tells us that the most abundant species observed on passage at St Kilda were the wheatear, white wagtail, and meadow-pipit.

The Flannan Islands, situated to the westward of Lewis, were the objects of an autumnal visit in 1904. These sea-girt isles are the annual breeding-quarters of thousands of sea-fowl, amongst them the puffin, fork-tailed petrel, and fulmar. Ornithologically, however, the chief interest in these islands lies in the stream of birds which pass on their spring and autumn migrations; and Mr Eagle Clarke tells us that the avi-fauna stands at one hundred and fifteen species. In the appendix complete and ample data are given of the visits of the different birds.

The small island of Skule Skerry (thirty-five miles north-west of Hoy Head, Orkney) supplied the author with some further data concerning migration. An interesting fact in connection with this island is that from the list of the one hundred and three species recorded as having been seen the starling and the skylark were both absent. Rarities included the northern race of the willow-warbler and the Siberian chiff-chaff.

Mr Eagle Clarke has devoted his final chapter to an account of his visit to the Isle of Ushant, also to some remarks on the migrant birds as observed at Alderney. It is amusing to read that at Ushant the author and his companion were suspected of being spies, and a special gendarme was set to watch them. Police supervision is not conducive to bird-watching.

It is impossible to close a work such as *Studies in Bird Migration* without realising that this is an age of specialisation, and that this work is the outcome of years of the most painstaking and assiduous study. So charmingly is the work written that it is easy to read through the pages in a short time, but to digest the information thoroughly requires prolonged study.

No one who is interested in the subject of bird migration can fail to be grateful to Mr Eagle Clarke for his delightful record, which enables the reader to become initiated into the marvellous perplexities and mystery of migration. In conclusion, may we congratulate the publishers on issuing the work in two volumes?

THE RABBITS OF GLENDARGUE.

By C. J. DE TOLLY BARCLAY.

'WE canna pay oor rent. The rabbits ha'e eaten us out; oor cattle an' horses are starvin'; oor sheep are dyin' for want o' pasture; oor turnips are eaten to the gr'und. Winter 'll soon be on us, an' we are destitute.' Thus spake the tenantry of the estate of Glendargue, in Scotland.

The factor listened wearily. It was an old story. He had repeatedly sent orders to the gamekeepers to keep the pest within due limits; but still the tenants complained, and this was the climax.

It was rent-collection day. The one long street of the quiet, decorous village presented its semi-annual scene of bustle and animation. Men of burly port and with weather-beaten faces stood in groups, discussing things past, present, and to come. High-stepping horses in shining harness pulling high gigs or smart two-wheeled dogcarts passed and repassed.

Inside the village school the factor sat in his arm-chair, greeting, talking, listening; the clerks at the table were silently counting, receipting; the big wash-hand bowls full to overflowing with notes and bills of all denominations, the smaller bowls heavy with coin. At three o'clock the banker from the 'toon' entered, and with swift skill counted and checked the bullion into his bags, then drove rapidly away to his safety-vaults.

Now came the event of the day to us youngsters—the rent-dinner in the village inn, an event of no less importance to the innkeeper than to us. We sat down to generous, substantial country fare, ordering with more or less concealed importance what we desired, and eating as only those can eat in whom the tide of life is flowing fast.

Glendargue, situated on a firth on the coast of Scotland, is a ravine covered with a sparse growth of gorse and bracken, and varies from one hundred to thirty yards in width and runs inland eight or ten miles. The tiny stream at the bottom is the boundary between two estates.

This was before the Ground Game Act was framed to give tenant farmers the right to kill fur-bearing game. To kill a compound-interest-multiplying rabbit was a criminal act.

A few days after the rent-collection, Mr Smedden and Mr Loneburn, the factors for the two estates, sat over their wine.

Said Mr Smedden, 'The rabbit-pest at Glendargue is getting to be a serious problem. I do not understand it. I have sent repeated orders to the keepers to keep them down, and from the game-dealers' accounts they seem to be doing their work.'

'That is so. I am in the same position,' assented Mr Loneburn.

'I promised the tenants,' continued Mr Smedden, 'that I would investigate the case, and I shall send the boy to-morrow to look into it and report.'

'Very good,' was the reply; 'and as I shall be in this district to-morrow, I will drop into your office and hear what he says. There is a screw loose somewhere, I am thinking.'

Next morning I took the beautiful, fascinating road to Glendargue. It is a macadamised mountain trail even more crooked than a mountain railway. It ascends and descends with terrific gradients that are a terror to horseflesh, a trial to pedestrians who do not have the love of nature in their hearts, and hopeless, heart-breaking anathema to the luckless wight that cycles. It is unexpectation long drawn out with its elbow turns, and winding curves, and headlong dips into bosky dells where sparkling streamlets flow; and with wide reaches of purple moorland where grouse and curlew hide amidst black, sullen tarns in gloomy hollows. It is an undecided point with me whether they or the thin, white, flickering flames of a dying camp-fire in the gloom and silence of a vast mountain-side form the fittest emblem of solitude.

There are glimpses of the blue, glittering waters of our bonny firth, with a haze of hills on the other side; of far-flung views of bays of silver and coves of golden sand; of headland, dune, and crag; of stupendous cliffs and mighty caves where echoes reverberate, roll, and whisper away, the homes of innumerable seabirds whose white wings seem never to weary; of ruined castles with massive arches, gray, haunted by bats and owls, and traditions of knightly deeds that stir the heart, or unknighly deeds that bring the flush of shame.

There is a narrow, winding road that, branching off, leads to a quiet, green place above the sea, the home of the long-forgotten dead, their memory-

stones obliterated by time or tottering in decay; nameless, low mounds where Saxons, Danes, and Norsemen sleep; and ruined churches whose crumbling walls once echoed to armoured feet and the clang of martial men.

There are quaint fishing-villages that see the sun only in the afternoon; and the wayfarer can lean over the fence at the roadside and gaze at the black muzzles of the chimneys below. There is the Needle's Eye, through which you can, if you wish, crawl for fifty yards or so on hands and knees, saving yourself a wearisome detour of three or four miles. A curious sight it is, and uncanny, if you should be the first to reach the other end, to look back and see your friends coming, their white hands alternately rising and falling, their eyes glaring in the gloom as if they were wild beasts advancing on their prey. There is the green hill set inland at which you will be surprised to see the spray of old ocean issuing like smoke from an unseen cavity. This is Hell's Lum (chimney). A friend whom I took down declared he smelt sulphur and brimstone, and in the grinding of the distant waves heard the dismal wail of perdition.

Putting up my horse at the gamekeeper's lodge at the entrance to the Glen of Dargue, I ascended a footpath that led to the farm of Kelpie Wells. Auld Donald, the farmer, whose enormous bulk had weathered seventy years of sun and storm, greeted me with the gracious, kindly bearing of the old to the young.

'Weel, Jock,' he said, 'how are ye? Ye ha'e been lang a stranger hereabouts. Gang awa' ben, laddie, an' we'll ha'e a nip. Hoots, man! Come awa'. Fat fails ye? Na, na! it's niver ower early.'

I followed him into the best room, well knowing the ordeal I had to face.

'This stuff niver saw the gauger's e'e,' he said with a chuckle, as he handed me the fiery potion clear as crystal and of brain-spinning aroma. Lucky for the exciseman, I thought, as the hell-brew flowed down my throat, the fumes going to my unseasoned brain as if they were steam from unholy witches' cauldron.

'Noo tak' anither drammie to pit that till's bed.'

'Not another drop, Donald,' I gasped. 'I came to see'—

'Tak' anither; 'twill dae ye nae hairm. Bide a wee wi' yer havers, ma mannie, an' tak' it doon.'

'Thanks, Donald; but I don't want the roots of my hair burnt. I came to see you about those rabbits,' I cried, again seizing my advantage while he elevated the horn.

'The rabbits!' he said with a sigh as he set down the goblet. 'Eh man, they're terrible, terrible! They fair swarm a' ower the place. In fact, ma wife was sayin' she would soon ha'e to sweep them oot o' the hoose wi' her besom. We'll awa' oot an' lat ye see them. Bit ye ha'e nae teen yer dram.'

But I had made my escape into the outer air.

We walked along a farm-road with a high hedge on each side.

I was saying, 'It seems to me you people down here are making a big noise over nothing. The receipts from the game-dealers show'—

As we came to a gap in the hedge Donald pointed.

I looked, and was stunned into silence. I saw a once promising field of turnips a creeping, dark-coloured mass of rabbits, quietly, silently, unconcernedly feeding with slow, stealthy movements. A pair of ears or a head and shoulders rose occasionally into view, and sank again into uniformity; here and there the flash of a white tail showed. The turnips, gnawed into fantastic shapes, gleamed white against the dark ground like skulls on a field of terrific slaughter. It was a monstrous, insatiable army of devastation moving its serried ranks in slow irresistibility.

'Good God!' I exclaimed, 'how long has it been like this? Why did you not tell us? The winter will soon be on us! The keepers have been told to keep them down. Where are they? What are they about?'

'A blate [timid] cat mak's a prood mouse,' was the reply. 'The keepers are at war ane wi' anither, an' winna speak in the passin'. They winna co-operate, bit dee a bit shootin' on their ain side o' the watter, an' fat's that in a thrang like you?'

Promising relief, I bade him good-bye, and proceeded on my way to the glen, crossing once fat fields eaten to the roots. Rabbits, rabbits everywhere—gray, black, white, black-and-white, gray-and-white (ministers and monks we used to call them)—moved in countless numbers, their white tails seeming like white flowers dancing in the sun. The fields sloped to the ravine, and the ravine itself was honeycombed with holes; the slipping in and out and ceaseless activity of the nimble creatures giving a curious fluttering aspect to the landscape.

Within a few hours I had completed my investigation and faced the factors in the office.

'Well, Jock, did auld Donal' mak' ye fou with his "hamespun"?', said Mr Loneburn, with a shrewd glance and a twinkle in his eyes.

'Did you see any rabbits?' Mr Smedden asked with a smile.

'Rabbits! The country's inundated with them. The Deluge was a drizzly fog to them; the ten plagues of Egypt fade into insignificance beside them! You can't walk around without stepping on them. If you sit down they'll jump into your pockets and leave their young in them!'

Mr Loneburn laughed his noisy laugh and slapped his leg. Mr Smedden looked at me reprovingly; but there was a twinkle in his eyes, and his lips were compressed into more than their wonted sternness.

'The keepers on the two estates,' I continued, 'are cat and dog to each other; and although they are shooting, trapping, and netting on their

side of the boundary, they do not work together, and for the want of systematic warfare the rabbits go on with their destruction and multiplying habits practically unchecked. The fields are so tainted with them that the stock will not eat. The farmers have to rent pasture some distance away, and turn their stock there; and the winter will soon be on them, and there is no fodder.'

The grave, stern-faced men sat a while in silence. Then Mr Smedden said, 'Issue notices for a three days' public rabbit-shoot this day week. See the innkeepers about conveyances and supplying refreshments. Have tables and benches placed where convenient, and engage dressers to prepare the rabbits for the markets; and have carts in readiness to take them to the station. Make out a list of hospitals and such-like institutions to take what the market can't. You will take charge of the proceedings, and we will arrange to have two or three policemen to'—

'To see,' interpolated Mr Loneburn dryly, 'that the amber fluid is sufficiently diluted for the due preservation of law and order.'

'To assist you,' continued Mr Smedden, 'in checking any reckless or careless behaviour. Have the rowdy ones sent home, whoever they may be.'

'And,' added Mr Loneburn, 'all the estate employes are under your orders from this time until the proceedings are over.'

The day dawned clear. With my friend Jack Lonly—occupation, farmer; chief diversion, practical jokes—I was early on the scene. The quiet, remote glen presented a picturesque and animated aspect as the gunners arrived—doctors, lawyers, sporting parsons, farmers, fishermen, and every poacher from the near and remote neighbourhood, all filled with keen anticipation and eager joyousness, bringing with them dogs of every conceivable breed and nation, from useless, stately, kindly St Bernards to fussy, impudent terriers. They were a study in colour and noise. Their clamour filled the air. There seemed to be a dog-fight in every corner.

In time order evolved out of chaos. The gunners who wished to walk were assigned to walking squads. Those not so energetic were stationed on the edge of the ravine about thirty yards or so apart. Gamekeepers and assistants with retrievers and ferret-boxes containing five or six ferrets slung over their shoulders took their places in the ravine.

When the signal was given, the muzzled, sinister, snaky-looking animals were placed in rabbit-burrows, their mission being to follow the burrows in all their ramifications and drive out the rabbits.

The air became filled with the crackle of shots, which, increasing and decreasing in intensity, never ceased all the long day. Soldiers smiled reminiscently and talked of battles in far lands. A war-scarred colonel in immaculate shooting-

costume approached. 'The finest sport I ever had,' he said, 'was in the Zulu war. The Zulus would hide behind trees and bushes, and pot at us as we advanced, and when we came too close would break cover and run. We turned them up like rabbits;' and the hard, lean face relaxed at the happy recollection.

The walking squad tramped to and fro in orderly lines, wheeling at the word of command—discipline rigidly maintained. At the end of a beat those who desired would change with those at the stations.

A stream of carriers formed between the fields and dressing-tables, the dressers and packers working with might and main.

The rabbits, under the merciless persecution, lost all fear of man. Some, running in bewilderment a short distance, would lie down, to be kicked or clubbed; others wandered about with pathetic, fear-smitten eyes. They sought shelter under door-steps, in stables and byres, even under the stools of the dressers. One was seen crouching at the heels of a stationed gunner who was too intent to look behind. The very dogs wearied of their job, and refused to fetch and carry, slinking shamefacedly at the heels of their masters. The farm cats, gorged to repletion, lay at the corners of buildings and eyed with languid curiosity the helpless creatures as they sought some place to hide.

The air became laden with sulphurous fumes and the stench of the shambles. Men sickened, but stuck grimly to their posts; others seemed to be filled with an insatiable lust for blood, and, with glittering eyes and tense faces, they remorselessly killed the unfortunate animals. Pity seemed dead, charity fled. They were automatic killing-machines, belching flame and smoke.

In the evening, as the fire was beginning to slacken, shouts arose that filled my heart with fear. 'A minister shot! A minister killed!' 'Who is it?' 'Who killed him?' 'Jack Lonly! Jack Lonly's shot a minister!'

I stood numbed and dazed, noting vaguely the dying away of the detonation as the swift news travelled far. An intense stillness prevailed. Men passed me with white, drawn faces and eyes of horror. One thought repeated itself over and over again with grievous monotone, 'What an end to such a day!'

The setting sun glared at me, a red, fiery eye that seemed to accuse and hold me responsible for this awful deed. I staggered a few steps blindly. A soft breeze swept over my face, bringing a cooling sense of consolation and peace, of courage and resolution. Recovering myself, I descended rapidly to the ominous, silent group standing with grave, bowed heads. As I approached they made way for me, turning aside to conceal their emotion. Their shoulders heaved; their faces worked strangely.

Walking up to Jack Lonly, I looked at him. He regarded me with grave, steady eyes. With

difficulty my lips framed the question, 'Who is it? Is he killed?'

Deep, grave tones behind me said, 'Yes, he is killed.'

Wheeling round to the speaker, I exclaimed, 'Did you do it? Who is it?' and in an awed whisper, 'Where is he?'

'Here he is,' said Jack Lonly, holding up a black rabbit with a narrow band of white round its neck and another down its breast. I gazed at the animal stupidly. The raucous noise of multitudinous laughter boomed in my ears. Then kindly hands restrained me.

THE MAGIC OF PHRASES.

By G. P. GORDON.

DE QUINCEY tells us of the great influence which certain passages in his reading exercised upon his mind by reason of their mystic sense of power. One of these was the sentence in the Book of Daniel: 'Belshazzar the king made a great feast to a thousand of his lords.' Similarly with the opening scene in Macbeth:

When shall we three meet again,
In thunder, lightning, or in rain?

He attached an ineffable feeling of sublimity to the lines in the Epilogue to the Second Book of the *Fables of Phædrus*: 'A colossal statue did the Athenians raise to Æeop, and a poor pariah slave they planted upon an everlasting pedestal;' and this word 'pariah' is often to be met with in his writings. 'Shall I be thought fantastical,' says Charles Lamb, 'if I confess that the names of some of our poets sound sweeter and have a finer relish to the ear—to me at least—than that of Milton or of Shakespeare? The sweetest names, which carry a perfume in the mention, are Kit Marlowe, Drayton, Drummond of Hawthornden, and Cowley.' We have all heard of the old woman who told her pastor that she found great support in 'that comfortable word Mesopotamia.' Whether the story is true or not, it is told of the celebrated Methodist preacher George Whitefield that he could reduce his hearers to tears, so persuasive was his eloquence, merely by uttering the word Mesopotamia. Garrick, who greatly admired his preaching, is probably responsible for the tale, which is made use of in the modern novel, *The Silence of Dean Maitland*, where it is averred of the Dean 'that his pronunciation of Mesopotamia caused the listeners' hearts to vibrate with every sorrow and every joy they had ever known, all in the brief space occupied by the utterance of that affecting word.'

In the creation of telling phrases the French are supreme. The phrase is the tyrant of our century, it has been remarked by a Frenchman, and no people have been more influenced by its use. More often than not the sound of the phrase is more excellent than its sense. It tends to become a mere catchword calculated to mislead its hearers. Curiously enough, the French Revolutionary motto, 'Liberty, Equality, Fraternity,' was not universally popular; for though its public use

was decreed by the Paris Directoire in 1791, it was dropped under the Consulate eight years later. It was, however, restored in the days of 1848, when telling phrases were much to the front. It is said that we owe the watchword 'Fraternity' to the Abbé Fauchet; but it is often a task of considerable difficulty to trace memorable words or phrases to their source; no one party or section of the nation has a monopoly in them. One of the best known, '*L'état, c'est moi*,' is a remark attributed to Louis the Fourteenth, which, at any rate, was more true to fact than that attributed to Napoleon the Third in a speech of the year 1852: '*L'empire, c'est la paix*.' 'There are no longer any Pyrenees' is another resounding phrase we owe to the Grand Monarque on the departure of the Duc d'Anjou to assume the kingship of Spain. Napoleon the First had a pretty gift in the framing of sententious phrases, one of which—'*La carrière ouverte au talents*'—was destined to more than ephemeral importance; or again, when, before the battle of the Pyramids, he exclaimed, 'Think that forty generations look down from these heights,' pointing with impassioned gesture to the majestic structures of the past. To be compared with this flight of rhetoric is the well-known remark of Canning, who, in acknowledging the independence of the Spanish-American colonies in 1823, boasted that he 'called the New World into existence to redress the balance of the Old.' Louis Philippe's reference to the 'happy medium' in a speech to a deputation of citizens eventually proved the keynote of his reign, which earned the rather contemptuous nickname of the 'government of the *juste milieu*.' M. Thiers, indeed, on his accession had declared 'the king reigns and does not govern.' Sometimes a highly debatable statement is made to appear as a self-evident truth, as where Proudhon answered the query propounded in his book, *What is Property?* in the celebrated phrase, '*La propriété, c'est le vol*.'

Not infrequently the historic phrase is of doubtful authenticity. Thus Siéyès is supposed to have remorselessly voted for the death of Louis the Sixteenth in the exclamation, '*La mort sans phrase*.' What he actually did, we are told, was to mount the tribune and say quietly, '*La*

mort,' and on hearing the declamatory speeches of those who succeeded him, to turn to his neighbours and say, '*J'ai voté la mort sans phrase.*' 'All is lost except honour' was supposed to be the sole contents of the letter in which Francis the First announced to his mother his overthrow at Pavia; but the letter, which enters into minute details of the battle, does not contain the phrase. It was not Cambronne who answered the English command to surrender at Waterloo by exclaiming, 'The Guard dies, but does not surrender.' The saying was, we are told, invented for him by a French journalist of the name of Rougemont. It comes, too, as somewhat of a shock to hear that the actual words of the Duke of Wellington at Waterloo were not, 'Up, Guards, and at them!' but simply, 'Stand up, Guards!' Several of the best-known phrases of the present time boast a considerable antiquity. Thus 'Three acres and a cow' dates at least from the time of Defoe, who in his *Tour* suggested that certain refugees from the Palatinate should be transferred to the New Forest. There the Government was to provide every man with three acres of ground and a certain quantity of common land where they could keep a few sheep or cows. The more immediate origin of the saying is doubtless Mill in his *Political Economy*, who, writing of peasant-farming in Flanders, says: 'Where the land is cultivated entirely by the spade, and no horses are kept, a cow is kept for every three acres of land.' The plausible-sounding sentence, 'The greatest happiness of the greatest number,' was employed by the philosopher Francis Hutcheson in 1725, though usually associated with the name of Bentham. The phrase 'Measures, not men,' can be traced as far back as Goldsmith. 'Measures, not men, have always been my mark,' says a character in *The Good Natur'd Man*. Canning in 1801, speaking of times of difficulty and danger, said, 'Away with the cant of "measures, not men"—the idle supposition that it is the harness and not the horses that draw the chariot along.' Earl Russell tells us in his *Recollections* that the cry of 'the Bill, the whole Bill, and nothing but the Bill,' owed its origin to Lord Brougham, and was intended to prevent the introduction of destructive amendments.

Even a well-worn sentence may be capable of a great effect if produced at the right moment, as when Lord Palmerston in 1850 introduced his '*Civis Romanus sum*' at the close of a five hours' speech in defence of his foreign policy. Alliteration often enables a phrase to catch the popular imagination, as in the case of the well-known caterer who invites the public to try the merits of 'Pearce and Plenty.'

The employment of words agreeing in sound if not in sense is a frequent rhetorical device. To a letter of Disraeli we are indebted for the phrase 'plundering and blundering,' which had previously been made use of in *Coningsby*; while

in 1874, as if in parody, Mr Gladstone spoke of the leader of the Opposition as 'floundering and foundering' in the Strait of Malacca, where at that date British interests were supposed to be involved. 'Meddle and muddle' was a term used by Lord Derby in 1864, and, like 'peace at any price,' is a sample of the large collection of alliterative phrases familiar to most of us. Extra emphasis is occasionally given to a sentence by the repetition of a word. Danton pins his faith on '*de l'audace, encore de l'audace, toujours de l'audace*,' to ensure success to the Revolution. Sir Robert Peel, speaking at Tamworth in 1839, said, 'The advice which has been given by some persons was, "Agitate, agitate, agitate!" The advice which I give you is, "Register, register, register!"' The sonorous phrase, 'Peace, Retrenchment, and Reform,' seems to have been current in the time of Earl Grey, and was referred to in a speech of John Bright in 1859 as the great watchword of thirty years ago.

Where events bear out the truth of the statement, a phrase may well become immortal, as the Duc de Liancourt's remark to Louis the Fourteenth, 'Sire, it is not a revolt; it is a revolution.' The statement that 'Providence is on the side of the big battalions' is of considerable age, being contained in a letter of Bussey Rabutin's in the year 1677, and repeated at a later day by Voltaire. The term 'the sovereign people' dates probably from an incident in 1798, when a certain nobleman, presiding at a dinner of the Whig Club, at the close of the evening gave as a toast, 'Our Sovereign—the People.'

Some sentences without the aid of alliteration manage to strike the imagination, as the 'leap in the dark' phrase attributed to Lord Derby on the third reading of the Reform Bill of 1867, and originally made use of by Hobbes, the author of *Leviathan*. 'Blood and iron' seems to sum up the policy of Bismarck; hence the popularity of the phrase, which he had employed in speaking of the position of Prussia among the states of Germany: 'The deputies must place the greatest possible weight of blood and iron in the hand of the King of Prussia, in order that according to his judgment he might throw it into one scale or the other.' The famous alternative offered by Gambetta to Marshal MacMahon was '*se soumettre ou se démettre*.'

The 'man in the street,' who is so often referred to at the present day, seems to have been known on the racecourse in the days of Greville, who in his *Memoirs* refers to "the man in the street," as we call him at Newmarket.' Emerson, in his essay on 'Self-Reliance,' writes: 'But the man in the street, finding no worth in himself which corresponds to the force which built a tower or sculptured a marble god, feels poor when he looks on these.' The 'man on the car' is the usual American equivalent. The phrase, 'To the victor belong the spoils'—that is, the rewards of office—was

employed in a speech in the Senate at New York by Marcey, an adherent of Andrew Jackson. We must 'educate our masters' was the advice of Mr Lowe, though his actual words on the third reading of the Reform Bill of 1867 were: 'I believe it will be absolutely necessary to compel our future masters to learn their letters.' The economic term 'a living wage' was first brought into prominence during a great miners' strike, and has since attained considerable notoriety. The well-known couplet,

Eight hours' work, eight hours' play,
Eight hours' sleep, and eight bob a day,

is supposed to be of Australian origin, and it was in the 'eighties that the question came prominently to the fore; although the German Socialist Karl Marx had advocated an eight hours day as far back as 1867. The ideal period of labour was put at only six hours by Sir Thomas More in his *Utopia*. Words, we know, are wise men's counters; but to many there is a magic in the repetition of a well-known word or phrase:

As when we dwell upon a word we know,
Repeating till the word we know so well
Becomes a wonder, and we know not why.

THE MONTH: SCIENCE AND ARTS.

A MECHANICAL FRANKER.

THE rapid growth of the mail-order system of business, and the wider use that is now made of the post-office for circularising by business houses, have been responsible for the introduction of an invention to economise time and labour in franking envelopes. Several mechanical devices for attaching postage-stamps to letters have been produced, but none of them has proved completely successful. The system of affixing stamps by hand is to be deprecated. Attempts have been made by the use of perforating devices to prevent dishonesty; but this precaution is not an effective safeguard against improper use. This object can best be attained by the utilisation of a mechanical device which, in addition to performing its designed purpose of affixing the stamp, infallibly records the number used, and thereby provides a check. The great objection to such devices hitherto has been the liability to tear or otherwise deface the stamp, as well as the bulkiness, weight, and initial cost of the appliance. What is required is a small, compact, infallible, and light machine, similar to the familiar one for dating, which can be slipped into the pocket. The latest appliance for franking letters appears to possess these requirements. It is called the *fixo*, and is a small tool, little larger than a date-stamp. It is strongly made, and cannot easily be damaged; while, as it is composed of few parts, the mechanism will not readily become deranged. The stamps, in a roll of five hundred, now sold by the Government, slip into a small drum, and are fed downwards to the base of the machine. A single pressure of the handle, which is similar to that of a dating-machine, detaches a stamp from the roll, moistens it, affixes it to the envelope, and records the operation upon a visible indicator. The machine adapts itself automatically to any variation in the gauge of the perforations, so that each stamp is fed exactly in the correct position. The stamps are moistened within the

machine by a tiny spray pump, so that the adhesive substance on the back of the stamp is only damped sufficiently to make it adhere. The stamps, being locked within the drum, cannot be tampered with, while an accurate record is kept by the indicator of the number used. The two edges of the machine act as a guide, so that the stamps are fixed symmetrically and neatly on the corner of the envelope. By the aid of this machine a beginner can frank two thousand letters per hour, but an expert can double this speed.

A MECHANICAL MILKMAID.

At the recent dairy-show held in London intense interest was displayed in a new type of milking-machine. The majority of such appliances work upon the suction principle, and are considered far from satisfactory as compared with the nimble, sensitive fingers of a milkmaid. In this device an effort is made to reproduce the action of the human fingers, both in shape and flexibility. The inventor is a Swedish engineer, Gustaf Johnsson. The milker is made of aluminium, and the power for moving the 'fingers' is supplied by an electric motor. The milking-machine was shown in operation, and evidently accomplished its work efficiently and without pain to the animal. It was demonstrated that four cows may be milked simultaneously by one installation, thereby not only reducing the cost of labour, but also effecting an appreciable saving in time. Of course, by this method the risk of contamination is lessened if the appliance is kept scrupulously clean; and this is no more difficult than the cleansing and sterilising of churns in a well-appointed dairy, where ample supplies of scalding water and steam are generally available.

MOVING PICTURES IN THE SCHOOL.

From time to time we have drawn attention in the columns of 'The Month' to the educational possibilities of the kinematograph and its superi-

ority in some cases in impressing the young mind as compared with the methods generally practised. The London County Council has made a forward move in this direction, and before many months have passed the kinematograph may become an indispensable unit in the equipment and curriculum of schools in the Metropolis. The danger of fire has been eliminated by the use of incombustible films, and the necessity for a fireproof cabin in which to operate the lantern has been completely overcome. The subjects to be handled are of infinite variety and interest, ranging through geography, history, physics, religious teaching, chemistry, and natural history. One or two of the leading manufacturers have placed upon the market a complete projecting apparatus designed for school use, which is massively built, rigid, and comparatively cheap. At first the films will be hired from the manufacturers, and the operator and plant will also be supplied under contract. As the movement develops and spreads there is no doubt that certain firms will devote their attention exclusively to the preparation of educational films, treating the subjects in a way that will make a strong appeal to the young mind. While there is no likelihood of the film superseding actual demonstrations and experiments in the study of the sciences, it will be to some extent a supplement. By the aid of the film the initial drudgery incidental to the elementary study of magnetism, for instance, will be lessened; and, from the teacher's point of view, the lessons will be taught under more congenial and impressive conditions. It is anticipated that the result of the experiments by the London County Council will be so successful as to commend the new method to the Government, so that the system may be adopted throughout the country.

WATERPROOFING DAMP BUILDINGS.

Judging from the results of practical applications under searching conditions, conspicuous success has been achieved by the use of ceresit in rendering damp buildings dry. This is a compound which, when added to cement, mortar, or concrete during building operations, renders the structure waterproof under all conditions. Attention was drawn in these columns to this material when it made its appearance upon the market some three years ago, and many Government departments, railway companies, and borough councils have subjected the medium to severe tests. Ceresit undoubtedly fulfils the claims of the inventor, and the faith of those who introduced the compound into these islands is demonstrated by the fact that in several special cases they have contracted to carry out the work. The Isolation Hospital of the Strood Rural District Council at Meopham, near Gravesend, Kent, has been waterproofed throughout with this material. Unfortunately damp is one of the most insidious foes of the modern house-

holder, especially if the builder has not devoted the requisite attention to the foundations, or owing to the situation of a dwelling or the soil upon which it stands. Rheumatism and similar complaints often result from dampness, so that the use of a material such as ceresit acts as a safeguard for the health of the inmates.

THE DANGER OF TINNED SHRIMPS.

Although the humble shrimp enters into a variety of comestibles which are sold in tins, and is apparently innocuous, extreme care should be taken as to the manner in which the contents are packed. If the condiment is in contact with the metal it should be regarded with suspicion, as ptomaine poisoning is likely to result from its consumption. The alkaline constituent of the shrimp sets up violent chemical action, and it has been found that tins containing shrimps corrode in a very short time. The alkali plays sad havoc with the hands of the workers in the factories, while it ruins leather, the footwear worn by the packers becoming perforated in a manner which recalls the action of acids. The manufacturers of these comestibles, once they realised the danger of such corrosive action, took steps to eliminate the risk, but it proved no easy matter. Finally it was discovered that if the shrimp is stored on the ice for a day the strength of the alkali is reduced very appreciably, and this practice is now followed. At the same time, the canners, as an extra precaution, have adopted the practice of placing the shrimp contents within a paper lining, so that there is no immediate contact with the tin. This has been found to obviate all risk, and accordingly people are warned of the dangers incidental to eating canned shrimp, either pure or associated with other foodstuffs, unless the paper lining is used. Bearing in mind the extreme susceptibility of canned crustaceans, such as the crab and the lobster, to convey ptomaine poison, the notification of this danger in connection with the shrimp should be taken to heart.

NORTH-WEST VICTORIA.

An Australian correspondent points out that in many quite recent maps of Australia, and even in detailed maps of Victoria, the north-west portion of that state is shown as being largely covered with 'impenetrable mallee scrub.' This is not now the case. That section of Victoria is now well settled and intersected with railways; it is a very extensive and thriving wheat-growing area. It was formerly a great scrub desert, breeding wild dogs and rabbits, and thus a curse to the settlers near it. But the German farmers from South Australia taught their Victorian neighbours how to clear the scrub by rolling it down with immense rollers seven or eight feet in diameter—old mine-boilers are used for this work—drawn by teams of twenty to thirty

bullocks. After the scrub has been rolled down it is burnt. A local invention, the stump-jump plough, enables the ground to be ploughed without taking out the stumps; these rot out after a few years' cultivation. Another local invention, the stripper-harvester, harvests the grain, doing the work of a stripper and threshing-machine at one operation, and filling the grain direct into the bags. So successful has wheat-farming been there that at every meeting of the Land Board, when the Government allots land available for farmers, there are usually four to six applicants for each block. The light rainfall and dry, warm climate produce a very excellent milling (hard) wheat.

TWO INTERESTING BRIDGES.

In the article on Sir William Arrol at page 12 reference is made to the construction by his firm of a great bridge over the river Trent at Keadby, Lincolnshire. As the waterway at this point is extensively used, it was necessary that the bridge should be of such a type as to reduce obstruction to navigation to the minimum. The various systems of moving bridges in operation were investigated, and finally the engineers decided upon adopting the American Scherzer bascule type. The rising leaf will be one hundred and sixty feet in length by sixty feet wide, and the bridge will rank as one of the largest bascule bridges in the world. The opening and closing of the bridge will be effected electrically, and will be accomplished in one minute. It is somewhat interesting to observe that although this type of bridge has been adopted for England, quite a different class has been installed over the Willamette River at Portland (Oregon), U.S.A., which is a far busier waterway than the Trent. This bridge is a massive structure, the central span of which over the main channel is lifted vertically by means of counterweights moving up and down in two lofty towers on each side of the moving section. The total weight of the latter is over fifteen hundred tons. This interesting bridge replaces one higher up the river, and the novel design was adopted after careful consideration as to meeting the conditions most effectively. On the average, the bridge will have to be opened seventy times per day. The most interesting feature of this bridge is its telescopic movements. The bridge has two levels—the lower for railway purposes and the upper for pedestrian and vehicular traffic; but the railway section can be lifted, if required, without disturbing the highway section, to permit the passage of small craft, the lower part telescoping, as it were, by rising upwards inside the vertical supports of the upper part of the bridge. The latter can also be raised, so that when the railway section is telescoped into the highway part, and this in turn is lifted to its extreme height, a space of one hundred and seventy-four feet at low-water is

provided, so that all but the very largest ships can proceed up the river.

A NOVEL PIPE-COUPLING.

Who has not suffered at one time or another from the inconvenience arising from the bursting of a lead water-pipe or from a broken gas-pipe? A trained workman has been essential to repair the joint effectively by wiping, but often the mishap occurs when such assistance is not readily available. An ingenious inventor has devised a novel coupling for such contingencies, which can be used by an intelligent person without any special training, and which requires no brazing, soldering, or any other similar operation. What is more, as exacting tests have proved conclusively, the joint becomes the strongest part. Seeing that there is no messiness in performing the operation, and that the repair can generally be effected within two or three minutes, the coupling very fully meets all requirements. The coupling is made up of an inner tubular ring-piece, tapered longitudinally on its outer surface and towards each end from the centre, which fits into a cap formed by one-half screwing over the other. In order to complete the joint all that is necessary is to sever the pipe at the point where it has burst, and to slip one part of the cap over each end. The end of the pipe is then 'belled' out slightly so as to allow the double tapered tubular ring-piece to be introduced. The two parts of the cap are then drawn together over the tubular ring-piece and screwed up, the cap comprising a male and female piece. As the cap is screwed up tightly the tapers of the tubular lining are driven farther and farther and more tightly into the ends of the pipe. When finished the joint is as sound and as tight as it can be made by wiping. At present the coupling is made in six sizes—from a quarter to three-quarters of an inch; and its use is sanctioned extensively by the authorities concerned, as it is found that the joint completely prevents both gas and water leakage. For connecting pipes to gas cookers and stoves it is ideal. It is also a useful adjunct to a farm and an estate, where during a severe winter a burst pipe is by no means unusual, as the defect can be effectively remedied by this ingenious invention without delay, skill, or tools.

MODERN PHILATELY.

Fifty years ago stamp-collecting was undergoing a transformation from which scientific philately was finally evolved. There were at that period two notable forces at work for the advancement of the hobby, in the distinguished and learned group of Parisian enthusiasts who forgathered in the tiny *magasin* of Madame Nicolas in the Rue Taillout, and the select coterie of English collectors whose rendezvous was an upper room in the ancient rectory of All Hallows Staining, in Mark Lane, London. Some idea of the

widespread popularity enjoyed to-day by stamp-collecting as a pastime may be gleaned from a reference-book for philatelists styled the *Whitaker of the Stamp World*, which contains a variety of information on matters connected with the pursuit of philately. From the list of philatelic societies of the world we gather that in Great Britain alone there are some forty-eight active societies of stamp-collectors, twenty-nine in various other parts of the British Empire, and fifty-four in the United States; whilst other leading foreign societies number sixty, including those in Algeria, Cuba, Dominican Republic, Siam, Hawaii, &c. Apart from the philatelic societies proper, over sixty names appear in the *Directory of British Stamp Exchange Clubs* for 1912. The importance and extent of the stamp-trade in modern commerce is revealed in the universal directory of the stamp-trade, containing the addresses of three hundred and twenty-five leading firms engaged in that trade throughout the world, of whom seventy-six are located in London, twelve in Paris, six in Berlin, and fourteen in New York. During the season 1911-12 some very important transactions took place, notably the purchase by Mr W. H. Peckitt, for a record sum, of the British colonial and the foreign sections of the celebrated collection of the Earl of Crawford. His lordship is still retaining the British and United States sections of his collection. The former section is prefaced by an almost complete unused sheet, containing one hundred and seventy-five copies of the first postage-stamp, the one penny black of 1840, and it is supplemented by a similar large unused block of one hundred and sixty-eight of the companion stamp, the rare twopenny blue 'without lines.' A part sheet of two hundred and nineteen stamps of the celebrated V.R. one penny official essay also finds a resting-place in this wonderful collection. The collection of the United States is acknowledged to be the finest and most comprehensive in the world. Another large transaction was the purchase by the firm of Bela Syekula, of Budapest, of the famous Hollitscher collection for the sum of forty thousand pounds. In the 'Story of the Year' is traced the progress of philately during the past twelve months, which, by the way, have witnessed the jubilee of that cult. Other useful articles and notes deal with 'The World's Postage-Stamp Printers,' 'British Colonial Key-Plates,' and the new Georgian stamps of Great Britain and her colonies. A large number of colonies have now issued new postage-stamps bearing the portrait of King George, and there are additional types and denominations in the home series. Very little originality has been shown in selecting the designs, and, except for the stamps of Barbados, Canada, and India, the Georgians are mere garish adaptations of their Edwardian predecessors. The appearance of these stamps marks the commencement of

a new era in the stamp album, and many collectors are starting to form collections composed entirely of Georgian stamps. A valuable check-list and guide to these issues to date is given in the new edition of the *Stamp Collectors' Annual*, in which are set forth the Georgian stamp issues of nine countries of the British Empire, together with details of prospective issues in other colonies. The list should be of great value to collectors who wish to keep their collections up to date. The *Stamp Collectors' Annual* is now in its tenth year, and is undoubtedly a volume that should be in the hands of all who favour the fascinating hobby of philately. It contains one hundred and ninety-six pages crowded with information, and is published by H. F. Johnson, 44 Fleet Street, London, E.C., at the modest price of one shilling net.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

WIND AND FROST.

WEAVING its spell of delight and despair,
Flith the wind through the trees that are bare;
And it reaches my heart through the wide-open
pane,
And it sings of the summers that laughed in the
lane,
It tells of the light on a far mountain's brow,
So desolate now.

Weaving its sword-spells on pool and on lake
Creeps the sinuous frost, with the eye of a snake;
And I look on its landscapes at morn, and the
mere
Is a picture of ghostland, a mirror of fear.
Twin-weavers, the wind and the frost, free and
far;
And how sharp is the star.

I am still, in a silence like that of the tomb,
But I know that, without, in the light and the
gloom,
Two weavers are rearing a bridge for the foe—
Old Winter—who watches the way that they go;
And the branch shouts their triumph, when
snapped from the tree,
But the leaf is to be.

WILLIAM J. GALLAGHER.

*. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

THE SERGEANT'S LUCK.

By ANDREW W. ARNOLD, Author of *The Attack on the Farm*, *The Colonel's Murillo*, *Pepita*, &c.

CHAPTER I.

'WELL, Sergeant Noriac, I am glad to see you back again,' said Captain Durand the night I arrived at Villena. 'I hear,' he continued with a smile, 'that you did very well as a commanding officer. Apart from old Viardot, you are the senior *sous officier* now, so it will be your own fault if before long you do not get a silver epaulette. But everything here is at a standstill; the country is dried up. It's fodder we want, and fodder we must have.'

Under a very young *sous lieutenant* named Finoy, with about a hundred conscripts, we had crossed the Pyrenees with a strong body of reinforcements; but from Chinchilla we had come on by ourselves. The terrible heat of the Spanish sun in July had rendered one-third of our little force useless. From his inexperience, our young commander had allowed us to fall into an ambush. I was with the rear-guard; but I got up in time to stay the panic and save his life, as he was badly wounded. Thus I, a mere sergeant, found myself in command when we arrived at Villena.

At this place, besides our own regiment, we found a battalion of infantry, some artillery, and a small body of pioneers, who had just arrived under the escort of a *peloton* of dragoons; but our colonel—who, I may state, was Lieutenant Finoy's uncle—was the senior officer.

Early the next morning we started foraging; but though new ground was tried, we had but little luck in that arid Murcian district, and truly the outlook was getting desperate.

I had often found I got good information from innkeepers if I only made it worth their while. I told my captain that, and it was not long before we came to an agreement with the landlord of the 'Crux de Malta,' the chief *posada* in the place. Our plan, indeed, took shape sooner than I had expected; for that very evening, while I was sitting with many others smoking and drinking in a vine-clad arbour at the back of the inn, the landlord drew me aside and told me he had found an *arriero* (muleteer) who could tell me something I should like to hear.

I found the fellow—a true Murcian, almost as dusky as a Moor—in the cellar, which was crowded with men, all of whom, with the

exception of two dragoons, belonged to my regiment.

'If it's fodder you want,' said the man in a low voice, looking round suspiciously, 'you can get plenty from the Monastery of St Francis of Assisi. The monks are mostly Italians, and they understand that sort of thing. They grow three crops a year of rye-grass, and they are getting in one crop now.'

'*Ma foi!*' I exclaimed with delight, 'where is the monastery?'

The simple fellow looked at me in amazement. 'What!' he said in astonishment; 'you have never heard of the Monastery of St Francis at Carlares? Why, thousands of pilgrims go there to kiss the holy statue made of solid silver. They have got a bone of the saint in a reliquary covered with jewels.'

He went on to tell me about the miraculous cure of his grandmother and other relatives; but I soon stopped him, and went off to find my captain. What I told the captain about the riches of the monastery made his mouth water.

'*Parbleu,*' he exclaimed, 'what a chance! I will go to the colonel.'

Now, we were under the supreme command of Marshal Suchet, who had superseded Moncey after the latter's defeat by Rico the monk when he attempted to take Valencia. Suchet was almost alone among the marshals who would allow no pillaging; but he, luckily for us, as we thought, was far away. Soon the captain came back quite radiant.

'Of course it's risky,' he said; 'but it's worth the risk. Keep that fellow under lock and key, and to-morrow morning at half-past four we will start, and if we make a *coup* I can promise you, sergeant, that you will soon get your epaulette.'

As I left him I met a patrol bringing in a couple of Spanish prisoners, but I paid little attention to that; and, after arranging for the wagons for the next morning, went to get what little rest I could, but for a time I could not get the captain's words about a commission out of my head.

A commission! Ah, how these words would

[All Rights Reserved.]

JANUARY 4, 1913.

have filled me with pride and ambition but a few years ago! But now there was something I desired more than that, which was to get back to France to marry Françoise Dubusson.

During the Revolution, in the sacred name of Progress and to set an example of the Rights of Man, an uncle of mine had helped himself to some land in Picardy. He was a true 'son of the people,' and knew more about filling his own pockets than about land; otherwise he would never have chosen the portion he did, for it was of the poorest quality. However, before he realised this he died, and the farm came to my father, who was his only brother, and a soldier. Alas! my father had not the capital to work it, and though we all slaved from morning till night, not only could we not make any money, but we actually had to borrow at high interest to keep the roof over our heads. Our neighbour Jacques Dubusson, another old soldier, who had got his farm by the same honourable means, was just in the same plight as ourselves. Then the time came, in 1806, for me to be a soldier, and two years were spent at the dépôt at Amiens, and in 1808 I went as a conscript to the Peninsula.

Spain at that time was virgin soil. We were in Ney's corps, and I took part in the sacking of the Cathedral of Toledo, the richest in the whole country. *Ma foi!* it was like what one reads of in Eastern fables—the jewels and the gold and silver we found—so that even I, a mere trooper, managed to get eight thousand francs. But we were soon called back to take part in the campaign at Wagram. Before I started for Austria, however, I got a short leave, and went back to our village fairly pleased with myself; for, apart from the loot, I had been made a brigadier, having shown, my superiors were good enough to say, a natural aptitude for a soldier's life.

But I was only a young fellow, and I spent, or, rather, squandered, two thousand francs of the money in enjoying myself right royally; but with the remainder I paid off all my father's debts and stocked his little farm; and even then I had over one thousand francs for him to bury, according to the custom of the country, in a place that only he, my mother, and I knew of.

Nearly three years had gone by since I had left home, and little Françoise Dubusson was then but a child; now she was seventeen. By her beauty—ay, and her shrewdness—she won my heart at once. But, alas! as I soon found, she was no ordinary girl. Her mother was now quite bedridden; and her father, broken down with worry and rheumatism, had taken to drink, and was alternately preternaturally gay, sullen, or morose. The whole work of the farm really fell to this plucky, high-spirited girl and a younger brother and sister. Naturally as blithe and frisky as a young filly, as she was, her cares had now given her a thoughtfulness beyond her years. I had the means, and I could and would have helped

her; but she was as reticent and as proud as Juno, and so I left her, trusting to luck that when I next came back I might find a way to her heart.

The campaign of Wagram was a very different affair from our promenade in Spain. However, I came back a *maréchal des logis*, but otherwise no richer than when I started. Of course, without my parents' permission I could not marry at all; but out of gratitude they said I could marry Françoise if I liked, and of course her parents would very much have liked me to do so. It was the confounded pride of the girl that stood in the way.

'What's the good of talking about marriage, Henri?' she said in her practical way. 'Father can hardly work, Jacques is but a lad, and Cécile is a child. Who is to keep the place together? Besides, I have got no *dot*.'

'If I don't mind that, why should you?' I replied.

'Well, I do,' she answered proudly.

'Only give me some sort of promise,' I urged.

'Well, I won't say yes, and I won't say no,' she replied. 'You go off to Spain again, and do some more of that Toledo business, and then I will see.'

'Trust me for that,' I answered; 'and when I come back perhaps I shall be a lieutenant—ay, perhaps a captain.'

'Ah, I don't want you to be a captain,' she answered hurriedly. 'Oh dear, no! You will want some one higher than me then.'

I said not a word—that admission was quite enough for me; she might be cold and haughty, but she had let the cat out of the bag now. Two days after, with a light heart, I set off for the dépôt. There I heard good news and bad. I found the regiment was under orders for Spain; but, alas! I was one of those ordered to remain behind.

'I am sorry to lose you for a time, sergeant,' said the colonel; 'but this time I mean to leave some one behind whom I can trust. The last half-drilled batch I received in Austria were a disgrace to the regiment, so I am leaving Captain Fourbert and you behind. I will see that as regards promotion it will make no difference to either of you.' The captain, unfortunately, was taken ill just before we started, and that is how it was that Lieutenant Finoy was in command.

Remembering Captain Durand's instructions to have everything ready, I was up early the next morning; but a great surprise awaited me.

'Sergeant,' said the captain, 'the chief has had important news. The whole regiment will have to reconnoitre. I shall not be able to come with you; neither will Lieutenant Finoy, as he is not strong enough yet. *Maréchal des logis-en-chef* Viardot will be in command, and you will merely have a *peloton* of forty men.'

'As regards the silver statue and the pictures, &c.,' I asked, 'are we to get them first, or the fodder?'

'The statue!' he exclaimed in apparent surprise. 'Oh, well, of course *Maréchal des logis* Viardot will use his own judgment about that;' and, turning on his heel, he departed.

It seemed to me from his manner there was something behind this, and I could not make it out. Old Viardot too—*Le Vieux Reynard*, as the men called him—was evidently in a more than usually sulky mood. The splendid old veteran—there was not a finer soldier in the regiment—was always taciturn, so I did not waste my breath in asking him for any explanation. In another moment he had given the sharp word of command, and we were off, taking the *arriero* with us, disguised in a military cloak, as he feared to be recognised.

We had not gone half a league when old Viardot said he felt ill. 'It's that cursed wine I had last night,' he said. 'I am going to get into the covered wagon with that Spanish rogue; so you, *Noriat*, will be in command.'

I saw nothing strange in this, and gladly took the responsibility. We had gone three leagues, and were riding through a cork-wood, gradually ascending as we did so, when I went to question the guide. In a quarter of an hour, he told me, he reckoned we should see the monastery; and soon through the trees as we descended into a valley we did so, and also a stream which wound round the sloping ridge it was built on.

The *arriero* also said the rye-grass fields were on the other side of the monastery, and that on descending into the valley we should come to a bridge, where we were to take the first turning to the right, and the road at the side of the stream would bring us to them.

The question now was whether to try to get the loot or the fodder first. I reckoned that as soon as the monks knew of our arrival they would at once bury or hide everything of value, so I decided on getting the loot first. No sooner had I come to this conclusion than one of the *religieux* said that he had seen some cavalry only two hundred metres in front of us, for the road took a sharp turn to the left down to the river, and they were going almost at right angles to us. This was terribly disconcerting, and I hurried on.

'There, can you see them,' said the man, 'just through that opening?'

I saw them sure enough, but for the life of me I could not make them out. The road was in a cutting, and one could only see their helmets.

'I've never seen "canaries" like these,' I said, completely puzzled; but at last, when they were nearing the bridge, what was our disgust to find that they were actually our own dragoons! Then I recalled the presence of the two in the cellar the previous night, and concluded that they must have heard the *arriero* telling me of the wealth of the monastery. They had learnt the time we should start, and, having only a light cart with them, had stolen a march on us.

I was consumed with rage, for I saw how completely we had been outwitted. Still, I clung to the hope that perhaps, after all, they were going only for fodder; so I hastened back and told the men to hurry up. We soon began to gain on the dragoons; but they must have heard the rumbling of our carts and seen us, for they suddenly broke into a sharp trot, and crossed the bridge just as we turned the corner to descend into the valley, and then we saw them gallop up the hill towards the building.

I was half-inclined, just to save my *amour propre*, to go off to the right, and thus give them the idea that we had never intended to do anything apart from getting fodder; but still there might be a chance that they were going for that purpose too, and did not know the way, and they might pass the monastery. So we kept straight on, in spite of the *arriero*, who kept telling us we were going wrong. At a smart trot we pressed on; but, alas! outside the gate we found the dragoons' horses waiting, with a few men to hold them.

Naturally, these fellows greeted us with great derision. 'You have come the day after the fair, my boys,' they cried.

'In what way?' I asked. 'We want fodder.'

'You don't generally find much of that on the top of a hill,' they answered.

'We know our business,' I replied in as casual a way as I could, and rode on.

There was for some distance a high wall at the side of the road, and passing by it, we came to some vines; but the wall which enclosed the huge garden went at right angles some distance down the hill.

Taking three men with me, I rode down at the side of it. On the other side I could hear the jokes and laughter, mostly at our expense, and the clank of the spades, of the dragoons. Standing on my saddle, I looked over the wall, and among the pepper, lemon, and orange trees I saw them digging like furies. Hoping they would have their trouble for nothing, I rode farther down. Beneath me I saw the stream, and some monks getting in the hay. The high wall of the garden soon came to an end, and then there was a low one.

Suddenly, behind this wall, we saw four crouching figures hurrying along as fast as they could, carrying something that was very heavy. Behind them was another monk with some long rods in his hands. Their evident haste and their mysterious movements excited our attention at once, and, dismounting, we took our horses a little back among the vines. Soon they came to a coppice, and there I thought they might stop; but they did not. On issuing from it, no longer sheltered, they ran towards the river as fast as they could with their burden—a long chest with rings at the side for the poles. They placed it carefully among some bulrushes, and then they separated along the river-bank.

With a chuckle of delight, all the more hearty when I thought of the dragoons digging and sweating in the garden, I sent one of the men to order the carts to go right back and come along the road by the bridge, and then with the other two I rode carefully down the hill. On the banks of the stream, at various distances, the monks were quietly fishing.

'Good-morning, father,' I said to the first.

'*Pax vobiscum*, my son!' he answered.

'Have you had any luck?'

'Not yet,' he answered, drawing his line out of the water for another throw.

'Perhaps you might do better,' I said, 'if you were to put some bait on your hook.'

He looked at me with a scowl, but said nothing.

Passing the others, I made straight for the bulrushes. A handsome young fellow, who proved to be what they call the vicar, looked at me uneasily.

'I am sorry to interrupt your simple pursuits,' I said; 'but I want to look into those bulrushes,' at the same time ordering the men to dismount; and quickly the heavy chest was on the bank.

Seeing resistance was impossible, the monk told me that he would unlock it; and, lo and behold! there was the far-famed silver statue, almost life-size; and not only that, but several reliquaries and monstrosities, these latter of silver gilt, and a solid gold chalice studded with gems.

Such luck, when we had thought the dragoons had got everything, almost took our breath away.

'I want to speak to you,' said the vicar, draw-

ing me aside. 'Look here,' he continued in a low voice, 'that statue is only silver; when melted it won't fetch six thousand pesetas. The statue and all the other things, including the jewels, are not worth more than thirty thousand francs to you. I swear I will give you forty thousand francs in gold and silver coin.'

Naturally I hesitated. I did not understand why he should, and I told him so.

'Because,' he answered, 'thousands of pilgrims come yearly to touch the statue and to kiss the relics. If you take that statue it will be impossible for us in these troublous times to get another before the pilgrims come on the 4th of October. It has to be modelled in wax first, and then made from that in silver. We have suffered severely of late years from another Brotherhood a few leagues off, and they would let all the world know that we had lost our wonderful statue, and our revenue would decrease more than ever.'

But still I hesitated.

'Look here,' he said, 'I will give you a bill for yourself, drawn on a banker at Alicante, for ten thousand pesetas if you will agree.'

Now I did not for one moment mean to keep this for myself—it would have been dishonourable both to the officers and my comrades; but when it came to getting fifty thousand pesetas for what was only worth thirty thousand, I could not resist, and I agreed.

'All right,' he said. 'Now you and I will go up to the monastery, and when those wicked thieves have gone you shall have the money.'

(Continued in following section of this part.)

ROMAN MEMORIES.

By HERBERT W. TOMPKINS, F.R.Hist.S.

ROME'S sky was 'deeply, darkly, beautifully blue' as I looked from the window of my hotel in the Via Cavour, near the Baths of Diocletian. Was this Rome? Swifts were wheeling hither and thither as erratically, and were screeching as loudly, as they do in Old England, a thousand miles away as the crow flies. Men and women passed to and fro in mere mercenary mood. As I paused on the hotel steps a street hawker, vending a cheap *guida*, addressed me in pidgin-English worthy of Li Chang Wo. At length, after years of hope deferred, I was in that city which, as Mr Frederic Harrison has said, is the true microcosm wherein the vast panorama of history is reflected as in a mirror.

The air was sweet and keen as I turned into the Via delle Quattro Fontane. I passed the Palazzo Barberini, built, it is believed, by Urban the Eighth of stones from the Flavian Amphitheatre; whence the oft-cited pasquinade alleging that the Barberini had done what the barbarians

had not. Then, reaching the Via Sistina, I looked back, and, seeing the basilica of Santa Maria Maggiore crowning the Esquiline, I realised that I was in Rome, for her fascination was upon me. The *scala* from the Church of SS. Trinità de' Monti led me to the Piazza di Spagna—the chief resort of the flower-girls of Rome; there, close to the barque fountain of Bernini, stands the house where Keats died in 1821. I remembered how the poet had been saddened by Alfieri's lines:

Misera me! sollievo a me non resta
Altro che 'l pianto, ed il pianto e delitto;

and how, like Paolo and Francesca, but for a very different reason, he closed his book and read no more. To the Piazza di Spagna Smollett drove after the *servitori* had taken possession of his coach; in that piazza Macaulay saw more coroneted carriages than in St James's parish. Conflicting stories are told of houses hereabouts where artists lived and died. According to

several authorities, when you stand where the *Via Sistina* and *Via Gregoriana* unite you may lay your hand on the house in which Poussin breathed his last; a few doors off lived Salvator Rosa, nearly opposite the house of Claude. But Mr Edward Dillon, who should know something of these matters, says that Poussin and Claude both lived in the *Via Paolina*, now better known as the *Via Babuino*, which runs from the *Piazza di Spagna* to the *Piazza del Popolo*. He adds that, as Bellori records, it was Poussin's daily habit to mount the steps to the *Trinità* on his way to the Pincian.

I retraced my steps and came out upon the Pincian Hill, where Keats was wont to stroll with Severn, and where he was so much agitated by the charms of the Princess Borghese, then a famous beauty, that he altered his walk to avoid her. On my left lay the *Piazza del Popolo*; on my right the Gardens and *Villa Borghese*, dark with ilex and stone-pine—the stone-pine so dear to Claude and Turner. I had passed near what were once the Gardens of Lucullus; beyond rose the Flaminian Gate, the *Porta del Popolo*. I did what thousands had done before me—week after week, year after year, century after century—I leaned upon the balustrade overlooking the piazza, and saw for the first time the gray dome of St Peter's. Behind me, beneath the ilexes, priests chatted or read their breviaries; before me, descending terraces set about with graceful statues conducted the eye to the obelisk of red granite that rears its hundred feet from the centre of the piazza. That obelisk is older than any object beneath it. It is coeval with the earlier papyrus of Egypt. It was first raised before the days of Rameses the Second to adorn the Temple of the Sun at Heliopolis. It was brought to Rome after the victory of Actium, and erected in the Circus Maximus. There, after many years, it fell from its pedestal, and was not set up in the *Piazza del Popolo* until the pontificate of Sixtus the Fifth.

Byron was right when he told Moore that Rome must be seen. Moreover, knowing both Greece and Italy better than most men, he expressed the opinion that Rome contains more objects of interest than the whole of Greece. The aggregate is too large for any single comprehension.

Thou seeest not all, but piecemeal thou must break To separate contemplation the great whole.

For it is a truism that there are many Romes, legendary and actual, and that all are worthy of study. There is the Rome founded seven and a half centuries before the birth of Christ by those few shepherds who built huts on the hill sacred to Pales, protectress of flocks; a Rome of which we catch vague glimpses through the twilight of antiquity and the mists of myth. There is the Rome of Numa Pompilius, with its pontiffs, its augurs, its flamens, its vestal virgins who tended the sacred fire of Vesta as the priests tended

the sacred shields, one of which was fabled to have fallen from heaven. There is the Rome of Tarquin and of Servius, with its vexed politics, its Sibylline books, its consultations at Delphi, its Lucretia spinning amid her maidens, its Sextus that wrought the deed of shame. There is the Rome of the early Republic, with its consuls, its Etruscan wars, its patrician and plebeian, its Porsena, its Scævola, its Coriolanus. There is the Rome of the Decemvirate, with its ten tables and its twelve tables, its embassy to Greece, its Tribunes, its Appius Claudius, its Valerian right of appeal. There is the Rome of the three Samnite wars, when the city was threatened by Samnite and Etruscan and Umbrian. There is the Rome of Punic and Macedonian and Syrian wars, the Rome of Flaminius and Hannibal, the Rome of Cato and of Scipio.

And all this is but the beginning. One chapter opens with the Gracchi, another with Jugurtha, another with Sulla, another with Cæsar. There is the age of Cicero, which brings before us Catiline ('How long, O Catiline, will you abuse our patience?') and Verres and Clodius and Milo; the speeches, the Epistles to Atticus (the studied prose of that writer whose style was the despair of every Latinist in Europe for fifteen hundred years), the second triumvirate, the rise of Antony, the death of Cicero in the woods about Cajeta. There is the Rome of the poets, of Horace and Virgil and Ovid and Juvenal; the Rome of the Annalists, of Sallust and Livy and Nepos and Tacitus and Suetonius, and how many others! The latest of them all has slept for eighteen hundred years where battle-thunders cannot break his rest. The Rome in which he lived and loved and hated is a city to-day, however mutilated and fragmentary, as it was for many centuries before he trod its streets.

I found it still possible to see Rome. Time, warfare, renovators have done their worst; but so vast a wreckage cannot readily be blotted from the eye of man. Loitering in the Corso and the *Via Nazionale*, I might have supposed myself in Cheapside or Piccadilly; but the man or woman who stares into shop-windows is not looking at Rome. You must pry into nooks and corners; you must observe mean men and unsavoury places. Above all, you must choose some elevation from which to survey the whole—say the Janiculum or the Pincian. This to commence; the 'separate contemplation' will come afterwards.

I might take it for granted that everybody has read Gibbon. But possibly everybody has not; so I will cite the four causes named by him as contributing to the ruin of Rome: the injuries of time and nature, attacks of barbarians and Christians, use and abuse of materials, domestic quarrels of the Romans. Poggio of Terranova, five centuries back, chose the Capitoline Hill from which to survey the city. He lamented

the ravage wrought among her palaces and baths, her statues and obelisks, and wrote an account of much that remained in his day. Every historian and topographer, from Poggio to Lanciani, has noted the progress of this work of destruction. Every boy has been told that Rome was not built in a day; it is still more important to insist that centuries have failed to destroy her. One is sometimes led to suppose her eternal, a something which no power on earth can 'utterly abolish or destroy.'

Consider. She laid the world under tribute. She was enriched from every quarry. Each marble known to man for its peculiar beauty was hewn for her colonnades, her baths, her temples, her statues, her fountains. Miles of stupendous aqueduct brought her water from the roots of the Apennines. A thousand vineyards, from Palestine to the Pillars of Hercules, yielded her wine. Half the known world sent her slaves. The loveliest and haughtiest women brought their virtues and vices into her public and private resorts. Cunning craftsmen from every clime helped to adorn her

With gilded battlements, conspicuous far,
Turrets and terraces and glittering spires, . . .
Carved work, the hand of famed artificers
In cedar, marble, ivory, or gold.

Much is taken, much remains; but the residue is wreckage. A few gaunt arches, set about with cypress, represent the Palace of the Cæsars; the Colosseum is reduced to one-third; the Claudian Aqueduct stretches one-tenth of its original mass across the deserted Campagna; the Baths of Caracalla, ninety years back, were a ruin-heap covered with weeds and flowers, which drew from Shelley the exclamation, 'Never was any desolation more sublime and lovely.' The Baths of Diocletian have become the Museo Nazionale Romano.

Renan deemed Rome a heap of ruins, but knew well that she is greater than the materials of which she was made; unless, indeed, we take deeper interest in the *cloaca maxima* than in Sallust, or value the potsherds of Monte Testaccio above the marbles of the Vatican.

I could not see the Tiber itself from the Pincian Hill. But before me rose the Castle of St Angelo, topped by the figure of an angel which is perhaps the sixth that has occupied the position since one was first placed there, as the story runs, by Gregory the Great, who had seen a vision of Michael sheathing his sword above the mausoleum. The Castle of St Angelo has superseded the Mausoleum of Hadrian, as the Ponte St Angelo has superseded the Pons Ælius, portions of which are built into the present bridge. Hadrian died on 10th July 138 A.D. His body was ceremoniously burned by Antoninus in Cicero's villa at Puteoli; his ashes were deposited in the mausoleum which he had himself prepared. There, in turn, each emperor and his family were laid, from Hadrian to Caracalla. Later, when

the tides of life had ebbed and flowed until Imperial Rome was but a memory, the Mausoleum of Hadrian, deprived of its columns and statues, became that Castle of St Angelo which was long the prison or stronghold of Popes in their days of trouble. There John the Thirteenth was imprisoned by the Romans before his banishment to Capua. There Benedict the Sixth was strangled or starved by that potent citizen who thereupon became Boniface the Seventh. There John the Fourteenth was murdered by braves at the instigation of Boniface, who had fled to Constantinople soon after his accession, taking with him ill-gotten gains. There the Anti-Pope Cadalus was thrust for safety by Cincius until, having bribed his besiegers with three hundred pounds in silver, he escaped 'on a lean horse.' In that castle Gregory the Seventh maintained a stout defence against his enemies; there, on another occasion, he was found by the friendly Guiscard, who had forced the Porto del Popolo with a numerous army. Boniface the Ninth, the first to invest all the power of Rome in its Pope, fortified the castle with walls and turrets, and set guards on each bridge that spanned the Tiber. His work was well done, for when the castle was assaulted by John Colonna he failed to take possession of it. In the days of John the Twenty-third came Braccio Montone, who also tried to storm this fortress; but it was defended by the stalwarts of Queen Joanna, and on the arrival of Sforza, the queen's general, Montone and his men were beaten off.

Then came days when the entire neighbourhood was in a sorry state. The times were turbulent; churches and houses lay in ruins; the filth of the streets was malodorous; the city was infested by robbers and vagabonds. On St Andrew's Eve, 1422, the Tiber rose, as so often before, flowed in at the Porta del Popolo, and flooded the city so deeply that men went about their business or their villainies in boats, and the Castle of St Angelo was more effectively isolated than its inmates desired. To continue this chronicle would be to think of Benvenuto Cellini, a man whose character it is difficult to estimate at its true worth; of Joseph Balsamo, *alias* Count Cagliostro, whom it is still more difficult to estimate at his true worthlessness; and of Beatrice Cenci, whose story, tragic and repulsive at best, has been overlaid with a mass of legend still more horrible. Her father, Francesco, a man so wholly wicked, has been compared by the late F. Marion Crawford with Tiberius, with Nero, and with Commodus.

At the foot of the Pincian Hill, near the Flaminian Gate, I entered the Church of St Maria del Popolo. No spot more aptly illustrates Rome's Pagan and Christian duality than that occupied by this church. It supported the tomb of the Domitii; it supports a Christian sanctuary. It was long haunted by the spirit of Nero; it is sacred to the name of Mary. Many a traveller passing out of Rome by the Via Cassia has been

shown a sarcophagus called the Tomb of Nero, about four and a half miles from the city. It is in no way connected with Nero. It was erected by a Roman woman named Vibia Maria Maxima to the memory of her father and mother. It is here, rather, at the foot of the Pincian Hill—here, in the silence of this Christian sanctuary—that we recall the death and memory of Nero.

There came a time, early in the June of 68 A.D., when the crimes of Nero could no longer be borne. He was hated, feared, despised; even the Pretorian Guard was suspected of treachery. Galba was at hand. The powers of darkness lent their aid to scare the tyrant; the gates of the Mausoleum of Augustus opened of themselves and a voice called the name of Nero. Then the emperor arose from his couch, flung aside his crystal cups, and prepared to fly. He presently sought shelter in the villa of his freedman Phaon. There the autocrat who had held revel in his Golden House—that stretched from the Palatine to the Esquiline, adorned with precious stones and enriched with the masterpieces of Grecian art—flung himself on a filthy bed and gave way to despair. There he heard that Galba had been declared emperor, and that the Senate had decreed his destruction. On the approach of the soldiers sent to carry him to execution, Nero summoned up courage to commit suicide. Near by, a grave had been dug by his orders; in that the body was placed and there burned. The ashes were wrapped in costly material, and laid by two nurses and his favourite mistress in the tomb of the Domitii. God had granted him great abilities; he had been instructed by Seneca; he had enjoyed honorary membership of the colleges of the priests. He was a supreme example of the man who sins against light. *Video meliora proboque, deteriora sequor.*

Time passed. Legends gathered around the tomb of Nero. The spot became shaded by a huge walnut-tree, and the tree was infested by multitudes of crows that pillaged the neighbourhood and defied dislodgment. At length Pascal the Second was told by the Virgin that these crows were demons haunted by the spirit of Nero. Moreover, the Virgin ordered him to cut down the tree, burn it, and erect upon the spot a church dedicated to herself. The church was built, and was called St Maria del Popolo, because it was erected at the expense of the common people.

Rome is a manual of history; she is filled with 'portions and parcels of the dreadful past.' Her ruins help us to reconstruct that past, as the biologist reconstructs a primeval monster from a few stray bones. We can walk around the walls of the Eternal City; we can tell her towers; we can sit where Roman women sat as they watched the gladiator die; we can look upon vessels of domestic utility fashioned in the days of Horace; we can handle coins dispersed by the gambler or hoarded by the miser when Seneca, with two millions sterling at usury, meditated 'epigrammatic conceits about the evils of luxury in gardens

which moved the envy of sovereigns.' Rome retains in her structures, her collections, her yet unclassified treasures, objects which speak with no uncertain voice of human life in each century that has elapsed since she was first mistress of the world, two thousand years ago.

Such reflections were mine when I visited the Museo Nazionale Romano, on the site of the Baths of Diocletian. Adjoining is the Church of St Maria degli Angeli, where, in the small rotunda first entered by visitors, lies the dust of Salvator Rosa. In that Museo the *disiecta membra* of Roman history are gathered together in several small rooms, or are placed in bewildering profusion on the walls of the Carthusian cloisters. Here are more than fifty thousand coins, many monumental inscriptions, marbles from the villa of Nero at Subiaco and from that of Hadrian at Tivoli, reliefs from sarcophagi, fragments and curios from a thousand homes, and busts of emperors and empresses. The whole is even as the fragments of some rich mosaic—fragments which, placed in correct juxtaposition, form one coherent picture of the past.

Perhaps the most elaborate panel from a sculptured sarcophagus is one among the Ludovisi collection. It depicts a battle-scene of the third century, where equestrian and pedestrian warriors are inextricably mingled. Some are prostrate beneath horses; others are struggling to free themselves from the press. The sculpture would be of great worth, in the absence of written records, as showing the dress and arms of the Roman soldiery. The whole is deeply relieved; and, although the subject is dissimilar, it reminded me of a woodcut in my possession, a crude representation of Michelangelo's cartoon depicting a number of infantry surprised when bathing on the banks of the Arno. Two sculptures assigned to the fifth century, a naked and a draped Aphrodite, must have looked exquisite when fresh from the chisel—

Before decay's defacing fingers

Had swept the lines where beauty lingers.

The naked Aphrodite reclines on a cushion, on a sloping seat of stone, and is playing on a double pipe. The hair is brushed carefully over the ears and gathered into a *reticulum*; the right leg is crossed over the left. The limbs are more fully rounded than is sometimes the case with sculptured women.

Among the marbles are some extreme types of Roman portraiture. A charioteer (*auriga*) of the first century has the broad, firm mouth and chin of one nerved to restrain and control. There is a suggestion of pause in the pose of the head, as though the charioteer had just reined up his *quadriga* and was expectant of some sign of command. A head of Antoninus Pius corresponds with what we know of his character; it is that of a man of simple tastes, whose life was summed up in the last word he uttered when the tribune of the night-watch asked the password

—*Æquanimitas*. In striking contrast is the head of a pugilist, whose features have been as much defaced by time as they were in real life by the fists of his antagonists; and the head of Lucilla, of infamous renown, with sensuous mouth and staring, fatuous eyes, the head of one who frizzled her hair with hot irons (*coma calami-strata*), and anointed it with the richest perfumes; who was incapable of self-restraint and unable to control others, and whose world (*mundus muliebris*) consisted solely of frivolous pleasures and domestic intrigues. Far different is the fully draped figure of a vestal of dignified mien, and an Apollo, with lyre, whose hair lies gracefully about his shoulders. There is a wonderful air of abstraction brooding over this marble, as though Apollo were pondering some melodious utterance that should 'give resounding grace to all heaven's harmonies.'

The treasures of the Museo Nazionale Romano, first opened to the public in 1889, are but a fraction of those preserved in Rome. Moreover, excavations are still proceeding, slowly but surely, and light has been thrown on many obscure points of history. Objects of interest are found daily, and the common folk are aware that such objects are of monetary value. Ancient roadways have been traced; drainage systems have been laid bare; walls have had their limits exposed; inscriptions have been pieced together and deciphered; mosaics have been freed from the débris which covered them. Only two roads in ancient Rome were termed *Via*—the *Via Sacra* and the *Via Nova*. The pavement of the latter has recently been uncovered, exposing to view the road constructed, according to tradition, by Servius Tullius as an approach to the Palatine from the northern slope of the *mons*. What is of greater interest, it is now known that the *Via Nova* was a covered way, being in fact a prolonged *porticus*. Other thoroughfares are known to have led from the *Via Nova* to the Palatine. It is hoped that these may in turn be exposed, and thus enable us to improve our maps of the city.

The recent uncovering of augural remains, such as the deposit under the equestrian statue of Domitian, comprising five archaic vases, one of which contained particles of pine-resin, gold-ore, and tortoise-shell, has revived the hope that our knowledge of augural ceremonies may be

extended indefinitely. Thus the aspirations of the archæologist are architectonic in regard to religion also. He hopes to rehabilitate the ritual of the past, to surprise the priest in the celebration of the mysteries, and—if I may put it thus—to 'affright the flamens at their service quaint.' The Romish or Eastern or Anglican priest usually thinks but little of the origin of the manual acts, or of orientation, or of genuflection before altars. This is as it should be. He thinks, and thinks rightly, that ritual is sanctified by the occasion and purpose of its exercise, and is pregnant with divine significance from whatsoever source we may have derived it. It is remarkable that the Roman augur or flamen or pontiff seems to have stood in much the same position. The rites and ceremonies which he observed and practised were themselves survivals of earlier ritual known in the East and in Egypt long before the consecration by Horatius of Tarquin's temple on the Capitoline Hill or the foundation of the colleges of the priests. It is probable that the origin of much religious ritual was lost at a very early period, and that the priest exercised his functions automatically, without knowing the why or the wherefore. As a living critic has put it, 'modern methods of comparative analysis may enable the student of to-day to see into and understand many ceremonies which even to the ancients who performed them were often veritable *arcana*.'

Men who dig and delve may reconstruct for us here, as they have reconstructed the private apartments of the Roman matron or virgin, the domestic offices of the palace, the details of the villa and of the bath. The study of Roman antiquities is no longer the amusement of dilettanti, but the life-work of a Boni or a Lanciani. To Lanciani we owe a conjectural restoration of the Temple of Vesta as rebuilt by Severus, that temple which held the sacred fire and the relics, and was therefore the most revered of Roman edifices. The plausibility of that restoration is largely due to the fact that this temple is depicted on coins of Domitian, and on medals of Faustina senior, Lucilla, and others. Moreover, fragments of the temple itself were found by the ruined *podium*. Thus, having material to handle and representations to pore upon, Lanciani was enabled to reconstruct the whole with a *vérité* which few can dispute.

THE SHIP OF SHADOWS.

By JOHN FOSTER, Author of *The Bernardino*, *The Forgotten Rock*, &c.

CHAPTER VIII.—THE TERTIUM QUID.

'NEXT morning there was a bit of a sea on, with bundles of clouds scurrying all over the lift, and a freshening wind. *The Berwick Law*, I soon discovered, was only a middling good vessel in heavy weather. When I came on

deck she was under double reef and running rather awild. The youngster Callender was spinning away at the wheel, and the mate was in charge, for it appeared that the captain had strained a sinew and was keeping to his cabin.

The schooner was behaving badly, shipping water, and at one time we thought that we should have to balance reef. However, by evening the wind fell. I confess I wasn't sorry, for I knew the sailors' doggerel about the hurricane visits in these parts:

June—too soon!
July—stand by!
August—you must!
September—remember!
October—all over!

'Well, this was in the end of May, and we weren't into the hurricane belt by any means, much less out of it.

'I had done a hard spell of work that day, and, being soft from loafing round Trinidad, I was dead-tired. Truth to tell, I was feeling rather queer. It was just after sundown, and I thought of making for my berth. *The Berwick* still rolled a bit, a dash of spray swishing over her bows now and then as she dipped; but the big gray walls of sea gradually slanted and were losing their height as I sat down on a coil of rope amidships to have a smoke before turning in. There was no sound except the rhythmic plunge of the schooner, the *pest* / of the sea on her bows; the wind whistling through the rigging, and Evan's voice humming, "*Ho rò, mo nighan donn, bhòidheach!*" The night was fairly clear, though there were some clouds about. The place where I sat was in the middle of a pool of shadows from the galley. I watched the luff of the sails idly, thinking of home and a hundred other things, until, I suppose, I must have fallen asleep. I remember wondering whether I was afloat or ashore, for suddenly I became aware that a woman was standing under the lee of the companion.

'I rubbed my eyes. Then I remembered. It was the skipper's wife. Of course I had forgotten her. I told you that she had been ill, and had kept below. Well, here she was on deck.

'Now, I have—I had—an eye for a pretty woman, and there was no denying her beauty. She was the stuff that dreams are made of! Fair to see, a little slip of a woman, quite young, with a girlish charm, pale and sweet as a wild white rose. This poor old hulk—he laid a hand on the wreck—'was christened after her. She did not see me in the dark shadow as I lay looking at the lines of her dainty figure, and her fair hair dancing in the wind round her pretty face. Far too slight and fragile to rough it and chance the luck of the sea on a little fore-and-after. There she stood, holding on to the rail, quite still but for the plunge and lift of the ship, and in evident enjoyment of the breeze of the evening, her lips parted in a smile, her face in a radiance of happiness.

'As I looked at her a strange and disquieting thing came about. I thought I heard a soft footstep, and the next instant saw the man

Lowden within a few yards of her. I nearly got to my feet, for I had doubts of the man's sanity; but she had turned at the sound, and I saw that the two were not strangers to each other. Although they were standing in the broken light, I saw both their faces as plainly as I see yours. The man's eyes met hers. Into her face came a change swift, indescribable, and unnerving. I thought of a bird and a snake. But fear and amazement showed but for an instant. She neither screamed nor fainted. I slipped farther into the shadows. She looked quickly, stealthily round. There was no one visible.

"You!" she said in a whisper, and her voice belied her look of the moment before. It was soft and winning. For a moment he stood, his throat working, and then held out his hands. "Madge, I followed you!"

"I caught these words only among others. He stood facing her, both white to the lips; and, as I looked, the image of the bird and the snake left me, for his eyes on hers were like a dog on its owner's.

"Hush, hush!" she said, and again gave a swift glance all round. I stopped breathing, I think, in my anxiety to hear. "My—you must know—my—husband."

"I know. I learned soon enough, God knows!" came from him bitterly.

"You misjudge me. Every one did. Circumstances—everything—went awry." She spoke rapidly, breathlessly again in a whisper, and I could pick up mere fragments of the talk only. I remember hearing the skipper's name "Gerrand" once or twice, and at last the words, "You followed us," from the woman. Lowden winced. "Followed you. To be near you; to see you every day; to hear your voice. To do murder, Madge, if you ask me!"

'She looked keenly, searchingly at him. "Listen! Promise me! He—my husband—he does not, must not—know who you are!" She came a step nearer him.

"Have no fears. No one shall know who I am, or that I so much as know you."

"You swear that—swear it, if—if you love me. Quick! I cannot wait here," she whispered eagerly, but with her voice under control. Then she held out her hand. Lowden seized it and kissed it passionately.

"I swear," he said. She looked round for a moment. "Now go," she said. "If we are seen"—And Lowden went swiftly forward.

'The woman stood for a moment looking after him. Her eyes fell on the hand that he had kissed. She brushed it angrily as if to scour the memory of his touch from it, then turned and disappeared down the companion.

"*A-l-l's well,*" sang the lookout forward.

'Blame me if you like for watching the pair that evening. I don't know whether I ought to have declared my presence; but indeed the affair

came about so suddenly, I was so caught up in a mist of perplexity and curiosity, and the whole scene passed so quickly that I lay still where I was, dumb with astonishment.

'I waited for a few moments, but all was quiet, and I turned in to try to sleep. In ordinary circumstances I don't think that I should have closed an eye, for my wits were beginning to busy themselves suggesting and discarding solutions of what I had witnessed. But I was dog-tired, feeling very queer and "shivery," and fell asleep, to waken in a lather of sweat after horrid dreams.

'I had half a mind to go up and challenge Lowden about the scene in the first watch, but second thoughts prevailed. I don't know that I was right; but it was little or none of my business, and it might have required but a hint to set him ablaze. I was young, but old enough to know the futility of acting without knowledge. The triangle, the two men, the one woman, was nearly as old as the world, I reflected. So I lay low and awaited developments. After all, I knew nothing of the rights or wrongs of the affair. Lowden, although a dour shipmate, might have been in the right. But I remembered also the woman's face and gesture when she looked at her hand, and I knew, whatever had happened, that she wasn't wronging her husband.

'However, these cogitations were hustled out of my mind for a time, for ill-luck, in the shape of a sharp dose of fever laid me on my back, and there I lay stretched in my bunk feeling very limp, and wishing with all my heart that I could get a glimpse of Old Scotland once more. Evan came often and sat with me, smelling dreadfully of rum, it is true, but doing much to kill the dull hours and hasten my convalescence with his talk and his company. But it was some time ere I was fit to come on deck and feel the grateful fresh breeze again. We had been lucky in meeting no hurricanes, and *The Berwick Law* had passed

the Bermudas, was out of the Trades, and catching the west winds. The air was cold o' nights, and getting colder every passing of the twenty-four hours. But I gained strength, thanks to youth and a tough frame, and was soon myself again, well content to learn that we were within four or five days of Newf'un'land. There I hoped to get a passage on some homeward-bound ship, for Captain Gerrand owned as well as sailed *The Berwick Law*, and it was by no means certain that her next port of call after St John's would be in the homeland.

'After thinking it over I decided to tell Evan what I had seen happen between Lowden and the skipper's wife. He listened to the end. "I'm no' fer interferin'," he summed up at once. "It's little thanks we'd get from any wan o' them. Women are mostly mad—at least the wans that I've courted. The lass will manage her own affairs without let or hindrance from us, I'm thinkin'. An' it's other folk's pusiness. I'm the ship's cook, an' it's a notion I'm havin' o' stickin' to my job, an' leavin' detective work alone. An' more, there's a look in Lowden's eye that I've no use for. Meddle wi' him, an' ye might pe gettin' a knife in yer ribs."

'We kept our eyes warily about us, you may be sure. The man Lowden went about his work doggedly. His eye was brighter and the set of his shoulders younger; but he had not lost the trick of muttering to himself. Once or twice I thought that he might have been taking too long a pull at the main sheet, but I was wrong. The man was as sober as I was. And he kept his secret, never so much as letting his eyes turn after her when the skipper's wife was on deck, but moiling away, and I'm bound to say doing two men's work.

'Then came a night that altered the course of *The Berwick Law* and the chart of all the lives on her.'

(Continued in following section of this part.)

DARK STARS.

By H. F. HORSNAILL.

POSSIBLY it has never occurred to many people that there are such bodies as dark stars; but so great an authority as Sir Robert Ball has said that the dark stars are to the bright for numbers as the cold horseshoes in existence are to the red-hot ones. In these days of motor vehicles it is evident that horseshoes are less numerous than they were; but doubtless the proportion of cold ones to those at any given moment red upon the blacksmith's anvil remains much as it always was. For every such hot one there must be many hundreds of cold ones; so that if the simile is sound, the heavens must contain an incredible number of these derelicts on the ocean of space, which, having lived their life,

have grown cold and dead, but are still racing about at star-speed until in their wanderings they shall meet some other heavenly body in terrific collision.

Such a gigantic catastrophe as the clash of two suns, each perhaps millions of miles in diameter, rushing at each other at the rate of twenty or thirty or even more miles per second would result, so the mathematicians tell us, in a world-splitting explosion, exactly as if each were composed of billions of billions of tons of gunpowder; and as when gunpowder explodes nothing is left but gas and smoke, so in the clash of stars nothing would be left of the two great solid bodies which had collided but an immense

whirling mass of incandescent gas called a nebula, of which, as most people know, there are quite a number dotted over the heavens. This maelstrom of gas would sail about among the stars for ages, in the course of which it would gradually cool down and condense into a star-system much like our own, with probably a central sun, planets, and moons.

Some of these would sooner or later arrive at a condition of temperature suitable for the support of life, and as the centuries passed would become peopled with sentient beings. Gradually they would grow too cold for life to exist, and finally become frigid, dead, dark stars once more. The number of stars visible to the naked eye is only a few thousands. With the best telescopic and other instruments it is calculated we can detect about a hundred millions—not a large number (there are fifteen times as many people as that living on this globe); but, judging by Sir Robert Ball's horseshoe simile, and reckoning only one hundred dark ones to every bright one, we may take it that there must be at least ten thousand million dark stars chasing about in space, most of which we have never seen and probably never will see.

I say most of which, for perhaps it may come as a surprise to some that the earth we live in is a dark star; so are all the other planets and planetoids of our solar system, with their moons, of which bodies, shining only by the reflected light of the sun, there are at least six hundred known to astronomers. Nor must we forget to mention those bodies called shooting stars which may be seen almost any clear night if patiently watched for. These, though they look like stars, are hardly, as every one knows, to be dignified by the name, being mostly but very small masses of matter flying about in space. They are quite cold and dark until they enter our atmosphere, which they do at such a speed as raises them at once to a white-heat by friction of their passage through it, and thus they are revealed to us. For every one we see there must be many thousands whose paths miss us entirely, ships that pass in the night, silently and unknown. These, too, we must class as dark stars, though very humble ones. All these are cold and dead compared with our sun or any of the stars we see. From the nearest they would be quite invisible; and, *vice versa*, we cannot see the planets which revolve round the stars, if such there be, as is likely enough; for it is hardly to be supposed that our sun alone, among a hundred million others, possesses such attendants.

But we have one or two other reasons for thinking that there are dark stars much larger than any of these. Here and there are bright ones which are found to vary in magnitude at regular intervals. One, Algol in Perseus, not far from Cassiopeia, varies every three days from a star of the second magnitude to one of the third, and gives us only one-third as much light

at its dullest as it does at its brightest. It seems probable that Algol is really two stars revolving about each other much as the two ends of a dumb-bell would revolve were it set spinning. One of these is supposed to be dark and cold, or comparatively so, and the other bright; it is easy to see how at each revolution the dark one might come between us and its brighter companion, and cut off part of the light, thus causing the changes we see.

About thirty of these variables have been discovered. It seems a small number, but it is plain enough that for one of such a pair to eclipse the other its path would have to lie exactly between us and its partner. Probably there are many whose paths do not fulfil this condition, and therefore cause no variation of light coming to us. Others are doubtless flying about the heavens on haphazard paths, and it is conceivable that one might come along and collide with us or our sun. The result of such a collision would undoubtedly be the end of this earth and its inhabitants.

If the intruder were of any respectable size, a collision with any of the larger members of the solar system would produce such a conflagration as would raise the temperature of all the rest above the point at which life as we know it could exist. 'The earth and all the inhabitants thereof would be burnt up, and the elements would melt with fervent heat.' Even if such a star did not collide, but merely passed through our system, the effect of its attraction would altogether upset present conditions, and almost certainly bring about the cessation of life on the earth.

Neither can we encourage ourselves with the hope that the collision would be too sudden for us to know much about it. No such thing. Our astronomers would see the star directly it got near enough for the sun to light it up, probably fifteen or twenty years before it arrived, according to its size and speed. They would be able to calculate its path and foretell to a few minutes the precise moment of the catastrophe, and we should have the added horror of the anticipation of our slowly advancing doom. Indeed, the passage of even a small star quite outside our system by many millions of miles would still have a sufficiently disturbing effect on us to draw us out of our path and alter entirely our climate and temperature.

The organic life of our globe requires for its continuance a temperature range of about one hundred degrees Fahrenheit, an exceedingly narrow one when we consider the possible range of heat and cold. Outside of this nothing can live and grow, and it is one of the marvels of creation that the earth has for many millions of years maintained an average temperature over some part of its surface within this limit, and goes far to prove the existence of a mighty Mind at the back of it all who planned it with infinite skill and foresight apparently for the very purpose of evolving the human race as we know it.

And who shall say to what heights of intellectual and moral perfection man is destined to climb? It may be that the end of all things is at hand, and that some one of these dark bodies is even now swinging along towards us from the depths of space; but seeing the many millions of years the solar system has continued in 'splendid

isolation,' we may take courage for the future, and believe that the Mind that has by unchangeable laws brought man to his present state will carry him on to such perfection as he may be capable of. Judging by appearances, this will take many æons yet, so let us sleep peacefully in our beds for the present.

A TIBETAN FAIR.

THE month of June at Gyantse is an idle and enjoyable one for the people. The crops are just bursting through the soil, and the plain is again assuming a green tinge after the long winter, at which season it is frozen and parched to a dry khaki-colour. The encircling hills, up which the cultivation attempts to spread wherever a stream affords means of irrigation, still retain their monotonous hue, as the grass, though sufficient to provide nourishment for the wild sheep, is so scanty that it is not visible in the distance; here and there, however, a spring surrounded with beautiful turf affords a much-needed spot of colour on the hillside.

These hills, rising at one point to a height of nearly seventeen thousand feet above the sea-level, and towering some three thousand eight hundred feet above the fields, form round the plain a barrier which is broken in three places by streams along which the three important roads from Lhassa, Shigatze, and India are carried.

The fields have been manured, ploughed, and sown, and the only work now required to be done is occasionally to water the crops from the irrigation channels which separate the fields. The cultivator's anxiety now is lest some neighbour, whilst carefully regulating the water in his own fields, should flood the adjacent crops excessively, and thus ruin them; and this is a fruitful source of lawsuits. But perhaps a hailstorm may devastate the fields, the precaution taken against such a calamity being to retain the services of a Hail Lama. This man's life is one of dignity and ease. If the crops are not injured he receives great kudos in addition to pecuniary rewards from the grateful people; while if, on the other hand, they are still damaged by hail, his reply to the aggrieved peasants is to this effect: 'Your sins are so appalling that even the intercession of such a holy man as myself could not secure more than a mitigation of your punishment. Had you not employed me the damage would have been far greater.' Pondering over this reply, they leave his presence. They continue to support him, and perhaps try to lead better lives; but if reformation proves impracticable, they may merely add a few more *manis* to their daily prayers.

I once spent some weeks in camp near the home of a Hail Lama who dwelt in a delightful

little cottage, like a doll's house, perched on the hillside, where he was waited on by an old woman. Inside it was a tiny temple containing an altar adorned with the usual images, butter-lamps, and vessels for holding holy water. He and his old housekeeper had cultivated a few square feet of the hillside, on which they attempted to grow vegetables, and which a covey of partridges used to frequent, running quite fearlessly around the house, evidently accustomed to the presence of its two harmless inhabitants. Here for many years this man had lived a peaceful, contented life, occasionally droning some prayers and beating a drum to scare off the hail devils. Sometimes he would commence his monotonous devotions at a very early hour in the morning; but he was always willing to postpone them to a later hour whenever I requested him to do so. These Hail Lamas belong to a sect who wear their hair in a queue in the same manner as the laymen, and do not shave their heads as do the ordinary monks.

The weather is now delightful, cool but not frosty at night, while the days are warm and sunny. It is at this season, after the labours of the spring have been completed, that the people engage in their annual sports. For several days beforehand great preparations have been made. Country-people may be met on the road, driving in donkeys or yaks laden with their tents and chattels. Ponies entered for the great race may be seen, each decorated as for a fair, and mounted by a small jockey whose distinguishing mark is a downy plume from the tail of the *lämmergeier* fixed on the top of his cap. Soon tents begin to appear, those in the centre of the camp being arranged in irregular lines, whilst others which are farther off straggle away on all sides wherever a piece of flat, uncultivated ground can be found. The tents of the richer folk are large calico erections ornamented with blue patterns, 'the soft, curled tendrils' of the swastika forming a favourite design. The poorer people pitch black tents, which are made of coarse yak-hair blanketting, and are wonderfully strong and weather-proof.

The first event on the card is the pony-race—the Gyantse 'Derby.' These strange people, whose theatrical plays last from morning to night for several days, conduct their races in a curious manner. The course is fifteen miles long, over

a typical road of the country, running alternately through heavy sand and over hard rocks where no one would dream of riding at all in other lands; and even the more level parts are littered with stones. The evening before the race the ponies are taken out to the starting-point, each mounted by the small boy who is to be his jockey. Before the first streak of dawn they are ready, and the official starter, a clerk of the two *jongpens*, who are the joint rulers of the district under the central Government, affixes a seal to the mane of each starter. This was found necessary because certain shady characters connected with the turf, who are not without their counterparts in other countries, were in the habit of providing a fresh pony for their own jockey at the half-distance, and in the dim morning light such a change might easily be effected without discovery. After the race the seals are examined, and if they are found correct the prizes are awarded. In a long race of this kind it is seldom that a close finish is witnessed. On one occasion, however, such a finish did occur, and the supporters of the second pony were so overcome by excitement that they rushed in a body, seized the prospective winner by the reins, and held on to him until their fancy had passed the post. The stewards spent many a thoughtful hour in considering to whom the stake should be awarded, each side bringing endless arguments in favour of its own contention.

Later in the morning another most interesting contest takes place. For this the Tibetan officials usually prepare a tent where the British officers are entertained with cakes and buttered tea. One requires a strong constitution to face a cup of this exhilarating beverage, the film of rancid butter on the surface of which grows thicker as the liquid cools; but after a long and cold day's travelling, when tired and hungry, I have actually been glad to partake of such uninviting refreshment, though this would seem incredible in the absence of unusually appetising conditions. For the shooting competition two targets are set up at one side of the course. The first is a small metal disc about six inches in diameter, along between two poles; and the second, a hundred yards farther on, is a triangular bag of straw about one foot in depth, hung in a similar way. The competitors are armed with a matchlock and a bow and arrows; each in turn gallops at full speed up the track, passing the targets at a distance of a couple of yards, and as he reaches the first target fires his matchlock, which is charged with powder only. If his aim has been true the disc is violently shaken, but in cases of doubt the judges subsequently examine it to see whether any grains of burnt powder are to be found on it. Immediately the gun has been discharged it is slung over the shoulder; the bow is then drawn out of its case with the left hand, and an arrow from the quiver with the right. The arrow is fitted to the string, and has to be

shot into the straw target. Great skill is required to accomplish this feat successfully; but a clever performer achieves the whole operation, from the firing of the musket to the discharge of the arrow, in one graceful motion. A great many competitors, however, fail to fit the notch of the arrow to the bowstring, and these, steering the pony close enough, throw or even push the arrow into the target. A clumsy competitor, but above all one whose pony does not go fast, is greeted with derisive jeers by the onlookers, who, forming an immense crowd, are seated all round the arena, with gaps behind the targets which appear to be too small for safety.

The women wear their curiously shaped jewelled head-dresses, and many carry scarlet sun-shades or less picturesque black umbrellas. In front of the crowd the police swagger about, each carrying a long stick and a short riding-whip, of which, to show their authority, they constantly make unnecessary use. The stewards, officials, and competitors are all dressed for the occasion in bright-coloured Chinese silks, and the horses are resplendent in their gala equipment of saddlery and ornaments.

After the completion of this competition a list of the successful performers is read out by one of the official clerks, who wear small, flat, yellow hats, and frequently carry a pen tucked under the hat, over the ear. It is quaint to see the rough yokel, whose daily life is spent in herding yaks and sheep, now decked out in his best silk clothes, which have been kept carefully for use on this one occasion in the year. He is very shy and nervous as he goes up to receive his prize of a silk scarf, and shows his respect for the clerk who hands it to him by putting out his tongue and scratching the back of his right ear.

We now return home to lunch, accompanied by a Tibetan friend who has brought a country cousin to see some of the white man's wonders. We show him the meteorological instruments. It takes him some time to realise that they are not intended to influence the weather; the mechanism of the anemometer he understands to some extent, as similar instruments are used in Tibet for repeating prayers. We then show him the telegraph and the telephone, and allow him to converse with his relative, who speaks from a room at the farther end of the building. Gramophones, typewriters, cameras, and everything in the catalogue of marvels must be shown. In my room he bows devoutly before a photograph of the Tashilama, and also before the large coloured portrait of the late King-Emperor, which impresses him greatly. As usual, the changing colour of a piece of photographic printing-paper placed in the sun produces consternation. One of our guests volunteers the opinion that a chimney is an ingenious device. Rumours of such inventions as bell-ropes had, however, reached his ears, and in his desire to show that he knows at least something of our ways he nearly tears down the hanging cord of

our electric bell. At lunch we are amused by an incident which would perhaps not cause a smile in a more conventional *ménage*. Our cuisine is of the simplest, our dishes consisting for the most part of game in various forms. In an attempt to render the meal more attractive, I had spent considerable time and patience in explaining to our *chef*, with the aid of the pictures in Mrs Beeton's masterpiece, how a roast hare should appear at table. On the cover being removed, imagine my surprise on seeing a couple of roast ducks sitting up on the dish, their heads facing me, with matches tucked under their wings to represent the skewers used for trussing the hare! In presence of our guests I show no surprise; but on observing my struggle to lay these stiff-necked birds on their backs, one of our friends quietly remarks that though my way of dressing ducks is doubtless the more artistic, he thinks that they are easier to tackle when cooked *à la tibétaine*. On departing, the country cousin has a request to make: will I give him a photograph? I naturally ask him what photograph he wishes, and he replies that the subject is immaterial, but that he would like a photograph of some kind to show to his friends.

The afternoon, when there are no organised competitions, is perhaps the most favourable time at which to study the people, who may then be seen amusing themselves according to their individual tastes. After lunch, therefore, we again walk over to the fair and take a stroll among the tents and booths. People of the better classes are seen sitting in their tents drinking tea and playing dominoes.

Many small shopkeepers, chiefly vendors of *chang* (Tibetan barley-beer), tea, and cakes, have brought their wares down, and are selling them in tents or under large red parasols. Numbers of men are engaged in archery, the arrows being fitted with wooden whistles instead of the usual sharp metal heads. This is a sport much favoured by Tibetan gentlemen. An erection of cloth on poles resembling a skittle-alley, about twenty yards long, is prepared, and at the end of this alley a small target about six inches across, with a bull's-eye of half that size, is hung by a rope. The target is so constructed that the bull's-eye will fall out if struck. The archers stand at the far end, having in front of them low tables which support their cups of *chang* and on which they place their stake, a *tanka* (a small silver coin equal to sixpence). The bowstring is not generally pulled with the fingers, but with a thick jade ring worn on the thumb, which is kept straight, the string being caught behind the ring and thus drawn. Now and then, at great personal risk, a boy will rush in to collect the arrows which are lying about and return them to their owners. These whistling arrows make the most monotonous sound; sometimes for days on end while sitting in my room I could hear their plaintive whistle resembling the call of a golden

plover, followed by a thump as the arrow struck the cloth behind the target; whistle—thump, whistle—thump, continuing incessantly for hours together.

We three officers spent a very pleasant afternoon in wandering among these fascinating scenes. Here we come upon a party picnicking on the ground among the sprouting iris, and drinking tea and *chang*. There are three women, a couple of laymen, and a monk in his rich claret-coloured dress, with the right arm bare to the shoulder; several boys and girls complete this party, and all are talking, laughing, and thoroughly enjoying themselves. Elsewhere some men and women have formed a circle, and are singing and dancing their weird national dance, keeping time to their voices by thumping their feet flat on the ground. At another place a crowd has collected, much like a crowd in other countries, those on the outside thrusting their way in, not knowing what they are trying to see, and doomed to be thoroughly disappointed when they do see it. In another quarter some children are kicking up a roughly made shuttlecock, their object being to keep it from falling to the ground. The little girls have entwined blue iris-flowers in their hair; and one of them, with a bent willow-wand and iris-blossoms to represent turquoises, has imitated the jewelled hoop which is worn on the head by Tibetan women. Here and there are ponies, some tethered, and others straying about cropping the fresh young grass. Dogs of various shapes and sizes surround us on all sides. Tied to the country-folk's tent-pegs and guarding the doors are large, fierce, shaggy Tibetan mastiffs who would make short work of any intruder; our doctor can tell many stories of wounds inflicted by them on passers-by when the dogs had been insecurely tied. Many of the people, rich and poor alike, are accompanied by some kind of toy-dog. These are for the most part underbred, short-haired, snappy animals, towards whom it is surprising what an amount of affection their masters show; but sometimes a more attractive animal may be seen, usually bearing some resemblance to a Pekingese. Dog-breeding as we understand it is unknown here, excepting in the case of well-bred mastiffs, with whom some care is exercised to eliminate the brown markings which are always to be seen on the ordinary tent-dwellers' guardians.

A party of Mongolians, dressed in thick quilted clothes, who have brought a drove of ponies for sale, form an interesting group. The faces of these men are tanned to a brick-red colour by the glare of the sun and by the icy winds which they have encountered on their many months' journey from their home. They have never seen a European before, and regard us and our clothes with the greatest curiosity, apparently expecting to see some remarkable result from our simplest actions. Some Nepalese and a few Chinese

traders are also to be seen. We notice some white-turbaned Kashmiri Mohammedans on their way to bring merchandise from India, who, like the Newari traders from Nepal, have adopted the Tibetan *chuba* or coat, but retain their national head-dress. Conspicuous also are groups of *sepoys* from the detachment of Indian troops stationed at Gyantse; they wander about in groups, as interested as their officers in the novel scene. At one point we are importuned by a gang of beggars. These are professional mendicants who are quite able to work, but have chosen begging as a more lucrative calling. They are dressed in the raggedest of clothes, and men, women, and children follow one about whining in a most heart-rending way. They do not, however, so much appeal to one's charitable feelings to extort alms as rely on wearing down one's patience by their monotonous wailing.

Many of the Tibetans are watching a game of football which the Indian soldiers have commenced; this greatly amuses the spectators, to whom the fall of a player causes rapturous delight. One gentleman displays his interest by asking me in all seriousness whether the ball is made of wood or of stone!

Presently we meet one of the representatives of the Lhasa Government, who appears glad to see us, and invites us to accompany him to his tent. This is pitched a little apart from the hubbub, in a delightfully peaceful grove of trees, which, according to prevailing custom, is adorned with votive rags and papers. Above us towers Gyantse Jong, which, after being for generations the chief fortress garrisoned by the Tibetan army, was captured by our troops in 1904.

We are introduced to our host's wife and her sister, and to his family of four boys and a girl. Her ladyship's head-dress is beautifully adorned with turquoise, coral, and seed-pearls, and two hundred sovereigns would not purchase the jewellery which she wears daily. We join in the family meal of cakes and a stew of vermicelli and meat, which is just being served, and which is eaten with chopsticks and rounded off with a cup of *chang*. After this I am requested to take photographs of the family, and especially of the youngest son, a quaint little creature of three, who is his father's favourite. It is now getting dusk, and we take our leave to return home, passing many people who are going back to the town after their day's outing, and several of

whom have, I fear, taken more *chang* than they can safely carry. For these men the journey home is not devoid of incident. At this time of year every road is a running stream, for when a man has turned enough water on to his fields he is not concerned with what happens to the surplus, and the road is usually the most convenient channel for the overflow. Then, again, it is no one's business to keep the bridges in repair, and if one of them should give way it is left to be repaired by the people who find themselves most inconvenienced by its breakage. On this occasion the footbridge, made of two poles with slabs of stone or turf laid across them, is broken, only one pole remaining, and it requires some skill as a tight-rope walker to cross in safety, the penalty for a slip being a ducking. Here a crowd of people has collected to watch the efforts made to cross in safety, and they laugh boisterously when any one falls into the water. In most countries roads in this state would cause some annoyance, but here the broken bridge is looked upon simply as a subject for amusement; and this is, after all, a philosophical way of taking life's little difficulties.

We pass two unfortunate men and a woman who have been arrested for creating a disturbance. These people, regardless of sex, will be taken off and more or less soundly beaten, according to the amount of the bribe they can give their captors, before being brought up to the *jongpens* for the investigation of their case. One of them is probably nothing more than a casual witness of the brawl, and all are perhaps innocent; but here flogging is a necessary preliminary to any judicial inquiry, and after this formality punishment is awarded to the guilty, while the innocent benefit by being let off further chastisement. The Tibetans have a medieval idea that no one will speak the truth until a stimulant of this kind has been applied. It would offend the dignity of the judge were a prisoner to walk into his presence; the accused is consequently carried in, and makes his defence on his knees, in order to show that the lictors have not been lax in their work.

After a residence in India, what strikes one most here is that in their ideas of enjoyment the Tibetans are far more akin to us than are the natives of India, and the whole scene reminds one much more of a fair at home than would a similar festival held south of the Himalayas.

COMFORT OF TRAVEL

THE most comfortable traveller is one who loves the road for its own sake, ignoring alike the virtue of arriving punctually or the chagrin of delay. He goes best who bestrides his own horse or uses his own feet, for only in the saddle or on foot can he taste the fullest

flavour of travel without rhyme or reason, without time-sheet or itinerary. In the unsettled parts of Africa and Asia he may ride for days together, outstripping his gurgling pack-camels a little way from camp, letting them shamble past him at the midday halt, and pitching his tent where

the moon shines on feathery palms. Something of this purposeless wandering is achieved also by the man who sails a modest yacht, handling her himself, coasting as the fancy takes him. Yet even he is the slave of wind and wave, and conditions over which he has no control thus determine his plans, often at short notice.

The railway traveller is perforce a creature of system. He cannot, without grave risk of misunderstanding, enter a train without first providing himself with a ticket, and the printed ticket is anathema to the creed of Stevenson. He knows none of the royal and timeless independence of the tramp. The so-called 'round ticket,' which has a growing vogue with tourists, caters for this instinct of purposeless wandering by enabling the holder to break his journey unexpectedly and to complete it within an agreed period; but though the device is ingenious, it is but a poor makeshift for the absolute lack of method or programme which forms so great a part of the enjoyment of travel for its own sake.

The discomfort of travel irks those only who dislike it. Exception must, however, be made in favour of such sea-sickness as 'utterly cast down and metagrobolised' Panurge, as well as of the insanitary condition of some hotels of southern Europe and the insolence of such innkeepers as offended Smollett. Railway travel has its black side, no doubt. On American lines, more particularly, there is the haunting fear of 'wrecks,' the nightmare of their Pullman cars without privacy or comfort, the inadequate allowance of hand-baggage for journeys lasting several days, and the expensive and unsatisfying meals served in the dining-cars. Americans and Canadians alike, who fondly imagine that their engineers have said the last word in comfortable travel, should try the *trains de luxe* that run from Calais or Ostend, the Nord Express to Russia, the Sud Express to Spain, the Mediterranean Express to the Riviera, or the Orient Express to Constantinople. Thanks to the cosmopolitan standing of the international company, all manner of difficulties are smoothed away, and the traveller may pass through several countries without the least sensation of inconvenience and without a single change of car. People who have had experience of these trains and of the best 'limited' trains of America wonder that those on the other side of the Atlantic should still boast of such primitive arrangements as are provided for their travel.

To the Briton the discomfort of travel on the Continent is immeasurably aggravated by ignorance of foreign languages. In Britain the modern school curriculum is arriving at a recognition of the fact that polite French and fluent German may be at least as serviceable in after-life as hexameters and iambics; but the conversational French that was a widespread accomplishment in the days of the Grand Tour is nowadays rarely met with in the Britisher, in consequence of which there are constant misunderstandings with

railway-porters, waiters, shop-assistants, and others who contribute, in however humble a capacity, to the enjoyment of a holiday abroad.

The comfort of travel depends in a measure on the company one is in. The question of whether the epicure should go alone or in company is for himself to decide. Hazlitt went alone, finding the complete liberty of solitude essential to enjoyment of the change. When, in the case of rest cure, thorough change of environment is prescribed, absolute detachment from his friends should be the traveller's aim; and if he take a companion, it should be one who is a comparative stranger, a plan entailing risks of its own. He needs, however, to be a man of varied resources to enjoy harvesting new impressions in his own company. A crusted misogynist might perhaps enjoy complete solitude, but the average healthy-minded man will find that a little of his own company goes a long way; and even if he starts out alone he will lose half the pleasure of the journey unless he scrapes acquaintance by the way. Like David, he may sigh for the wings of a dove, but he will value his newly won liberty more by sharing it. Yet the choice of a travelling companion is of all things the most difficult. Travel, particularly on board ship or in camp, is a palace of truth, stripping men and women of all their tinsel of pretence and revealing them as they really are. Even on a Continental tour, no association furnishes a more severe test of comradeship than isolation among strangers in an alien land. When one is camping in the wilderness, surrounded only by native servants, the strain on good-fellowship is far greater. Trying as solitude may be in such circumstances, it is yet infinitely preferable to uncongenial company. The absolute perfection of travel is with a comrade of like tastes and interests, who will share the good and the bad of it, cheerfully taking the clouds and the sunshine as they alternate, helping and not hindering, a link with home, yet equally glad to be on *safari*. That is the ideal company; yet how many realise it?

GEORGE MACDONALD.

I HEARD him preach in Oxford, years ago,
A snowy-haired and tender-faced apostle;
I watched the beech against the window blow,
And listened to the throstle.

And still a waving branch to memory brings
Those deep-set eyes and drooping lids, as pressed
Upon too much by earthly visionings,
And wistful for their rest.

Still in the flutings of a thrush will sound
Words that upon us then but lightly fell,
Because they were as simple and profound
As some brief parable

Told by the Master to the hungry folk,
While the disciples murmured; but the foam
Wrote it again on Patmos, and it spoke
Above the rage of Rome.

SEVENTH SERIES

FRAUDULENT 'BUCKET-SHOPS.'

HOW TO DEAL WITH THEM.

By R. S. SMYTH.

IF the public had before them a statement of the enormous sums of which they have been swindled during the last few years, chiefly by the operations of fraudulent 'bucket-shop' keepers, it is safe to assert there would be an immediate demand for such legislation as would put an end to many of the swindling practices in which they now indulge with impunity. It is satisfactory to find that there have recently been several successful prosecutions of the more prominently dishonest members of the fraternity, and as a result the principals are undergoing either penal servitude or long terms of imprisonment. The most notable of these fraudulent concerns were the International Securities Corporation (combined with Feltham's Bank), by which the public lost close on two hundred thousand pounds; Messrs Duncan Forbes & Co., loss about eighty thousand pounds; and the more recent case of the Equitable Exchange, where the loss was forty-seven thousand pounds. A further case, but of a somewhat different character, was that of the Charing Cross Bank, where the deficit was over fifteen hundred thousand pounds. Needless to say, this caused untold misery to many hundreds of unfortunate people, numbers of them helpless, who lost their all.

If the sentences passed on the persons concerned in these striking examples of swindling had a salutary effect in reducing the number of similar concerns, there would be some compensation for the injury and suffering inflicted on an innocent and too confiding public; but unfortunately they have not had that effect. The counsel for the Crown, in his closing speech in one of the recent prosecutions, stated that 'there are at this moment no less than twenty firms or syndicates of a similar class known to the police, who are more or less helpless regarding them.' Private persons who have been swindled are practically debarred from prosecuting because of the enormous expense in which legal proceedings would involve them; and, besides, they do not wish to be exposed to a humiliating cross-examination by the defendant's counsel, and be gibed before the public as fools; all this, too, without any prospect of obtaining compensation for their trouble, loss of time and credit, not

to speak of loss of money. In some cases, as the legal gentleman further stated, it is not until the offices of the swindling concern are closed, and the public commence to clamour for their money when the promises made them have not been kept, that the police become aware of what has been going on. The swindlers have then disappeared, only—as shown in one of the prosecutions referred to—to turn up at a fresh address and under a different name.

A rather significant fact was referred to in connection with one of the prosecutions—namely, that a very large percentage of the fraudulent 'bucket-shop' keepers are domiciled in the City. The question naturally arises, why is this the case? The answer appears to be that if any effort is made to bring them to justice, they will, because of their address being in the City, have their case brought before the City magistrates, with many chances in their favour that they will escape by means of the evidence produced being considered insufficient to warrant a prosecution. Such chances, they conceive, they would not have if their cases, with the same evidence, came before the stipendiary magistrates in other parts of the Metropolis. As stated in an article in the *Financial Times*, 'the City has, in fact, become a sort of sanctuary for "bucket-shop" keepers; for the police, apparently discouraged by the difficulties they have to meet in getting the magistrates there to regard the evidence they produce as sufficient to warrant a prosecution, naturally make fewer attempts than they otherwise would do to bring such offenders to justice. Under the law as it stands, such cases cannot be dealt with promptly, or, except in comparatively few instances, with a reasonable prospect of success, and the attempts at swindling therefore go on.'

The question, then, arises, what remedy should be applied to an existing evil of large magnitude? An eminent king's counsel who was engaged in one of the prosecutions—influenced, no doubt, by the obviously untruthful statements contained in the flamboyant advertisements that had appeared in several leading newspapers—suggested that the Government should introduce a bill to make newspapers responsible for the misrepresenta-

JANUARY 11, 1913.

[All Rights Reserved.]

tions in their advertising columns. The offer of four hundred or even five hundred pounds for a whole-page advertisement of the class referred to—the Equitable Exchange had several—is doubtless a tempting one; but, while newspaper proprietors may be reasonably expected to exercise discrimination in accepting such advertisements, which contribute so largely to the success of the swindlers who present them, to attempt to place on the owners of newspapers the sole responsibility for the truthfulness or otherwise of statements made in the various advertisements they are asked to publish would be obviously unfair. It is only right to say that in the great majority of cases careful discrimination in the interest of the public is already exercised.

A leading London newspaper suggests the simple expedient of 'making it illegal to use the mails;' another metropolitan newspaper says that 'when the Postmaster-General learns that the post-office is being used for criminal purposes, so as to make it a public nuisance, it becomes his duty to take steps to protect the public against such abuses;' while a third newspaper, an important financial one, endorses these views, and says 'there would be no difficulty in discovering those whose contributions to the mail-bags ought to be stopped.' Now all this implies that letters posted by obviously dishonest 'bucket-shop' keepers should not be transmitted. But how is this to be prevented? How could such letters be detected? In the absence of some external evidence of their origin—which, of course, would not be given—it would certainly be impossible to identify them, and any attempt to do so, no matter how careful the discrimination exercised, would inevitably result in the letters of other persons being occasionally opened. The system, if adopted, might indeed lead to a bureaucracy that would be most objectionable; it would never be sanctioned by Parliament, nor should it be. There is a deep-rooted and very proper objection to the opening of any letters in the post-office except such as cannot be delivered, and the practice would be quite repugnant to British feeling. The real remedy lies in giving authority to the Postmaster-General to prevent the *delivery* of letters addressed to 'bucket-shop' keepers, who, when they had ceased to receive the remittances from their dupes, would soon find their occupation gone. The letters would necessarily be opened, not, however, for the purpose of scrutinising their contents, but exactly as in the case of letters the addressees of which were 'dead' or had 'gone away,' to ascertain the names and addresses of the senders, in order that their correspondence and money might be returned. This is what is done in the United States and by our kinsfolk in Canada and Australia. The letters for the persons there suspected of carrying on dishonest businesses, however, are not withheld from delivery until the fullest opportunity has been given to the suspected persons of proving their

bona fides and they have failed to do so. But in New Zealand, where letters are similarly stopped, no such opportunity is given. The authorities in that Dominion satisfy themselves that fraudulent practices are being pursued, and without any notice to the persons concerned their names and addresses are inserted in the *Gazette*, and simultaneously the delivery of all letters addressed to them ceases. This course, however, cannot be advocated. Every opportunity to show that no false representations have been made, and that the business is being honestly conducted, should first be given. If this were done and satisfactory evidence were not forthcoming, the return of the letters to the senders would not form any good ground for complaint.

In the United States, in addition to issuing 'fraud orders' for stopping letters addressed to persons engaged in swindling transactions, legal proceedings for the fraudulent use of the mails have latterly been instituted against them. The following extract on this subject from the Postmaster-General's last report will be read with interest: 'The crusade started by the post-office department early in the year against the fraudulent use of the mails has been pushed with great vigour. During the last few months the principal officers of thirty-four corporations, companies, and firms have been placed under arrest by post-office inspectors for swindling the public by this method. In forty-six additional cases individuals have been arrested for conducting similar schemes to defraud. It is estimated that the eighty important cases recently brought to a head represent swindling operations that have filched from the American people in less than a decade fully a hundred million dollars. As the work of investigation proceeded it became apparent that schemes for swindling through the mails were vastly more numerous and extensive than had been supposed. Many of these fraudulent enterprises proved to be as far-reaching in their ramifications as the postal service itself. Not only have they swindled many thousands of credulous people out of money foolishly invested, but to a large extent they have shaken confidence in legitimate enterprises. The stamping out of these is, therefore, as important to capitalists engaged in lawful business undertakings as it is to investors. Their prevention will undoubtedly save to the American people millions of dollars annually.'

The Equitable Exchange swindlers advertised extensively; they had a full-page advertisement in the *Daily Telegraph* that their profits amounted to one hundred and seventy thousand pounds, and as evidence of this they furnished a list of cheques to clients which they said could be inspected. The cheques were inspected, and by the police, but unfortunately not till the principals were being prosecuted. It was then found that out of the list of seventy-eight persons to whom it was stated cheques had been sent, the number of those who

had received profits was only seven, and that the actual amount sent was only about thirty pounds. Now in this case inspection was actually invited, and if the Director of Public Prosecutions had sent an officer to verify the statements so publicly made, and made obviously for the purpose of swindling, their falsity would at once have been discovered. The return of all letters sent to the Exchange under the plan proposed would have immediately followed; this would have had the effect of cutting short its career, and the heavy loss sustained by the public would have been prevented. Similarly in the case of the Charing Cross Bank, a statement of assets was extensively advertised, and the advertising was continued for a long time, even after *Truth* and some other London newspapers had shown the statement to be false. Prompt intervention by the Director of Public Prosecutions would have established its falsity, and the delivery of all letters for the bank and its branches would have immediately ceased.

Of course legislative authority would be necessary before the proposed course could be adopted; but it is submitted that the remedy suggested is as simple as it would be effective, and that to all persons who desire to carry on their business honestly, as well as to the community generally, it would be unobjectionable. The late Postmaster-General stated in the House of Commons that he regretted his powers in regard to the class of correspondence in question were so limited (his powers extend to *circulars* only), and expressed a wish to be able to safeguard the morals of the people as well as their

purses. Under the remedy proposed, while his successors would have the power he desired, they would be free from the responsibility of deciding as to the honesty, or otherwise, of the addressees of any letters coming into their charge; that would be undertaken by the Director of Public Prosecutions, from whom they would receive the names only of those persons who had failed to show that they were not engaged in fraudulent pursuits.

By way of emphasising the argument contained in this article, it may be mentioned that some months ago there was another successful prosecution of fraudulent 'bucket-shop' keepers, father and son, who were sentenced to five years' penal servitude and nine months' imprisonment respectively. The career of the father, as read in court from the police records, was as follows: In 1882 punished by nine months' imprisonment for fraud, and in 1897 by five years' penal servitude, also for fraud; was an undischarged bankrupt; and with three other persons had been connected with a fraudulent business carried on as the London and New York Stock Exchange, by means of which a sum of no less than one hundred and twenty thousand pounds was obtained from the public. All this was well known to the police; yet, owing to the difficulty of getting such evidence as in the present state of the law would be likely to secure a conviction, the couple were allowed to prey on the public to the extent of forty-seven thousand pounds before their arrest! How much of this would have been saved had the letters sent by their unfortunate dupes been returned to them!

THE SHIP OF SHADOWS.

CHAPTER IX.—A NEAR THING.

'SIX bells had gone. The glass was falling. I remember the sky gradually thickening with creeping clouds that joined together into a great dark hulk, gathering to itself a lesser fleet of sombre sails until its arch was one great smoke-pall sagging down as if the heavens were shrinking and narrowing over our tiny vessel, the illusion of the lowering of the sky aided by the fading day.

'Night fell. The sea was pulsating under a long, uneasy swell; the quiet of it eerie after the bluster of the waves under the fresh wind we had been running before. We were in the track of the transatlantic steamers. Once I fancied I heard the *halloo-oo-oo* of a distant ocean-voice. The Old Man was on deck, and I saw him take a look at the barometer. Then he joined the mate. I could hear them talking, and caught a word now and then. "Weather," "Ay, mister!" "All hands." "Fog." Another look at the barometer. Then they strode from rail to rail peering anxiously into the dark. I

was trying to pierce the gloom, when suddenly a wet, clammy hand covered my face, and a tall, gray wall of mist rose silently out of the deep and laid us in a dungeon. The fog was so dense, so amazingly sudden, that in a minute we could scarcely see each other; the hails from one man to another sounding thin and childlike in the rank, steaming vapour; figures appearing, groping their way on deck, shadows looming huge and fantastic; the lamps at one moment mere pin-pricks of light, at another like the yellow, frightened eyes of a bewildered animal. Then out of the void somewhere—impossible to tell exactly, for a fog juggles with sounds as with shapes—came distant, mournful sea-voices calling, echoing, "Where? Where? Oh, where?" Our horn hoot-hooted, and the ship's bell was rung, sounding as ludicrously futile as a tuning-fork amid the daunting silence of our listening. Ask a sailor-man what enemy on the sea he hates most, and you'll get a swift answer if he has ever waited and waited and waited for a fog to lift,

his ship sailing like a blind ghost into nowhere, round him the dread voices of other blind ghosts groping, the fear of death plain to hear in their nervous barks, in their long, shaking walls.

'Suddenly'—he paused, passing a hand over his head, and I saw the wet hair and the little beads of sweat on his brow—'suddenly a terrified shout rose from the forward chains, then out of the unimaginable blind darkness leaped the most dreadful sound I have ever heard, a great hoarse giant's bellow rising in a curdling arc of warning, shearing the fog like a knife—the siren of a liner! My spine froze. There was a moment's silence, half-hope, half-despair. All I can recall now is a cry from the mate; a terrified answer, the scurry of feet; the skipper throwing himself on the schooner's wheel; then a vast Thing, an enormous shadowy Shape, crossing in front; *The Berwick Law* lifted high in the wash for a shuddering moment; the grating, tearing sound. . . . I waken up sometimes hearing it. It's burned on my memory; a dreadful sound of something falling, crashing, breaking forward; then the wall of the liner's tremendous hull sliding out of sight; belching smoke; the grumble of her engines thrumming down to silence as she vanished into the immensity of the fog. The floating castle probably had not felt our tiny vessel's impact more than a man would a mouse. As for us, our hearts in our mouths, we held on for dear life and dry burial. A huge graybeard from the liner's wash swept us clean; then another, and another; *The Berwick Law* staggered and fell in the trough; got up again—somehow—to face the yeast and turmoil. I heard the Old Man shout, and caught a glimpse of him sent spinning into the scuppers. Next instant I saw Lowden tear along to the wheel. "Back, for your life, man!" I fairly yelled to him, for a tremendous sea was rearing its ugly head to strike. But he faced death without a falter, yielding not by an inch! The schooner gave a sickening shudder when the blow came. This was "good-bye," I thought. I held on to the rail, and she settled down—down. The next wave lifted her under the counter. She rose. There was just a chance, and we breathed again.

"To the hatches!" shouted a voice of command, and I recognised Lowden's. We sprang up, and fought like devils to keep the water from below. My God! I don't want to rebuild that night—the blinding rain, the darkness, the sudden gale that rose, the murderous seas, the desperate attempts of the wounded ship, the snapping fangs of death. Day at last broke, and saw us all weary-eyed, drenched, and shivering. *The Berwick Law*, with her bowsprit trailing alongside where the liner had grazed her, her deck swept clean by the great ship's wash; the galley smashed and the companion gone; the cabin bulkheads and the waist bulwarks smashed; the foremast snapped clean at the top; the ship

a battered and broken shadow of herself. The sea was still running, panting, on her flanks, but the big graybeards' heads were lower. We had just missed death.

'Poor Hulse had got two broken ribs and a broken arm; and the Old Man, who had got a nasty knock on the temple when he was torn from the wheel, now came aft to Lowden at the wheel.

"Ye saved my ship, my man, and the lives of us all," he said with just a shake in his voice. His wife was standing by—pale, but dry-eyed, a brave lass, although perhaps not a wise one. It's hard to say! The Old Man had his hand half out to shake hands with the other, but I think Lowden didn't want to see it.

"All in the day's work, sir!" he said awkwardly, touching his cap, and then busied himself at the wheel. He gave just a glance at the woman; but there was a great light in his eyes. If she hadn't been on board I'm doubtful whether he would have stirred a yard for our lives. Certain I am that he wouldn't have done so for his own.

The Berwick Law, for a cripple, staggered on gamely. We managed to clear the wreckage, but it was slow and desperate work. Danger hovered close. She was making a bare three knots, with no heart in her, and every man-jack of us knew she would be about as much use in half a gale as a village ferry-boat. "Only three days or thereabouts, lads, an' we'll be snug at anchor," the Old Man would say; but his eyes were sunk in their sockets, and he paced the deck like a caged beast.

A glimpse of the sun would have heartened us. I had heard of the Atlantic summer, and its beauty at that time of the year, but we saw none of it. The sun kept stubbornly hidden under a dark mask. Every hour of the day was gray; nothing to see but the waters tumbling and grumbling round us, and the night's black dark. Now and again a vicious gust would come, and the schooner would heel over to the scuppers and then bury her head despondently, crawling along in the mirk. The bellowing gale never ceased to flout us, never ceased to play a cruel cat-and-mouse game with the poor maimed ship.'

CHAPTER X.—IN THE BOAT.

'THE beginning of the end came in the afternoon watch. Evan and I were having a welcome mug of coffee in the remains of the smashed galley.

"No," Evan was saying, "there nefer wass luck on a sailin'-ship with a parson or a Rooshian Finn or a woman on board, maybe barrin' the Ark, and that wass what they will pe callin' an extra speeshal excursion. An' we sailed on a Friday, too!" he added lugubriously, giving the fire a vicious poke.

'The words were scarcely out of his mouth

when I saw the mate go up to the Old Man. They were near at hand, and I listened. "Leakin' badly, sir," he said, shaking his head. The skipper himself went to take soundings.

'Evan looked at me, uneasiness struggling with the joy of the seer in his eye. "What wass I after tellin' you?" he said.

'Just then Lowden came along. "She's making a foot an hour," he said grimly; and I knew, and so did every one of us, that *The Berwick Law*, bar miracles, would never see a harbour light again. Well, we stood by the pumps for a day and a half, saying little, striving for dear life, sweating, toiling till we dropped. The water in her hold mounted inch by inch, until it gained beyond hope. The very voices around us spoke in the farewell of a doomed ship—the complaint of the booms, the halyards groaning, the wind moaning through the shrouds.

'The Old Man was loath to face the bitterness of surrender, but there was nothing else for it. Towards evening we took to the boat, and stood by watching the schooner settling. When the dawn of another sullen day broke there was nothing to be seen except the long furrows of the sea that had throttled her. *The Berwick Law* had gone down in the night.

"We did—our best, lads," said the Old Man through his teeth, one big hand on the helm, the other patting his wife's shoulder. He had aged ten years. "Ay, so we did!—Dinna greet, Madge, my lass! I'll get you another." "If ever we see the shore," was his unspoken thought, and ours.

'We seized what snatches of sleep we could in turns, in our soaked oilskins, living on sodden biscuits, the master's wife lying covered up in the stern, and the whole of us silent and hollow-eyed. I think that I lived years in the days that followed. Just as on the eve of a long parting men are silent, so it was with us. Death was too near. The only sounds were poor Hulse's groans as the pitching racked him, the skipper's few orders, the hoarse bellow of the sea.

'Lowden extorted my admiration. The man must have been made of whipcord. Sailing was out of the question in that sea. All we could do was to keep the boat's head to sea with the oars. Hulse was a cripple. The Old Man steered with an oar, for the little helm was useless in the uncertain sea. Lowden pulled the stroke-oar, both Evan and myself at the other one; and the boy Callander slept, exhausted and drenched, in the bow. Our hands were torn and blistered, and my back felt as if seared by a hot iron; but Lowden went on for hours, refusing to rest, time and again tiring us both out. I see his notched, vertical frown and his grim, set jaw to this day. And Fate sat beside him grin-

ning. The captain's wife lay in the stern sheets, exhausted, scarcely opening her eyes, the woman he loved, the picture of death, within a foot of him every time he bent over the oar; every endearment, every caress by her husband lashing him on the raw.

'For two horrible ice-cold days and nights the tiny boat climbed the sea's slopes, climbed to plunge down into giddy depths, drenched with spray, buffeted, every sinew strained. But she had been honestly built, thank God! and held together.

'The morning of the third day seemed too kind to be real. It broke fairly clear. The sun was struggling out. Young Callander was standing in the bows drying some of his wet clothes. Suddenly he gave a yell of delight, and sang out, "Sail O!" I hardly dared to look, but there she was, a beauty, sailing like a bird. Coming down on us snowy-winged in the sweet morning—for the sun had made a sudden stride—she looked like an angel from heaven. She was a Gloucesterm'n, the *Julia Johnston*. Good-luck to her, wherever she is! She stood by and took us on board, her crew quarrelling with each other about who should show us the most kindness.

'We were somewhere about lat. 49, long. 45. She was making for Newf'un'land for bait—caplin, I think; but she altered her course a point or two for us—bless her!

'We slept round the clock, and when I came on deck the sea's voice was a whisper, her fickle face sparkling, transformed in the sunlight.

'Since that week, I never look on a sunlit sea without thinking of the Great Painted Desert beyond the Mormon Oasis, where the rolling sands, by some uncanny alchemy, suddenly pretend to glow and beckon with a thousand twinkling jewels. The mirage smiles and smiles, and is a villain, and men follow it, and go mad, and disillusion and tragedy lurk unseen on the trail. For that morning the Atlantic threw off her gray, sightless mask. Every inch of the sea shone dazzling and prismatic in the clear air; now liquid gold; now purple heathery slopes; now snowy-white as daisies, to change under the swift fingers of the sun to bright flaming gorse; to a great shield shimmering with incredible radiances, topaz, hyacinth, opal, emerald, ruby; to every shade of blue, aquamarine, indigo, lazulite, hyacinth, turquoise borrowed from the sky.

'Black Care was a thousand leagues astern, and the Gloucesterm'n, careering down the wind, sailing like a witch over the diamond knolls, on the morning of the 10th of June landed six thankful souls in the little haven of Saint Pierre.'

(Continued in following section of this part.)

SOME ASPECTS OF MODERN LUXURY.

THERE is no brief observation upon wonderful London and the life that is lived in it that is half so frequent, anything like so trite, as that it is a city of strange contrasts. It is a very slight variation, often made with the object of suggesting the special capacity for discernment on the part of the observer, that it is a place of really terrible, most horrible contrasts. But London is in sections which do not mingle to any extent, so that not merely strangers but even the people who live always in it move about only in one or two sections which interest them, profit them, or, as it may be, embrace the only communities to which they have facilities for admission. So most of those who speak of the contrasts, making affectation of superior knowledge, are ignorant upon the subject.

The truth is that the contrasts are infinitely greater and infinitely more appalling than any of these light, trite talkers could imagine; for in the nature of things the contrasts of London can rarely be beautiful or delightful to contemplate, since the simplicity of nature, which is the most beautiful thing in the world, is now almost entirely banished from the great city in every shape and form. Further, and to come at once to our special point, these contrasts are far greater now than they have ever been; in the great year of the Coronation of the reigning King they were intensified immeasurably. There was some sound justification, of course, for great luxury in London then, and for the spending of money by townsman and country stranger as probably it had never been spent before since the beginning of the world. But all this, mark if you please, was not because of the Coronation or because the weather was beautiful beyond precedent, and the times seemed to make for laziness and pleasure; it was merely the culmination of a strong movement towards increased luxury of life among the people of one or two of the sections which had been increasing in strength for many years previously, and desired some excuse for a tremendous outburst. Again, new and higher standards were set in this season which will be largely, if not entirely, maintained in the future; indeed in some particulars they will no doubt be exaggerated.

When one speaks of luxury in these connections one means chiefly the luxury of spending money, and not necessarily or even generally the luxury of possessing rare and really valuable things or experiencing strange delights which have some fair relation to the price that is paid for them. Go to the right places, and you may get better value for your money in London than anywhere else in the world. Yet there is no place known to man where you may obtain poorer value, where you may spend sovereigns and bank-notes and

get the poorest exchange in kind. Even the rich Americans—and, yes, perhaps those Americans more than any others—appreciate the fact that pent-up wealth accumulated quickly and easily by high commerce may be dissipated with better convenience at the headquarters of the greatest Empire than at any other place. It is riches of this kind that have created that special sort of luxury that we mean, which is greater now than ever previously—the luxury of spending much and gaining little save the knowledge of having spent. And now, in contrast, never were poverty, misery, hardship, starvation, hunger—never were all the attributes of human wretchedness keener than at the time when a party of people might and did dine at a cost of fifty pounds a-head in a London restaurant, and it was proposed to pay six thousand pounds to a black man to fight a Briton in the ring. Now, be it understood, we are doing no moralising here, but merely presenting plain facts that seem to make up a curious and interesting study of a phase of the infinite variety of life.

To those who by their circumstances feel themselves to be concerned upon the question, and are without experience, it may be said that it is easier to spend much money in London upon food and the concomitants of luxurious dining, and upon articles of dress and personal adornment, than in any other little way; though, to be sure, the clothes make a weak companion to the food in this matter. It was explained a little while since by one of the very highest kitchen-authorities in town how one who was so disposed might spend two thousand pounds upon a little dinner-party of twenty, or one hundred pounds a-head, and that with, as it was said, no waste, no fantastical accessories, but merely good food, good wine, and rich exotics for the table. There was a clear insinuation by the authority that the host in such a case would get very good value for the cheque he would write; and it was explained in detail how it would all be done, how indeed much of it was constantly done. Upon the menu of this repast there would be many pretty and most appetising trifles which could not be prepared to the order of poor people, though they are familiar to the rich. Taking an example, there would be *sterlets du Volga à l'Impériale*, which is not a dish that is commonly served in cottages, but is often enough prepared in London. It can be made comparatively cheaply—say for twenty or thirty pounds—to provide sufficient for the party, properly and well, without any unnecessary expenditure. The *sterlets* are taken from the Neva, and the true gourmet insists that they shall be dropped into the saucepan alive, as you may see them in the fine restaurants of Moscow, where of course it is easily done. But to do that same in London

requires the most careful and expensive arrangement. For a party of twenty at least four sterlets would be needed, and to ensure four being brought alive to London, twice the number would need to be despatched from Russia. A man would have to be sent with them to look after them and see that the water in which they were kept was properly changed every twenty-four hours. The cost of the sterlets and their carriage in water would be seventy pounds, and the attendant, his charges, his journey, and the incidental expenses would bring the bill for delivering the sterlets to our London kitchen up to one hundred and forty pounds. Then three pounds would have to be spent on four bottles of champagne to cook them in—you will perceive that we are being strictly economical, for champagne at much more than fifteen shillings a bottle may be bought anywhere; and carps' roes and trimmings would cost another five pounds. Allowance being made for four sterlets that perished on the way, those that came to table and were toyed with for a few moments would cost some fifty pounds apiece. There would be other rare and expensive morsels such as those who like these things like most and certainly will have. There would be Portuguese *outardes* or bustards, and *granites à la Malvoisie*, costing together about thirty-five pounds; there would be eighty ortolans and forty truffles in the hollows of which they would be served, costing eighty pounds; and numerous other special dainties later, such as dessert peaches perfumed with real essence of rose, and strawberries served on a foam of *Lachryma-Christi* wine. And so on, as I could explain it, to the full extent of the two thousand pounds for a really Lucullan feast as planned—let me insist upon this—by one who plans them constantly and knows the business.

'But,' it will be remarked at once, 'this, after all, is merely put forward as a scheme, a possibility. Does anything of the kind really take place in London?' I have very good reasons for thinking that it does. Be it remembered that not always are such matters arranged for social advertisement of the kind that is given by newspapers. Of dinners for large parties upon which fifty pounds a-head have been spent I have the most authentic information. One evening, at one of the foremost restaurants in Piccadilly, a party of thirty sat down to a dinner given by one gentleman to celebrate the departure of a friend for Japan on the following day. The room was fitted up as a tent, the walls being covered with white saten and the ceiling hidden by Japanese flags, while facing the entrance was a large painting representing a window through which could be seen a pretty view of Japanese scenery. There were numerous other arrangements to match, and the dinner, judged by the standards of a Croesus or Lucullus, was remarkably good, without embracing any sterlets or ortolans. After it there was a pretty enter-

tainment, and the total cost for the party of thirty was just about one thousand five hundred pounds. This was not merely a scheme—it happened.

But to those who have acquaintance with these matters one must make excuse for mention of such familiar occurrences. Many, many fifty-pounds-a-head dinners have been served and eaten within a mile of where I write. I have before me now the menu and particulars of arrangements of a dinner that was served to thirty-four guests at a total cost of over two thousand pounds, or about sixty pounds a-head, at one of the great hotel restaurants which may be entered either from the Strand or by way of the Victoria Embankment. This, for a special reason, was arranged as a North Pole dinner; the apartment was filled with imitation icebergs, there was a 'North Pole' in the middle, and so forth; and there was a suitable entertainment following. The dinner was quite excellent, and was much enjoyed; while the host, who was a connoisseur in the art of expensive dining, having a capital of a million pounds at his disposal for the pursuit of his hobby, and having done this same kind of thing or better on many previous occasions, laid a present beside each guest, some of which presents were jewels that had cost a hundred pounds each.

It may be objected that there is about these affairs something of the nature of the freak-dinner which is common enough in New York with its prodigal Four Hundred, and that much of the money is spent on other things and sillier things than food and drink. True; but I have shown how, if it were desired, each lady and gentleman could eat and drink away a full hundred pounds, and it is a matter of taste how much shall be devoted to simple food and how much to less troublesome things when the limit of general expenses is to be kept down to fifty or a hundred pounds per person.

And, again, it may be urged that these polar and Japanese trappings and all such things are exceptional and mere stupidities, and that if these functions were shorn of them, the expenses would so dwindle down that among even rich and extravagant people in London who have not these whims there could be no such costly feasts. But it is beyond doubt that dinner-parties costing from five hundred to a thousand pounds have been given in the private houses of Belgravia and Mayfair. There are such houses where the *chefs* are paid salaries of from eight hundred to fifteen hundred pounds, and it is said that there is one master of the kitchen in receipt of two thousand pounds, a year. Of dining in such a house, a critic once said that a dinner would be considered fit only for a work-house feast if its materials, including fruit and wine, cost much less than thirty-five or forty pounds. At an evening-party in a house of this kind on one particular occasion the hostess stated

that the flowers had cost four hundred and eleven pounds. Blocks of ice covered with purple orchids stood at the foot and head of the staircase, roses and smilax fell from the balusters in glorious cascades of colour, there were silver bowls of rosebuds on the tables, and long white sprays of the most expensive orchid, the *Odontoglossum Alexandra*, were laid along the mantelpieces in the drawing-room. And then the fees paid to entertainers are very, very large. If you will have a prima-donna to sing a song of Italy, you must pay her fee though but fifty are present to listen to her trills instead of fifteen hundred in an opera-house. A fee of a hundred or two hundred pounds is quite common; I know of Caruso having obtained three hundred and fifty pounds for singing after dinner, and no doubt others have done as well. Quite insignificant entertainers will receive a couple of five-pound notes.

All this is, of course, luxury in the highest degree and in its most expensive forms. Now for a sharp contrast, and the scene of it was within a quarter of a mile of the place of the fifty-pound-a-head dinners. You have heard of the Embankment, a place that is pleasant to walk along, but less so than it was before the electric trams began to hum and rattle along it, and from which you may go up to the great restaurants. It is a place of starvation horrors, chiefly at night. The hungry and the homeless—sometimes through their own fault, often not entirely—make it their resting-place, the wooden seats being their beds. Underneath the railway bridge at Charing Cross you may often see a score or more of the saddest failures of the human kind huddling close together for protection from the icy winds that whistle through, and perhaps by association and sympathy minimising a trifle the pangs of hunger. Their souls are dead, but their bodies are in painful life.

I take one case, with official certification of the facts, from among many inquired into in coroners' courts. A poor beggar had thrown himself into the Thames within sight of the great restaurants, and another of the Embankment wretches had been a witness of the tragedy. His name was Sutherland, and he called himself a 'general labourer.' He said he lived on the Embankment; he slept there because he had no money to pay for lodgings or food. 'Supposing it is cold?' they asked him. He said he had to put up with that. 'How do you get on for food?' was the coroner's question. Sutherland answered, 'I have to trust to Providence for that. If I can't get it I have to go without.' He added that he had been out of work for several weeks. Then he told the story about the drowned man Honeyball. At about a quarter to three in the morning Honeyball came and sat next to him on a seat on the Embankment, and complained that he had had much trouble, and nothing whatever to eat on the previous day, and was very hungry.

Sutherland knew something about hunger, and—perhaps with an expert's contempt—observed, 'Is that the only day you have been without tommy? What about me? I have had none since Wednesday.' Wednesday was four days past, and it was true Sutherland had eaten nothing for these four days, because he could not get anything to eat. Honeyball said that, anyhow, he was getting tired of it, and should not put up with it much longer. He would make a clean job and finish it. Sutherland, with whom misery was commonplace, told him not to talk nonsense; but Honeyball rose from his seat and walked towards the steps of the Temple Pier. Just at that moment a miserable woman who was sitting dozing on one of the seats was taken ill, and Sutherland went over to her. Then he walked towards the steps, and saw Honeyball throw up his arms and take a header into the river and disappear. He gave the alarm. Honeyball was eventually taken out dead. At half-past five Sutherland went once more in search of work. For his class, he was a respectable man. He said he did not like to fall asleep on the Embankment, on account of the sort of people he had to mix with. Of course there is no connection between this affair and the peculiarities of life that I have already described, but merely a contrast—comedy and tragedy.

It is not very pleasant, however, to contemplate such matters. Let us have another turn with the extravagant side. Admittedly, some of the cases already quoted were those of a very small minority of inconveniently rich. But they give a certain lead, and consequently a wild extravagance is carried on. The other day I read in the *Revue* of Paris the following: 'Thrift is everywhere becoming a rare virtue. After strenuousness, recklessness is the chief characteristic of the age.' But Paris cannot equal London in the recklessness of extravagance, because she has not the means. A little while since the wife of one of the most prominent statesmen of the time was in the witness-box at a *cause célèbre*, and observed that 'extravagance is usually a passport to society.' Following upon this dictum—obviously true, but still a little remarkable in its candour and considering its source—we were allowed a peep into the secrets of the expenses of some members of the so-called smart set, and more particularly those who would be smart. Statistics backed by good authority were printed, and it was ascertained that it was quite impossible for a lady in society, even though her tastes were modest, to dress on a thousand pounds a year. To come anywhere near success on such a sum would need the juggling abilities of a Chancellor of the Exchequer. My lady who was really smart would need to go periodically to Paris to have a frock fitted, and sometime perhaps to New York for a new 'face treatment.' For the

season she would need some half-dozen evening-gowns at a cost roughly of a hundred guineas each. Readers whose excellent and most charming womenkind could not and would not spend such sums on their attire should be neither shocked nor incredulous at these statements, for the figures given are, after all, trifling in comparison with the possibilities, and the tendency always is for them to be increased. Not long since it was authoritatively explained how a certain young lady of eminence in New York society spent twenty-five thousand pounds a year on dress. Four-fifths of this went in two-hundred-guinea gowns, lingerie cost three thousand pounds, the damsel needed fifty pairs of shoes at ten pounds each, a pair of gloves for every day in the year at sixteen shillings and eightpence the pair, and so forth. For the Horse Show in Madison Square Gardens she had prepared for her no fewer than seventeen gowns, so that she might not be seen twice in the same gown during the show. There you have the possibilities. But, it will be said, that was in New York. Yes; but when this apparently wonderful case was laid before Mr Redfern, of the Bond Street firm, he said that it was nothing, or words to that effect. He pointed out that if you stripped the twenty-five thousand pounds of duty fees—paid on importations from London and Paris—it might be brought down to about nine thousand pounds, and many women in London and Parisian society spent that amount. 'Indeed,' said he, 'we have experience of many such cases with our own clients.' He was prepared to commit himself to the statement that such a great lady in Parisian society as the Countess Boni de Castellane was far more likely to spend twenty thousand pounds a year on dress and things appertaining to dress than ten thousand pounds. Despite his utmost efforts, modern trousered man cannot spend anything approaching to these amounts on his dress; but there are some men who perhaps would do so if they could, for there has been a revival of fine dandyism in recent times, and men who can afford it certainly spend far more on their clothes than their fathers did. Unlimited fancy waist-coats and magnificent sables give room for great extravagance; and why, then, should we wonder when we are told by those who know that there are many men who will spend a thousand pounds a year or more on their dress?

There are other wonderful possibilities in modern feminine extravagance. Some forms of collecting, which have little enough to do with either art or vertu, seem to have been specially invented as an outlet for money. Once you make up your mind to collect things which are almost non-existent, you may keep your bankers busy. And if Carlo or Towser, roaming in country fields and lanes, and doing his doggy duties well in all weathers for the reward of a bone or the crumbs that fall from his master's table, knew what was spent

on the little fancy dogs of the fashionable West End, he would surely be glad, in his canine pride of race, that he was not a fashionable London dog. There is a canine outfitting establishment in the Burlington Arcade where you may learn much about this special form of extravagance, and where anything from twenty to five hundred pounds may be spent on the purchase of some peculiar toy pet. The animal is provided with fancy overcoats which change according to fashion. Some are made of seal-skin at a cost of five guineas, and another pound or two may be needed for one that is trimmed with ermine. Pretty Fido has boots made of rubber, tanned pigskin, or patent leather, costing from six to ten shillings a set; he is provided with the most beautiful thing in the way of an upholstered basket for the drawing-room, an expensive toilet-set, and some costly conveniences for travelling. The man who keeps a bull-terrier, or the gentle lady in the country, finds it very hard to credit that such things can be; but, good critics, you have not been admitted into the society where they take place, and, to your satisfaction, you will never be. They can tell you at the place in the Burlington Arcade of an order that was given for a dog's gold collar studded with diamonds.

Yet, after all, these are side-issues, and there are hundreds of them, so that they cannot be described. Now, instead of considering the ways and the whims of the comparatively few, let us descend some way in the social scale and examine most briefly the system of living of thousands of people in London who do not belong to 'smart' society, and have no ambitions in that direction. The change in ideas and ideals among a great part of the middle class in recent years has been very remarkable. It is there for all to see; nothing could be more noticeable. The bacillus has caught them. They have been disturbed by the show of wealth and luxury that everywhere has been presented to them. One by one they fell to little, insidious temptations towards extra and needless expenses which in themselves seemed nothing at the time, but in their sum became, if it had been properly realised, a serious matter.

Consider the possibilities of an afternoon and evening. The lady goes forth in a private motor-car which she has hired by telephone for the afternoon—two guineas. She does a little needless shopping with a lady friend, buys a sovereign's worth of flowers, and meets her husband, free of the City, at an appointed spot, and they proceed for tea to a fashionable place in the region of Piccadilly. This tea-habit has become a great craze. The three of them listen to a band for a little while, sip a cup of just ordinary tea, and dally with a fancy cake or two. Three teas at three shillings and sixpence each, nothing less, and a shilling for the waiter—eleven shillings and sixpence for less than one shilling's

worth of value. But it was being luxurious for the time; and, with the changed habits and ideas of these people, it seemed to be worth the money. There is a little more shopping, and by the time the afternoon has gone a five-pound note has gone with it. Then there is the evening out. There is the hired motor again, a dinner for two costing not less than two guineas, two stalls at half-a-guinea each, a supper afterwards at a guinea, and tips galore. It needs seven sovereigns to see this evening through. Still, this is the view that these people have of the higher life, and they do not trouble about the cost of it.

Home-life of the old kind has by this time lost all its attraction. It is regarded as a nuisance. Housekeeping is not fashionable. What then? There is a new and most popular vogue for the satisfaction of those who have become thus restless. They give up their house and store or sell their furniture, and turn into a good hotel to live. There, it seems to them, life is so easy and comfortable, and there is the proper sense of luxury. You have only to ring a bell and your utmost want is brought to your elbow in a few moments; and at the end of the week, when the bill is presented and settled, everything is done with, and there are no more worries, no rates and taxes to pay, no heavy electric-light bills to settle, none of the thousand worries that afflict the people who live in a house in a fashionable suburb. The new life is easy and 'smart,' and the cost of things is no longer counted. That cost, however, is no trifle. Once you begin the hotel habit, as thousands and thousands have done in London in the last few years, you find that the enticements to luxury fast increase. When the entire menu of the hotel restaurant is at your disposal, and the wine-cellar with it, more strength of mind and common-sense is needed to be reasonably frugal than is possessed by these people now. There are the apartments for which anything up to a hundred pounds or more may be charged for the week, breakfast for two may cost a sovereign, lunch for four might come to a 'fiveer,' and dinner for four to more than that; and the hotel charges for innumerable little commodities on the grand scale—a sovereign may be billed for the flowers on the dinner-table! It should be understood that these figures or estimates are not guess-work; they are the figures of facts in the positive experience of various people or obtained from the managers of hotels themselves.

Some extremely strong words, which need not be repeated here, as they may be guessed with ease and certainty, are used sometimes in describing the system or principle upon which hotel proprietors make their colossal charges. Take their wines. I once noted that for a

five shillings the dozen bottles was charged by a fashionable wine-merchant in the West End of London. Without a doubt the same wine could have been obtained much more cheaply from other wine-merchants; but I was engaged upon a mission of curiosity and comparison, and wished to start very fair with the adversary. Subsequently at various times I picked out this same wine on the *cartes des vins* at most fashionable places. It was never priced at less than fifteen shillings the bottle, generally it was more than a sovereign, and in one case it was twenty-four shillings. When you come down from champagne to hocks and clarets, the values of which are even less understood by the consuming public, you will find the disproportion much greater. Again, it is as certain as anything can be that many of the wines that are classed on the *cartes* as vintage wines, and high prices charged accordingly, are not by any means what they are represented to be, but merely ordinary stuff which might be bought at a merchant's for eighteen or twenty shillings a dozen. In the matter of little things in the way of spirits it is the same, or worse. You will be charged three shillings and sixpence for a liqueur-glass of brandy which quite improbably is of the splendid age and year that it is represented to be. These are actual experiences. A lady and gentleman went to a certain fashionable restaurant, and the gentleman had two small whiskies with soda. The charge made was fourteen shillings and sixpence, being two shillings for the soda and twelve shillings and sixpence for the whisky; the explanation being submitted on demand that the consumer could have had the entire bottle of whisky without extra charge had he desired it. Even in a grand *salon*, where it is not the rule to debit a person who desires a whisky-and-soda with a full bottle of the spirit, a charge of three shillings and sixpence per glass is made.

It is the old story of demand and supply. There is a demand for means of being extravagant. The hotel and restaurant proprietors know it, and they provide the supply accordingly. The majority of people who settle these bills make no protest. They are accustomed to them; they do not think about them. If anything, they are rather pleased at the charges, because they feel that they are living the luxurious life at its best. They know, at any rate, that they are paying as much as it is possible to pay for what they get. So, after all, judge upon the crimes of these *hôteliars* and *restaurateurs* with a touch of mercy, for they are not so much the cause of all this prodigality and waste as the effect of it. They supply a demand, and if they do it eagerly and to excess, and to their utterly unreasonable advantage, it is their customers who are to blame.

THE SERGEANT'S LUCK.

CHAPTER II.

BY this time our carts had all arrived, and I set the men hard at work to get in the fodder, leaving a special guard round the chest, which had naturally excited the men; and this was all the greater when I told them that I was going to get forty thousand pesetas for the contents.

As the vicar and I went towards the monastery he complained bitterly of the competition of the schismatic body called Recollecti, who had broken away from his monastery about a century before. He urged me strongly to pay his competitors a visit, as the unbounded wealth to be got at the expense of their monastery would well repay the trouble. As a mere soldier I could not understand a good deal of what he told me about these monks; but I quite entered into his suggestion, and said I would speak to my captain about it; and he half-promised me to come and show us where the monastery was.

By this time we had arrived at a gate. Listening intently, we could not hear anything of the dragoons; so he entered, leaving me outside. I learned afterwards that the dragoons had only got two large silver candlesticks, a silver lectern, and a few inferior pictures which the monks, to make them go, had told them were priceless masterpieces; so that really they had not done half so well as we had.

When the vicar returned he gave me a paper. 'This,' he said, 'is the bill on Alfonse Valdez, the great banker at Alicante, for ten thousand pesetas, payable to bearer. This bag,' he said, giving me a small leather one, 'contains another ten thousand pesetas in gold, and each of these three large canvas ones contains the same amount in silver.'

'All right,' I said after I had carefully examined everything. 'Now, the sooner we are off the better.'

In a very short time the monks had got the chest containing the statue, which they covered with hay, into a cart, and then drove off in one direction, while we, with our wagons heavily loaded with fodder, went off in another.

Naturally, as we returned, we were in high spirits, for forty thousand pesetas was a good *coup*; and after having gone a league, we halted at a *posada*. Then the old fox Viardot came out of his cart, having apparently quickly got rid of his malady; and the wine too loosened his tongue.

'Well,' I said to him, 'I think we have done a fine morning's work.'

'Oh, I had nothing whatever to do with it,' he answered. 'It was you and Sergeant Lafont and the two brigadiers who did it.'

'And, if we did,' said Lafont, 'I suppose you will take your share?'

'Well, *mes enfants*,' he answered dryly, 'as it

may be a case of a firing-party for some of you, I am not sure that I shall be in a hurry to do that.'

'A firing-party!' we exclaimed, aghast, the laughter dying from our lips. I remembered now the captain's peculiar manner, and how he had said that Viardot was to act on his own responsibility, and the way the old fox had tricked me into undertaking his duties.

'I don't understand what the deuce you mean,' I said warmly.

'Of course I am not certain myself,' he said; 'but I believe that those prisoners they marched in last night brought word that Marshal Suchet is only three leagues off, and we shall probably find him at Villena when we get back; and when the monks come and tell him about your little *coup* this morning, why, then,' he added with a knowing wink, 'you will understand about the firing-party. I've seen colonels degraded—ay, and men shot *sur le champ*—for far less than this. I've served under Suchet, and I know.'

Now I knew, of course—though he did not, as he had remained in the cart—that I had nothing to fear from the monks; but as he had been so very clever, I just let him remain in ignorance. 'Have you?' I said, greatly relieved. 'Well, I will just take the risk of the firing-party. But,' I added sharply, for I was nettled by his duplicity, 'as I am in command, I am not going to have any more drinking. We will get back, if we can, before the Marshal arrives.'

So, without more ado, we set off again, and when we got back we found that Suchet had not arrived. Our regiment had just returned from their reconnaissance, and I went straight to my captain, and took all the money to him, and also gave him the bill for ten thousand pesetas. To my surprise, he seemed very uneasy, and before I could explain anything he went off in a great hurry, saying he would speak to the colonel.

He soon returned, bringing with him the bill. 'You can keep the bill for yourself,' he said. In my innocence I was about to thank him profusely; but he went on: 'You and Sergeant Viardot have taken the forty thousand pesetas on your own responsibility. We may have Marshal Suchet here soon. I will swear I never told you to take it, so it must rest with you two.'

I was so much taken aback that I stood speechless. 'But, *mon capitaine*!' I expostulated, 'there is no risk of Marshal Suchet knowing anything; and I told him why the monks would keep the matter to themselves.'

'Why didn't you tell me this before?' he said.

'That makes all the difference.'

'You did not give me time,' I answered.

Then he went off again to see the colonel.

'He will do nothing with the money till Suchet has gone,' he said on his return. 'It's best to keep everything quiet.'

'And the bill, *mon capitaine* ?'

'Oh, the colonel says,' he answered with a laugh, 'you can keep that, because it's not worth the paper it is written on. Why, Alicante is occupied by the English. How are you going to get there? I did not give you credit for being such a fool.'

Bitterly I acknowledged the truth of this, and tried to banish it from my thoughts, for I had reckoned that with ten thousand pesetas Française could not possibly refuse me.

In spite of all I said, from the colonel downwards, Suchet's expected visit was the cause of great uneasiness; but, as it happened, we all had our fright for nothing, for on reconnoitring the following day we fell in with a column under General Louis Suchet, a brother of the Marshal. The amusing part of it was that his delay—for he had very different ideas from his brother—was due to the enormous amount of loot he had got. We had encountered him two leagues from our headquarters; but it actually took him two days to reach us, though this was partly due to so many of his horses and mules having died for want of fodder.

The welcome news that it was only the Marshal's brother who was approaching our headquarters allayed all our fears, and that evening the forty thousand pesetas were distributed, half going to the officers and half to the men; old Viardot, who had done nothing but put the blame on me, receiving two hundred and fifty francs, while I got but two hundred. However, after the distribution of the spoil, the colonel, whose conscience, I suppose, smote him, as he had intended to make me the scapegoat if it had been the Marshal instead of his brother who was approaching, sent for me.

'I am highly pleased, sergeant,' he said, 'with your conduct; and on the arrival of the General I shall strongly recommend you for a commission, as you thoroughly deserve it; and as they are greatly in want of fodder, your squadron will start again early with every available wagon to get more.'

Of course I thanked him, though I was not sure if I would accept a commission; and then I told him about the other rich monastery the vicar had told me of. His eyes glistened as I spoke, for the appetite comes with eating.

'Does any one know of this but you?' he asked.

'Not a soul, *mon colonel*.'

'Very well,' he said, 'keep a still tongue in your head; for if General Suchet hears of it he will go there himself. Once he has left we will see to that. You see the vicar to-morrow?'

The chief knew, of course, how he would rise in the estimation of General Suchet if he got him plenty of fodder; so we started very early

the next morning with an enormous train of wagons. When we got to our destination I found, alas! that the vicar had not returned; but I left word that our colonel desired to see him, and that if he did not come we would fetch him. When we got back the colonel sent some wagons on to meet General Suchet, who was much pleased at his forethought. On the day after his arrival Suchet held an inspection, and the colonel was as good as his word as regards recommending me for a commission.

'I would wish, General,' he said, 'to commend to your notice our *maréchal des logis-en-chef* as one deserving promotion;' and he told him about the hay, &c., I had procured.

'He's young,' replied the General, 'but he looks a likely fellow;' and thereupon he told his aide-de-camp to make a note of it. Of course I was proud of this; but still in my own mind I was undecided about the commission on account of Française.

Two days afterwards the General went off to the west to take up a position on our right flank, and to find out, if he could, what that very incapable Spanish General Blake was doing. With a sigh of relief we saw his departure. All we wanted now was the presence of the monk. Luckily he arrived the next day, and I took him at once to the colonel. The latter produced his maps; and, though the monastery was not marked on any of them, the Brother quickly pointed out the exact situation. To the disgust of our chief, it was but a league or two to the south of where Suchet was going.

'*Mille tonnerres!*' the colonel exclaimed angrily, 'the General is bound to find it. Why, we have no chance; we shall be too late.'

'I don't see that,' replied the Brother; 'those mountains to the north-west will take the General out of his course. You go west, but more to the south, and you will be on the other side of them. The holy spring by which the monastery is built is in such a retired position, even if he should hear of it.'

'Anyway, we will start to-night,' said the colonel; 'and you must come with us.'

'In that case,' replied the monk, 'you must supply me with a uniform, or a terrible vengeance would be taken upon me.'

Of course this was agreed upon. At ten that night the whole regiment was ready. Our squadron was in advance, and I, with the monk—whose name in religion was Sebastian, but whose real name was José de Goni—and two vedettes, went forward.

I had taken a great liking to José when I first met him; one could not help it, his keen, intellectual, handsome face, and his bright, honest eyes that twinkled with fun, would have won any man's heart, and, I should say, any woman's. I noticed at once, as we rode along, that he had a very good seat in the saddle, and I told him so.

'There should be nothing strange in that, friend,' he answered, 'as for a year I was a lieutenant in the Dragons de la Reina.'

Owing, it appeared, to the death of his brother he had been obliged to leave the army, and so went into business with his father. Rather against his father's advice—who said he would be sorry for it—while still under twenty he married a most lovely girl. There was not her equal for beauty in all the province. For two years he was inexpressibly happy, and then his father died. In the course of business he sometimes had to be away from home for several days. His father's death had been a great blow, but he was soon to undergo a greater, for on returning from one of his journeys he found that his wife had eloped. He never had the slightest suspicion of her fidelity. He was for a time—for he had *au fond* a very sensitive disposition—distracted with grief. Then the desire for vengeance got the better of him. It was not so much his wife he wished to punish, but the man who had robbed him of her. For two years his search was fruitless; then he got on their track, and they fled. But again he found them. To shield her lover, his wife received the fatal bullet that was meant for the man; but her devotion did not save her lover from another that went through his neck.

'Well, after that,' continued De Goni, 'though my vengeance was satiated, I was sick of the world and all its ways. I disposed of my business and my lands—I made them over to the monastery—and owing to the influence of an uncle I soon became the vicar; but,' he added, 'religion was not what you French call my true métier. I have too restless a disposition; there is no scope for my energies, and I tell you I am not going back.'

'Not going back!' I exclaimed, almost pulling up my horse in surprise.

'No,' he replied with a dry laugh; 'I am not a fool. After you left us that day the Superior—who never had any love for me, as he wanted his nephew to be sub-prior—ordered me and Brother Andreas to drive with him to a certain deserted place and bury the statue. We three, and we three only, were to know where it was. After we had finished our work my Superior brought out two bottles of wine, keeping one for himself and giving us the other. Before we started I was not very well, so I took some powder. Their efficacy depends on drinking nothing but water for twenty-four hours. I had not said anything about feeling unwell before, as it was really nothing much; but the prior seemed surprised and rather annoyed till I told him the reason. However, I suspected nothing; but an hour afterwards poor Andreas was taken ill, and in less than two hours he had terrible convulsions, and died in horrible pain. Now there are only two who know where that statue is, but it is not the

prior's fault that there are more than one. I had told him that I had suggested that you should pay a visit to our religious competitors, and this he thought a grand idea; and when we arrived at the monastery and heard you had been there again and wished to see me, he sent me off at once. For one thing, he did not want me to talk about the unexpected death of Brother Andreas, and he reckoned that by the time I came back the Brothers would have got over the shock; and then in his own time he could play the same Pope Borgia trick on me. However, he won't have the chance, as I'm not going to put my head in the noose. The monastery has got all my money, and they must be content with that.'

'But what will you do for a living?' I asked.

'I will never fight against my own countrymen; but I am going to ask your colonel if he can get me a commission in your army. If he cannot do so, I will go to France and enlist as a trooper. Anyway, I want to get right out of this country, though it is my own.'

'All right,' I said. 'I will speak to Lieutenant Finoy. I am sure he will use his power with his uncle.'

Thus we travelled many kilomètres.

'You see that thickly wooded ridge?' José inquired, for it was a fine moonlight night. 'We must make for a gorge in the middle of it, and when we come to the end we shall see the monastery beneath us. It is about an hour from here.'

On learning this I sent a vedette to my captain, who communicated with the colonel. The latter, along with the captain, joined us as we entered the ravine.

'Yes,' said our chief after he had examined the huge pile of buildings through his glass, 'this ought to be an easy matter.'

'If it should be successful, sir,' said José, who was near, 'will you grant me a favour afterwards?'

'Certainly,' the colonel replied, 'for you deserve it;' and then he gave the necessary instructions for the attack on the place.

The taking of the monastery was very quickly accomplished, but the loot was so enormous that some considerable time was taken up in securing it. As it was, our wagons would not hold it all, and the men rode back with gorgeous vestments on the pommels of their saddles; in fact, such a *coup* for a small body of men I had never known before, and it was impossible to estimate the value of our prize. It was not only the treasure, which we reckoned at one hundred and fifty thousand pesetas, but the pictures and vestments.

As we rode back I asked De Goni about my bill for ten thousand pesetas that he had given me on the banker at Alicante.

'My dear friend,' he replied with a smile, 'you must not reckon on getting a peseta. I expect that by this time my Superior has sent a

Brother off to stop the payment. The only way for you to get it would be for you to start to-morrow; though, anyway, I do not see how you could succeed even then, as Alicante is occupied by the English.'

'I feared as much,' I said; 'but it is very hard.' Then I told him of my love-affair, and how much my happiness depended upon it. I told him, too, how the colonel had offered me a commission, and that I was not really eager to take it; but that I did want to marry Françoise, and if I could only get the money I would willingly ask the colonel to give him the commission instead.

'I will be your friend for ever,' said José, 'if your commander will agree to that.'

Whenever I was in a difficulty my first thought was to see Lieutenant Finoy, and this I resolved to do; but I was saved the trouble, for that evening De Goni and I were informed that the colonel wished to see us. Surrounded by his *état major*, we found him at the largest house in the place. Evidently, from the flushed faces of some of the officers, they had been drinking rather heavily, but all were in the most uproarious spirits.

'We all feel,' said the chief as I saluted, 'that it is owing to you two that our success was due;' and amid shouts of approval he told us we were to receive two thousand five hundred pesetas each, for which we duly thanked him. Then he said to the ex-monk, 'You said you had a favour to ask.'

'I would rather,' replied José, 'that my friend the sergeant should tell you what that is.'

So there and then I did so, and at once the colonel agreed to allow us to go to Alicante. Moreover, he promised De Goni to do his best to get him a commission; and then, to our surprise and delight, he stood up and drank to our health amid loud acclamations.

The next morning we—I dressed *en civil*, and De Goni in his monk's garb—started for Alicante on a couple of mules. Though I spoke Spanish passably, any native could tell that I was a foreigner. The deadly hatred felt in Spain for Frenchmen prevented me from assuming that nationality; in fact, my friend impressed upon me that I must always speak of them among his countrymen as dogs and rogues. I had picked up a little German during the campaign of Wagram, and José suggested that I should pose as a German merchant, and, to put inquisitive people off the scent, occasionally speak to him in that language.

'Where did you learn German?' I asked.

'Learn it!' he answered merrily. 'My good fellow, I don't know a word, but I have heard the language spoken. I shall answer you in any guttural gibberish. There's not one in ten thousand in this country who knows more than I do.' So at any *posada* he always spoke of me as his German friend, Señor Hagg-

snuggé; and though the natives listened with astonishment to our conversation, as well they might, they suspected nothing.

In a careful manner, as we went along, we made inquiries as to whether a Franciscan monk had been seen going that way, and were relieved to find that no one had seen such a person. But, alas! our hopes were soon dashed to the ground; for, when we were but four leagues from Alicante, on turning a corner we saw a brown-robed figure on a mule trotting quietly along but a short way in front of us.

'*Caramba!*' exclaimed José, pulling up and staring fixedly at the apparition.

The rider's cowl was up—for the sun was very hot—and it was difficult to identify him.

'I can't be perfectly sure,' José continued; 'but I think it is Brother Giacomo. He's an Italian, and the deepest and most cunning rogue I ever met.' And he was right.

'What on earth shall we do?' I asked. 'Shall we wait till we get to the wood, and then ride up and bind him and leave him there?'

'No, no,' replied José; 'he would be sure to be found. And even if we got to the banker first, and out of the town with the money, he would offer a reward to every peasant and guerilla between Alicante and Villena, and we should never get back.'

For a time my companion remained in deep thought.

'Everything,' he said at length, 'depends upon whether he recognises you. If he does, Heaven help you! But, apart from that, you leave everything to me. But mind,' he insisted, 'you must know no French. He's as cunning as the Evil One if he has the slightest suspicion; and he will probably address you suddenly in that language, in which case stare at him blankly. Now come on.' And soon he hailed the monk.

'I was afraid I should never catch you after all!' cried José to the astonished Italian, who eyed him—and me too, for the matter of that—very suspiciously. 'Our Superior has sent me after you to say you are not, after all, to give his note to Señor Alfonso Valdez, as those dogs of Frenchmen say that if the bill given to that rogue of a sergeant is not met, they will either burn the place down or take the statue.'

The monk at first was too surprised to answer, and he looked at José and then at me; whereupon De Goni introduced me in a casual way as a German merchant he had met by chance.

'As regards what you tell me,' said the Italian, 'have you a letter, Brother Sebastian, from our Superior to that effect?'

'Of course I have,' returned José.

'Well, I should like to see it,' returned the other.

'Are you my Superior, Brother?' replied De

Goni haughtily. 'You forget yourself. You forget the rules of humility imposed on those who enter our holy order.'

'I meant no offence, Brother,' said the monk in a humble voice; 'but my orders were positive, and unless you show me that letter I shall certainly proceed. At any rate, I shall have carried out my duty to my Superior, and,' he added in a meaning voice 'to yours.'

'Well, I shall come with you,' said José; 'and if we lose our statue the blame will be on your shoulders.'

And then José began to talk to me in his sham German; though we soon fell into speaking Spanish again, and gradually the Italian joined in. Several times I found the latter gazing at me in a very peculiar way, and in my heart of hearts I felt certain that he had some suspicions, if he did not actually recognise me. In a casual

way he asked me my impression of the country, and remarked rather pointedly that, for a traveller, I had very little luggage.

'Oh, it's very important,' I answered frankly, 'that I should get a ship for Naples to-morrow, and my servant is following with my luggage. It is but a small matter if I lose the luggage compared to my catching the ship.'

Thus we travelled on, and reached the city just before the gates were closed.

'We must keep him in sight,' whispered José as we were seeing to our mules in the stable, while Giacomo was talking to one of the stablemen.

'I fear he knows me,' I answered.

'I think so too. In fact, I'm certain of it; and Heaven knows how it will end!' replied José.

(Continued in following section of this part.)

IN THE FALKLAND ISLANDS.

By JAMES BUCHANAN.

THE Falklands, the farthest outpost of the British Empire, are a lonely and little-known group of islands lying some three hundred miles off the eastward extremity of the South American continent. They number two hundred in all, but many are merely isolated rocks, their only inhabitants penguins or seals.

From the time of their discovery by Davis in 1592, the islands have borne an unenviable notoriety, and a convincing proof of their unattractiveness is the absence of any indigenous population. Imagine a dull, leaden sky hanging low over reddish-brown moors, out of which jut the ragged teeth of white rock-masses, and you have a general view of the landscape. This is a very Cave of Æolus. Mariners, to their cost, are aware that the boisterous winds which blow almost continuously are often accompanied by sudden and dangerous squalls. Night usually brings a cessation; but with sunrise the wind seems to imbibe fresh life, and blows with such force that riding, or even walking, is a matter of difficulty. In the summer months the prevailing winds are from the south and south-west; in winter they veer round to the north-west, and are much less severe.

The colony is substantially one vast sheep-run; and, no great demand for labour existing, already a considerable number of the rapidly increasing population have turned their attention to the neighbouring coast of Patagonia, where the climate and conditions are somewhat similar. The stock graze on the continuous tracts of undulating moorland covered with coarse, wiry, withered-looking grass, and the rich tussock, on the roots of which animals thrive amazingly; but the latter grass is rapidly disappearing, being now almost confined to the outlying islands. The pasturage

comprises two million two hundred thousand acres, and upon this area nearly one million sheep, principally of Lincoln and Romney Marsh strains, find sustenance.

The horses are a hardy, wiry lot, and, like the sheep and cattle, feed out all the year round. There are no trees, and ordinary agricultural crops are quite impossible. The soil is peaty and studded with treacherous bogs; the ground being so swampy, indeed, that there is not a four-wheeled vehicle in the islands. All travel is done on horseback; and, owing to the dangerous nature of the ground, liability to be overcome with fatigue, and a tendency to lose one's way through the similarity of the landscape and heavy mists which suddenly envelop the land, a stranger dare not go from one farm to another without a guide.

Whatever may be said of the inhospitable climate, the visitor will always come away with favourable impressions of the warm-hearted people. The crews of vessels buffeted and knocked about by the stormy waters of the Horn are always sure of a hearty reception, and not a few have thrown in their lot with the natives; while many of their dismantled hulks and fine sailing-ships in various stages of decay bear melancholy testimony to the relentless fury of the stormy Antarctic seas.

In spite, however, of being one of our most intrinsically insignificant possessions, with its gloomy, depressing climate, the group pays a remarkable tribute to the peculiar genius of the British race in the art of empire-building. The inhabitants are nearly all of Scottish descent, and indeed the colony is very much a slice of Scotland set in the South Atlantic. With a population numbering only two thousand three hundred and

sixty-five, the Falklands dispose of a volume of trade amounting annually to about three hundred and fifty thousand pounds. The finances are in a flourishing condition. The estimated revenue for the past year is twenty thousand and sixty-nine pounds, and the ordinary expenditure is estimated to be eighteen thousand two hundred and seventy-six pounds. There is no debt; and the assets are increasing, while the liabilities are diminishing. Personal as well as public credit stands high, for according to the latest report of the savings bank, the sum of thirty-one pounds ten shillings and sixpence is accredited per head of the population.

Wool and sheepskins account for the great preponderance of exports, the others being tallow, hides, sealskins, and whale-oil. Whaling is now successfully carried on here and in the dependencies of the colony—South Georgia and the Southern Orkneys—over one hundred thousand barrels of oil being exported last season.

The record of progress is not confined to material things. Though many of the adult population are illiterate, there are now four hundred and thirty-four children receiving tuition; but the scattered condition of the shepherd population renders it necessary to employ itinerant schoolmasters.

Notwithstanding the drawbacks of the weather conditions, the climate is very healthy, the annual death-rate per thousand averaging 6·02. The water-supply, which consists mainly of rain-water collected from the roofs of the houses, is very unsatisfactory; and owing to the absence of lime the people suffer a great deal from their teeth. This and minor rheumatic affections constitute the only sicknesses. Peat takes the place of coal, and most of the cooking is done in camp-ovens in the ashes.

Owing to their isolated position, travellers seldom visit the islands. They are dependent on the monthly visit of one of the P.S.N. Company's steamers for mails and supplies, and mail-day in Port Stanley, the only town, is a red-letter-day.

A peculiar feature of the islands are the stone rivers. These consist of enormous boulders, usually running through a valley, which in the distance might easily be mistaken for a mountain torrent. Darwin on his visit to the Falklands noticed these peculiar geological structures.

The islands form the breeding-haunts of vast numbers of sea-birds and wildfowl. Penguins resort here in thousands, while great quantities of duck roam practically unmolested around the numerous lagoons and ponds. Owing to the great quantities of grass consumed by the upland goose, the farmers, aided by the Government, are engaged in a war of extermination, and last year fifty thousand beaks were brought in and paid for at the rate of ten shillings per hundred.

At one time it was the intention of the Imperial Government to add the Falklands to the chain of fortified coaling-stations which have

become such a vital necessity to our colonial expansion, and as such the strategic importance of this Gibraltar off Cape Horn could not be too highly estimated. But the advent of the Panamá Canal has resulted in the dispersal of our South American squadron, and the Crown colony in question would appear to be destined to continue its career of seclusion.

Since 1833 the lawful claim to the Falklands has been a disputed point between Great Britain and the Argentine Government. The claim is revived annually, and is as persistently ignored. The colony has been the successive possession of France, Spain, and the Government of Buenos Ayres, and has been known under the names of Les Malouines, Islas de Malvinas, and Islas de Magallanes. Since 1842, however, when Captain Moody was sent out as first governor, there has been British administration.

It is of interest to read the view of His Majesty King George as regards the Falkland Islands, written in his diary during the memorable voyage of the *Ophir*:

'By far the best thing for England to do with the Falkland Islands would be to exchange them at once with France for New Caledonia. That island possesses an area very nearly the same as that of the Falklands, and it has become a source of perpetual danger and annoyance to Australia. The Falklands, on the contrary, if employed as a convict station would injure no neighbours. The climate is infinitely better than that of New Caledonia, and the situation and capacity of the islands would make them almost an ideal penal settlement. The exchange would benefit most nations, and the *amour propre* of France might be flattered by entering upon the possession of Les Malouines. The small sum that might be claimed as compensation for the few settlers in the Falklands would be a cheap price to pay for the riddance once and for all to our Australian fellow-countrymen from a perpetual and increasing menace to their peaceful prosperity.' This extract is taken from the *Falkland Islands Magazine*.

THE WOODS ARE SAD.

On a banni les lutins et les fées.

THE woods are sad and solemn nowadays
As through their long, deserted aisles one strays;
No more along the pathways does one hear
Soft elfin laughter echo in one's ear;
No more for us the fairy piper plays
A little laughing tune or magic phrase,
Some haunting strain to lure us on our ways,
Enthralling, mocking, calling sweet and clear.

The woods are sad!

No more do green rings on the grassy braes
Show us the chosen places where the fays,
The goblins, and the elves, in crowds, appear,
And dance on moonlight nights throughout the year.
'We are grown old,' a voice within us says;
'The woods are sad!'

SEVENTH SERIES

THE DEFEAT OF THE TURKISH ARMADA.

By PERCY CROSS STANDING, Part-Author of *Our Naval Heroes*.

LEPANTO was fought some seventeen years before Drake, Howard, and the other Elizabethan heroes destroyed the Spanish Armada; to be exact, the date was October 1571. It has been fully described as the link between old and new forces in maritime warfare, for Lepanto was the last great battle of the oar-driven vessel or galley. It smashed the naval power of the Turk at a moment when, having made himself master of Hungary and 'driven a wedge deep into Europe,' he looked with confidence to the mastery of the Mediterranean.

The Sultan Suleiman the Magnificent had died in 1526, to be succeeded by Selim the Drunkard, whose fleet was badly beaten by the Knights of St John in an attempt upon Malta. But by the year 1570 the Turks were threatening Cyprus, and they actually despatched a peremptory demand to the Doge of Venice for the evacuation of that island. The Doge and Senate hurled back defiance at the Ottoman, but in reality they shivered at the menace and appealed to the Vatican for help. The neutrality of the Venetian Republic had hitherto withheld Pope Pius the Fifth from forming a league of the southern European Powers against the common foe; but this direct appeal from Venetia could not be disregarded. The enemy were already besieging Cyprus, yet little or nothing was done by the Christian fleet which first took the sea under command of Prince Colonna, and the venerable Pontiff must have felt bitter disappointment. But, nothing daunted, His Holiness approached the rulers of Spain, Venice, and the lesser Powers, with the result that the famous treaty of the Holy League was signed, and a really fine fleet was got together. Who should command it?

The choice fell upon the twenty-four-year-old Don Juan (Don John) of Austria, who, albeit so young in years, had already commanded the fleet of Spain in suppressing the Moorish insurrection of 1570. Don Juan was the natural son of a mighty monarch, as other great warriors have been—notably the Duke of Berwick and at least one of the marshals of Napoleon. He was, in fact, the illegitimate son of the Emperor Charles the Fifth, by his mistress, Barbara Blomberg. Don Juan arrived at Messina on 23rd August 1571, to find three Christian flotillas assembled there—namely, those of Philip of Spain, of

Venice, and of the Papal Admiral Colonna. Otherwise the news was not good, for Famagusta in Cyprus had just been stormed by the Turks with every conceivable circumstance of barbarity.

The Spanish prince found himself at the head of two hundred and two galleys and seventy-six sailing-ships, having twenty-eight thousand fighting-men on board—Italian, Spanish, German, &c. He flew his own flag in the great galley *Reale*, of three hundred rowers and four hundred fighting-men. His principal lieutenants in command of this Christian armada were Colonna, Doria the Genoese admiral, Cardona, Santa Cruz, and Barbarigo the Venetian. It is a profoundly interesting fact that there was serving as a simple volunteer in the fleet one Don Miguel Cervantes de Saavedra, destined to deathless fame some thirty years later as the author of *Don Quixote*. It is said that Sir Richard Grenville, famous later on for his fight on the *Revenge*, was also present. Such incidents add a peculiar picturesqueness to history, and I cannot refrain from recalling in passing—though it has nothing to do with our story—that a later great sea-battle, when Rodney defeated De Grasse in 1782, was witnessed from the window of a convent school by a little girl named Josephine de la Pagerie, who lived to be Empress of France when Napoleon ruled Europe.

The hostile fleets were pretty nearly equal. That of the Crescent, commanded by Ali Pasha, and carrying twenty-five thousand soldiers under Pertev Pasha, counted two hundred and ten galleys and sixty-four lesser craft. On board of them, toiling at the oar under the lash of the taskmaster, were thousands of Christian slaves who had been carried into captivity in the various coast-raids of the Moslem hordes. Ali Pasha was confident of victory, and believed he had a marked superiority in force. But on 2nd October Don Juan determined to enter the Gulf of Corinth and attack the Little Dardanelles. For two days he was storm-bound; but on the 6th the fleet entered the gulf, having its enemy now not more than twenty miles away, just outside the Bay of Lepanto. At noon on the 7th the two armadas joined battle.

'Signor,' Don Juan is reported as having remarked to the veteran Colonna, 'you must put out all your claws, for it will be a hard fight.'

JANUARY 18, 1913.

[All Rights Reserved.]

This was said after the pilot of the *Reale* had reported the Turks to be in great force. As the galleys of the Holy League reached their fighting stations, the Christian galley-slaves (malefactors and others) on board of them were unshackled, given weapons, and bidden to fight for their freedom. It must have been an impressive moment when the young and dashing Don Juan, clad in complete armour, passed along the fighting line, crucifix in hand, entreating his officers and men to 'do their duty' to the holy cause they had embarked in. And black-robed Dominicans and gray-cowled Franciscans were busily exhorting the sailors and soldiers of the fleet to fight the good fight for faith and freedom.

One of the first shots fired in the battle was something of a good omen, for it crashed into the flagship of Ali Pasha and wrought great havoc. The confusion engendered by this incident gave the Christians somewhat of an advantage to start with, though all of their vessels could not get into action anything like simultaneously. A desperate combat quickly raged between the galley of the gallant Barbarigo and that of Mohammed Scirocco, who commanded the Egyptian squadron of Ali's fleet. In a desperate rush, as the vessels became locked, the Janissaries boarded. Unfortunately Barbarigo was fighting with his visor open, and he received an arrow in the face, which inflicted a mortal wound. His brave nephew Contarini was also killed. But now the Moslem boarders were repelled in a fierce and bloody onslaught, in which pike, sword, and arquebus all played their part. Mohammed Scirocco himself was slain, and this heroic counter-attack carried his galley by boarding. As her flag came down, the Christian slaves on her decks became free men and joined the fighting ranks of the conquerors.

For Don Juan's flotilla was already a winning host, albeit there was plenty of fight yet left in its swarthy adversaries. Some drove their galleys ashore on witnessing the discomfiture of Mohammed; but Ali Pasha, in his huge ship, with its white-and-gold pennon from Mecca, headed straight for Don Juan's flagship, the *Reale*. Then was seen a fight of heroes. Ali was supported right and left by Pertev Pasha and the Pasha of Mitylene; but Don Juan, on the other hand, was upborne on each side of the *Reale* by the Lion flag of St Mark on Veniero's galley and the Papal flag with its crossed keys on that of Colonna. As was the custom of the time, Ali's vessel crashed into that of Don Juan in the effort to carry him by boarding. The impact must have been terrific. It was Spanish arquebusier against Ottoman Janissary, and 'the range was a few feet.' For a while the Christian admiral was hard pressed, for the Turks fought like veritable demons. The decks were slippery with blood; the battle ebbed and flowed over the decks and forecastles of both ships. In repelling boarders, the brave Don Bernardino de

Cardenas was struck on the helmet by a ball, and died on the morrow, though 'he showed no sign of a wound.' Now the *Reale* was saved by the timely intervention of the Admiral Colonna, who, coming up on the other side of Ali's galley, completed her ruin. It was the turning-point in that glorious mêlée. Not one of Ali Pasha's four hundred Janissaries lived to tell the tale of blood. He himself either took his own life or was killed at close quarters, it is uncertain which. His gory head, stuck on a pike, was carried in triumph to Don Juan; but 'the chivalrous young admiral turned with disgust from the blood-dripping head, and ordered it to be thrown into the sea.'

Now it was that the author of *Don Quixote*, heading a party of boarders, received three honourable wounds, one of which cost him his left hand. As the result of about a hundred minutes' close fighting, the Moslem armada was half smashed, its commander slain, and its flagship captured. Don Juan caused the banner of the Holy League to be proudly displayed at the prize's masthead, with a fanfare of trumpets.

Meanwhile Veniero, the Venetian admiral, though handicapped by a wound in the leg, was rendering an excellent account of Pertev Pasha. The latter finally fled from the fight, with the loss of his own and other two galleys. Doria, the admiral of Genoa, was late in coming into the battle, but where the ultimate triumph was so overwhelming few were disposed to be hypercritical. At one time the flagship of the Knights of Malta was assailed by no fewer than seven adversaries, and was eventually boarded and carried, her commander receiving five arrow-wounds. At this point the fighting was particularly ferocious, since 'there were no enemies the Algerines hated so fiercely as the Knights of Malta.' But this capture was a last expiring effort of the enemy. The discomfiture of Ali Pasha enabled Don Juan and his captains to throw a preponderating force upon the remaining Ottoman galleys, which were quickly captured or dispersed. By four in the afternoon the routed remnants were making for Lepanto.

Such was the victory of the Christian over the Moslem armada. 'Don Juan's best trophies of victory were the twelve thousand slaves found on board the captured galleys. They were men of all nations, and some of them had for years toiled at the oar. Freed from their bondage, they carried throughout all Christendom the news of the victory and the fame of their deliverer.'

And the losses? Those of the Turks may be reckoned at from twenty thousand to thirty thousand men, while fifteen of their galleys were sunk and no fewer than one hundred and ninety captured! Their fleet had ceased to be a menace because it had ceased to exist. The victors had to mourn quite seven thousand five hundred dead, many of noble rank and the flower of

Spanish, Venetian, Genoese, and Maltese chivalry. Of the Venetians, Admiral Barbarigo and sixteen other captains of ships lost their lives, whilst sixty of the Knights of St John died that day.

In fine, such a *débâcle* of the Ottoman military power as was witnessed in 1912 happened to the Ottoman naval power as long ago as 1571. The death of Ali Pasha was a stroke upon which the Holy League's commanders especially prided themselves. He was a renegade, and by far the most hated of the Moslem admirals of that epoch. Originally a Calabrian fisherman, he had been taken by an Algerine pirate, had become a galley-slave, and had eventually put a period to this miserable existence for himself by embracing the Mohammedan religion and entering the Moslem maritime service, in which he speedily carved his way to high command. As it chanced, Ali did

not prove quite clever enough to lead the Crescent to victory over the Cross of his old discarded faith.

It may be readily comprehended that the moral effect of Don Juan's fine victory was stupendous. Reckoned on purely progressive lines, Lepanto may be said to have 'worthily closed the long history of the oar-driven navies. The galleasses, with their tall masts and great sails, and their bristling batteries of cannon, which lay in front of Don Juan's battle-line, represented the new type of ship that was soon to alter the whole aspect of naval war. So quickly came the change that men who had fought at Lepanto were present, only seventeen years later, at another world-famed battle that was fought under sail, the defeat of King Philip of Spain's Grand Armada in the narrow seas of the north.'

THE SHIP OF SHADOWS.

CHAPTER XI.—THE LITTLE ISLE.

THE next week was like 'awakening to the singing of birds on a summer morning after an appalling nightmare.

'Saint Pierre, the little outpost off the iron coast of Newfun'land, is a veritable tiny bit of seaboard of Old France whisked magically away and set in the great heaving bosom of the Atlantic. Here, on Saint Pierre and Miquelon, the last fragment left of the French transatlantic empire, were Norman, Breton, and Basque. Gay colours twinkled in the quaint and charming old-world streets. Rosy-cheeked women, many of them blue-eyed Norman types, chattered in the market, their cheery *patois* ringing musically; street-cries were tossed upwards to the clear air; the wharves were full of the bustle and excitement of merchandise and of those who do business in the great waters. Mingling with this modern voice, the *click-clack* of sabots rang and echoed along the streets, and creaking ox-carts trundled slowly past unchanged in form from the long ago, when the old French pioneers first called the place home.

'The bronzed men there live by a constant wrestle with the sea; but the note of the little town is one of indomitable cheerfulness, and the kindness of the Pierrois boundless. I can say no more than that it was equal to a Newfun'lander's, which you can arrive at by adding a planter's and an Arab's sense of hospitality, and multiplying the result by ten.

'We were woeful scarecrows when the *Julia* Johnson put us ashore, no doubt; but we got decent clothes, good food, and sound sleep. These worked marvels. The sailor is a resilient, with fewer cares ashore than landmen; and in a week, except the mate, we were all fit for the sea again. It was the heart of summer in the

dear little isle, and I, for one, could have dawdled long enough in the brilliant June days with the pleasant Pierrois. But we couldn't stop there for ever, and soon the captain and his wife arranged for a passage to St John's, where he was known. The rest of us were to wait where we were until his return.

'All the men—and, what was more wonderful, the women—had gone crazy over the skipper's wife. The story of the wreck touched the kind islanders, the girl's beauty and the radiance of her presence winning hearts every day. She looked a frail flower to have been exposed to the daunting days we had seen; but she was soon out by her big husband's side, with a smile for every one—maybe just a glance for Lowden; and every day she nursed Hulse, and helped the little French doctor to set him on his feet again. In a week she was princess of the place, and when she and her husband sailed for St John's there was a crowd on the wharf to give her a loyal send-off.

'Lowden, I remember, stood at the wharf, after the crowd dispersed, watching the vessel disappear into the sunset; and every day after that I saw him haunting the harbour, glowering at the horizon, watching for her return. He was still the same silent man. Scarcely a word could be got out of him. Though we had been comrades in extremity, and he had showed himself to be a prime seaman and a man of rare courage, we gradually ceased trying to humanise him. I watched him often in his solitary wanderings; but the man was unapproachable, and desired no company but his own thoughts, whatever they were.

'“But how sad!” quoth the old French fisherman with whom he lodged. “This poor

one, many a night he walks about and speaks—oh, but yes!—continually to himself. He is of the mind disordered. It is that he is in love or has lost money."

"Perhaps he is ill, Jean," said I, willing to listen.

"Nay; he would speak more were that so. For your English sailor-man speaks and swears more when he is ill. No; it is that he has lost money or he is in love. But yes, a grand passion. I'm old and I remember. I know the truth of the saying, 'Women and the purse keep men awake more than the toothache.' I have not my—what you call it?—my experience from books. *J'ai vécu, et je le sais.*" He finished his *petit verre*, his gray head nodding sapiently.

"The mate was under the doctor's hands with his broken ribs, and the youngster Callander basked in the bright eyes of Mathilde, a black-eyed maid at an *auberge* by the harbour, where he consumed much Calvados, and made love in a desperate jargon of Scoto-French, so that Evan and I saw a good deal of each other. As usual, Evan drank more rum than was good for him; but I sometimes got him away to tramp over the isle, and then we would discuss the situation.

"We were the only two of the ship's company who guessed the past chapter in Lowden's life, except, of course, of the girl.

"I'm in two minds now whether we shouldna be givin' the Old Man a ceevil hint," quoth Evan to me one day. "But, man, I'd as lief meddle wi' an infairnal machine as yon man Lowden. It's chust touch an' go wi' his reason, I'm thinkin'. He's a fine sailor, I grant ye; but he'll land in Gartnavel Asylum if ever he sees the Clyde again. I've been crossed in love mysel', the wance or twice; but a bottle or two o' whiskey got my mind aff it," he continued easily. "Well, well! we'll see what we'll be meant to see; but it's tamned awkhward. I hope he'll get some ither ship, for a schooner's too smahl for him an' me."

"Love and a fire won't hide, Evan. Leave matters alone," I would counsel. And so on. Thus often did we commune when he and I wandered over the islet together. But our speculations left us where they began—no wiser, a little more befogged if possible, concerning the old-young problem, one woman and two men.

"I couldn't stop long in one place in those days, and I wasn't sorry when sailing orders came. One evening, following the lead of the loiterers on the quay, who were looking seaward, I saw a schooner making the entrance to the harbour. There was much chattering concerning her among them, and spying through glasses. She was evidently not one of the habitués of the port, for none of the crowd knew her. She was fore-and-aft rigged, with a green hull and a white band."

"*The Ayrshire Rose!*" I interrupted.

He nodded and went on. "That's so, only that wasn't her name then. The *Honorine* she was called, with the figurehead of her namesake, a blue-eyed Norman lass. The schooner was a dream—a perfect dream! A fine model, every one agreed. That night she was berthed, and Captain Gerrand and his wife came ashore. He had bought the smart little ship out-and-out, and had come back to ask us to sail her home in ballast to the Old Country.

"We all jumped at the chance except Callander. He hesitated when the Old Man tackled him, and made excuses, going red and white like a schoolgirl.

"Weel, weel, ye can bide if ye like. I suppose there's a lass in it! I'll sail without ye; but I thought ye had the makin's o' a sailor," quoth the discerning skipper.

"We were told off to get the ship ready for sea."

"Next day Evan stopped me on deck, a gloomy frown altering his usual can't-be-helped expression. He was carrying a paint-pot. "There's some fowk," he began, "that gang their lives seekin' for trouble."

"What's up?" I asked.

"Look," he said. He held the paint-pot at arm's-length, as if it had been some venomous reptile. "The Old Man iss goin' to chainge the name o' the ship, no less. I'm under orders, o' course; but ye wad think that we have had enough o' the bad luck an' chances o' a wet burial to last us for a score o' voyages."

"I've had enough to last me for the rest of my life," I said; "but I don't think it matters much, this changing of her name, does it? I want to get home, and I'll risk it."

"Wha-at! Iss it chainge a name is no hairm? Efferypody knows that it means the worst o' the ba-ad luck. There wass nossin' wrong about the name, bar that it wass French. The Old Man, he calls me aft, an' says he, 'Evan, you will pe a handy man at odd jobs. Can you pent—I mean pent letters?' says he. Oh, but I wass the fool! Like an eejit, I said that I thought I could. 'Well,' says he, 'I'm thinkin' o' rechristenin' the schooner. She's a jewel o' a ship,' says he, 'an' I'll pe goin' to chainge her name to *The Ayrshire Rose*, after my wife. Ye'll alter it on the ship an' the buoys.' His wife wass standin' beside him, smilin' an' lookin' for ahl the world ass if she wass gettin' a present o' a diamont necklace. What could I say? I chust stood an' glowered at him. So here I am goin' to do the cursed job. Ba-ad luck! Man, I mind on the *Clara Hall* that had her name chainged, an' the *Mastiff* too, an' the *Shetland Maid* that caught fire, an'—"

"W'atcher loafin' an' chatterin' abaht dahn there?" came the cockney pipe of the mate.

"Evan went off, and when I next saw him he was dangling over the side smudging the name

out moodily. Next day there duly appeared the schooner's new name,

*The Ayrshire Rose,
Glasgow,*

on the stern.

'We said good-bye to the kind-hearted Pierrois; and, to complete Evan's gloom, the voyage, like our last one, began on a Friday.

'Everything promised well. The sun shone royally. We had a steady breeze, the schooner making a good nine knots, and all of us were in

the highest spirits at the prospects of home. The contrast between *The Berwick Law's* last voyage and the sparkling weather we were having combined to make us as cheery a ship's company as could well be imagined. Of course, I don't count Lowden in this. Indeed, he was almost forgotten in the general exhilaration.

'The tranquil and sunlit days slipped past, *The Ayrshire Rose* sailing like a gull, every curtsy of her bowsprit to the clear sky telling us "nearer home."

(Continued in following section of this part.)

ELECTRICITY IN THE FUTURE.

By R. D. SUMMERFIELD.

IT is always interesting and often useful to try to forecast the future, and of all problems of the future that of electricity is perhaps likely to concern us the most, for it seems quite reasonable to expect that in time the greater part of the lighting, heating, and power-supply of the civilised world will be provided by this agency; although before this can come about radical changes must take place in the methods of producing electricity, and also in the manner of distributing and using it.

Electricity—which some people believe to be actually life, and the base of all matter, if not matter itself, and which, as far as we can judge at present, pervades all space—is the only apparently exhaustless source of power which is to be found everywhere and at all times. Our other sources of power, lighting, or heating are all more or less limited and local.

Coal, the principal agent, is widely distributed over the world; but there are enormous areas where it has not been and is not likely to be found, and whither it has to be conveyed at considerable cost; and even where coal is found in large quantities, as in this country, it has generally to be brought up from great depths at a cost which is likely to increase as time goes on.

Wood, perhaps the earliest source of power known to man, is now distributed in sufficient quantities very locally; and although it can be continually renewed and even increased by careful planting and forest supervision, yet in most localities its large bulk and low heating value render it much dearer than coal.

Mineral oil, destined to be the great rival, if not the supplanter, of coal in the near future, is widely distributed, and new oil-fields are being discovered nearly every day in various parts of the world. Crude petroleum either flows to the surface like a spring or can be pumped up, and is thus got to the surface very cheaply; but once it is there, the handling of it and the trans- forming of it into cleaner grades of oil render it dearer than coal at present for most purposes, in spite of its higher calorific value.

Coal-gas as a source of power depends of course on coal, and on certain kinds of coal; but as coal-gas made on a large scale and with proper precautions for the recovery of the by-products is already more economical to use than the raw coal itself, it is probable that in urban districts gas will soon be used to a very large extent in place of coal.

There is of course natural gas, but this is too local to be considered as a source of power.

Running or falling water, solar heat, and the tides are all local or irregular; and wind-power, although to be found everywhere, is too irregular both in force and duration to be of any great use.

Electricity is the only power known to us at present which can be obtained everywhere—at the top of mountains or the bottom of mines, on the ocean, in the desert, by day or night, in the Tropics or at the Poles; and the smallness of a space appears to make no difference in the amount of electricity which can be generated in it. But unfortunately electricity cannot yet be correctly described as a prime source of power except for small amounts; it must be produced by the aid of one or other of the original agents mentioned above.

We can produce electricity in various ways: by primary batteries of various kinds, by friction, or by heat; but to obtain commercially anything more than very small quantities we must employ the dynamo-machine—that is, we must take a mass of iron, wrap it round with insulated copper bars or wires, and revolve it at a fairly high speed in close proximity to a similar mass of iron and copper. We have learnt that by giving these two masses of metal particular shapes, suitably insulating them from each other and from the earth, and making the air-space between the fixed and revolving parts as small as possible, we can produce electricity, or rather collect it out of space, at any voltage or pressure we choose, the only limitation being our inability to keep it from breaking loose at very high pressures. We can also produce the electric current with various characteristics, such as continuous or alternating

current; but in any case we cannot produce electric current of any kind by means of the dynamo without expending more energy in the form of mechanical power to turn the machine than we get out of it in the form of electricity.

Now it seems hardly consistent with the economy of nature that in order to get a portion of this omnipresent and inexhaustible energy we must consume a larger portion of a local and by no means inexhaustible energy—that is, if we rely on our principal sources, coal, oil, or water; and no doubt in the future this clumsy system of collecting electricity will be superseded by apparatus which requires no power to drive it, or only sufficient power to make up losses.

It may be that Benjamin Franklin was nearer the solution with his kite and key than we imagine, and that in the future we may attract our electric current to receivers placed on the top of high towers. The first hints as to the construction of such receivers will no doubt be conveyed to us by phenomena connected with receivers and transmitters at wireless telegraph stations, as the electricity used for wireless telegraphy is the same as that collected for power or lighting purposes, but used under different conditions as to pressure and periodicity; and if we can now tune-up a receiver to collect the waves or vibrations of electric energy generated a hundred miles away, and make them do work, it seems reasonable to hope that some day, instead of first collecting and intensifying the waves of electricity by means of a dynamo-machine, and then transmitting them by special apparatus, we shall hit on the way to make a receiver which will collect them out of space directly.

It is, of course, already possible to draw electricity out of the air by means of a lightning-conductor; but a conductor is needed which will draw the current not only in times of thunder-storm, when the atmosphere is overcharged with electricity, and therefore very ready to give it up, but also in normal times, when the electricity is more evenly distributed. In addition to the receiver and conductor, it would probably be necessary to have some apparatus in the nature of a transformer to lower the voltage and increase the current, and possibly also some form of secondary battery or storage apparatus to act as an equaliser for the secondary current.

When it becomes possible to do away with the dynamo, no doubt the large central power-station will be done away with also. With no questions of coal or water to consider, it would be more convenient and probably cheaper to have a number of small receiver stations than one large station; and, in fact, the time might come when all works would have their own receiver or group of receivers, and when every house over a certain size would be fitted with a receiver and provide its own electricity for lighting, heating, cooking, and other domestic purposes.

The above suppositions doubtless carry us very far into the future of electricity, but how far it is impossible to say. At any moment an accident or the thought of some investigator may put mankind on the right way to discover the method of producing large quantities of electricity without moving apparatus or costly batteries. Before this stage is reached, however, we shall probably have discovered some cheaper form of dynamo and a more economical method of driving it. It may be found commercially possible to substitute some cheaper form of winding for the copper, and to reduce the whole weight of the machine for a given output without reducing the present efficiency, and the direct generation of very high voltage current will become more and more common. As regards greater economy in driving, the Diesel type of oil-engine perhaps promises best at the present time, and it will no doubt be used extensively in the near future. It is possible also that some successful method may be evolved for utilising the force of the tides; while power-stations depending on coal will tend to move nearer and nearer the coalfields as the practicable transmission of voltage increases, until the colliery and power-house are combined, and the coal brought from the pit goes direct to the furnaces of the boilers, the whole output of the colliery being sold as electric current instead of coal. This might be done at present in many cases with very great advantage. No doubt large electric power-stations will be erected on oil-fields as well as at coal-mines.

As to the transmission of electric power from the generator to the motors, lamps, or other apparatus, it appears very probable that we shall shortly be able greatly to reduce the weight of copper required for mains, and in some cases to do away altogether with transmission cables. The pressure at which electricity is generated and transmitted is certain to increase, and it may be found more economical to transmit the current through soft steel wire-ropes than through copper wires; but wireless telegraphy appears to open up the possibility of doing without wires at all in some cases.

It is now an everyday fact that the small currents required for telegraph work can be transmitted without wires for distances of hundreds of miles, while larger amounts of electricity capable of actuating motors and moving considerable weights have already been transmitted without wires for short distances. This being so, it seems quite likely that one of the first radical changes in electrical engineering practice will be wireless transmission of power, the question turning on whether it is cheaper to put in a receiver or run a length of cable.

Probably one of the first results of this change will be the abolition of direct contact between the trolley-pole of electric tram-cars and the overhead wire, the trolley-pole being replaced by a vertical pillar extending to within a few inches

of the overhead wire, and provided with a receiver at the top, this receiver being tuned-up to synchronise with the current in the wire. There would then be no necessity for two overhead wires on a double tram-line, and the single wire might be made lighter in section and carry a current at a much higher voltage than at present; and this single wire, which would require no switches or complicated suspensions at corners, would very greatly simplify and cheapen the overhead equipment for tramways and light railways, besides improving the appearance of the streets.

Wireless transmission of power will be even more important in the case of railways than of tramways. In works and factories, wireless transmission will no doubt at first be carried out by taking a cable from the generating station into the works and connecting it to a transmitter, the motors and lighting transformers being fitted with receivers suitably tuned. One result of this will be that a number of small motors will be used in place of fewer large ones, as there will be no internal wiring to be carried out.

From the time that it becomes practicable to transmit power without wires at no greater cost than at present, improvements will follow quickly and the cost will decrease, while the distance over which power can be transmitted will continually increase. Wireless transmission would, among other economies, save the cost of way-leaves, as it is difficult to see how a landowner could prevent, or charge for, electric current passing through the air over his property; but he might get his current for nothing by putting in motors and receivers tuned to the required pitch. No doubt at first a good deal of current would be stolen in this way; but as it is very probable that in time the State will control the production and distribution of electricity, it would soon become as difficult to run a motor without paying for it as to maintain any other

illicit practice. This presumes that the current is obtained from a power-house or receiver station belonging to the State; but should it ever come to pass that practically every householder could collect his own electricity, then the actual cost of the current would be little or nothing. The State would still draw revenue from the erection and upkeep of apparatus on private premises; and no doubt the user would be taxed on the capacity of his plant or the amount of current he consumed, if it were so arranged that he could make use of no current except that which passed through a sealed Government meter.

Should it ever become possible to obtain and use electricity in a cheap and simple manner as sketched above, a very great change would be wrought in our methods of locomotion, driving of works, industrial processes, and domestic economy. Ships would cross the seas carrying no fuel, but drawing their power out of space as they went along; locomotives and tram-cars and private motor-cars would perhaps also get their motive-power in the same way. Smoke would disappear, and with it most of the grime and dirt of our manufacturing towns. The general health of the community would improve, and woman's lot in the house become vastly easier with a plentiful and practically free supply of power laid on for lighting, heating, cooking, sweeping, washing, and other household requirements.

Such a state of things appears too good to be ever likely to come about, and it may be that it will never be possible for us to draw electricity direct in any quantities from space without moving apparatus, owing to continual variations of the positive and negative atoms of electricity, if they may be so called, to their continual regrouping and density in any particular space, or to various other causes; but, again, it would not be safe, in the light of the great strides which science has made in less than the last hundred years, to deny that the advances in electrical science as outlined above are possible.

THE SERGEANT'S LUCK.

CHAPTER III.

A GOOD meal rendered us rather sociable and less suspicious, and so, by mutual consent, in the cool of the evening we went for a stroll in the Alameda of the beautiful town, where I saw a good number of English soldiers and sailors. Perhaps the bright moonlight had something to do with it; but, for the size of the place, the number of beautiful girls seemed to me extraordinary; and from their frequent, if furtive, glances, my companions seemed struck by it too. Indeed, individually, I fancy we all wished we had been alone.

'I think,' I said slyly, as two dark-eyed beauties took their seats opposite to us and

commenced some mystic operations with their fans, 'that, to avoid the temptation of the world, the flesh, and devil, we had better go home, where we can smoke, and have some wine, and play dominoes.'

'Yes,' replied the Italian, 'I think so too;' adding thoughtfully, and speaking more to himself than to us, 'I never can make out why the devil is always depicted and spoken of as a man instead of a woman.'

However, neither José nor I tried to offer a solution to that problem, being too intent on thinking how we were to act on the morrow; so we rose and went back to the inn.

Had De Goni been sufficiently well educated to speak German, we might have been able to arrange some plan for our common action; but, alas! as it was, we were helpless, and could only trust to luck for defeating our cunning and deceitful opponent. Without saying a word, we both knew that if we could but make him drunk we should gain our object, and I bought a skinful of wine, sufficient to put half-a-dozen men under the table; and with assumed bonhomie we commenced to play.

Of course, from habitude, the two monks could carry a large quantity, but they knew their limit as well as I knew mine; and though they tried to egg each other on, and chaffed one another on their abstemiousness, neither of them would go beyond it. Thus, while we smoked and drank, and played mechanically, our thoughts were far away. What we all three knew, but hesitated to express, was that the hours were going by and we must take some action.

Suddenly beneath us we heard the '*Sanctissima Maria*,' &c., of the watchmen going their rounds, and the clocks struck midnight, whereupon we agreed to go to bed.

José gave me a lightning glance, and I dragged my mattress across the door, and folding up my coat, which contained the bill for ten thousand pesetas, used it as a pillow. We pushed the table under the window. The street was so narrow that it would have been almost possible to shake hands out of the window with a person at a window on the opposite side; so, when we began to play and drink, though we left the window open, we closed the shutters, as my companions were hardly engaged in religious exercises. But now, owing to the stifling heat in the little attic, we opened the shutters and blew out the candles; though we found we had almost as much light as before, as the moon came streaming into the room.

After my companions had gabbled some prayers they threw themselves on their mattresses, the Italian opposite to me, and José at right angles, with his feet to mine. With my pistol ready in my belt, I grumbled something about the heat, and pretended to fall asleep. As the moon came right into the centre of the room both the monk and I were in the shadow, and could not see each other distinctly. At any cost I knew I must keep awake. When I heard one o'clock strike, two men came into the next room and began to quarrel; then that ceased, and I heard two o'clock strike. José, though he had pretended at first, had now, I felt certain from his breathing, really fallen asleep; but it was not so with the wily Italian, though he was too preternaturally still.

During the whole of the last forty-eight hours—and very trying ones they had been on account of the heat—I had barely had eight hours of rest. Don José, as I have said, had fairly suc-

cumbed. Do what I would, I felt I could not hold out much longer. I was only enabled to combat the overpowering feeling of drowsiness that was overcoming me by the knowledge that if I yielded to it, with such an unscrupulous rogue so near me, I should never wake again. In spite of my resolution, however, I should have gone off but for one lucky circumstance. The mattresses in those parts are filled with dried seaweed; consequently the slightest movement makes a rustle. It must have been about three o'clock when providentially I heard a slight noise, and in a second I was myself again; but I remained as still as a mouse. Then I saw the monk—for the moon had gone round, and luckily for me its light fell right upon him—draw himself up very gently and cautiously look in my direction. My pistol was in my belt, just on my hip, and I gripped it firmly with my right hand. Having satisfied himself that I was really asleep, he rose very softly, and as he did so I caught the bright gleam of a dagger in his right hand.

'What are you doing!' I shouted, cocking my pistol and covering him with it.

He was so taken aback that for a moment he hesitated, slipping his weapon up his voluminous sleeve. 'Nothing,' he replied, with assumed calmness. 'I wanted to close the shutters; the moon keeps me awake.'

'You don't want the dagger you have got up your sleeve to do that. You move and I fire.'

José had been awakened at once, and had cautiously risen. He was rather behind the monk, whose gaze was fixed on me. Without a word he threw himself on the Italian with such force that he knocked him down. In strength and activity they were very evenly matched. Then commenced a frightful life-and-death struggle between them. Over and over they rolled on the floor, José intent on getting hold of the Italian's wrist to prevent him using his *puñalica*, the monk intent on throttling him.

'Stun the devil!' gasped José, as the Italian had nearly achieved his object.

This was just what I was trying to do, but it was a very difficult matter, as, for a second, one was on the top, and then the other, and José might have received the blow; but at last I saw my chance, for they had rolled up against the wall, with the monk uppermost for the moment. Throwing myself on my knees to prevent the recoil, I dealt him a blow on his shaven head that quieted him, for his grip relaxed, and José quickly freed himself.

'*Cielo!*' the latter gasped in relief, wiping the perspiration from his forehead, 'I thought I was finished; but, *hombre*,' he continued, 'it seems to me that he's done for.'

It certainly looked like it at first as the moon shone on his ashen face, and I knelt down anxiously and felt his heart.

'No; it's all right,' I whispered.

'Very well,' replied José, *sotto voce*, 'we will get his letter from the Superior.'

This was soon found. Then we bound the monk hand and foot with the cords from his waist, and slipped a handkerchief into his mouth; and while he was unconscious we arranged matters—namely, that at nine o'clock I should go to the banker, while José remained in the room. That the banker should have no doubts, José, as vicar, wrote a letter for me to give to him, saying that by warning the community of the approach of the French dogs I had conferred a great and everlasting benefit on them.

Gradually the dawn broke and the cocks commenced to crow. From the neighbouring churches the deep-toned bells began to ring, and then below we heard the tinkle of the goat and mule bells. By this time the monk had become conscious, so we removed the gags and poured a little wine down his throat. I don't know what he had been before he took to religion; but, instead of thanking us, he cursed and swore in a way that would make a monkey blush, and his eyes flashed with such impotent vindictiveness that we hastily stuffed the handkerchief into his mouth again.

After José and I had taken turns to go down and get some chocolate, I set off to the banker's; and when he had read De Goni's letter and examined the bill, without the slightest hesitation he paid me the ten thousand pesetas. He told me he could not possibly give me the money in gold; but, what was next best, he gave me ten notes for one thousand pesetas each on the Banco Real.

When all was ready, after tightening the monk's bonds and seeing that the handkerchief was secure in his mouth, we locked him in. We told the *muchacha* that our friend was unwell and desired to sleep, and that he was not to be disturbed till we came back; and in order that she might the better carry out our instructions we gave her some silver.

It did not take us long to get our mules; but before leaving the town José said he must buy a brace of pistols. I insisted that I should buy a pair and make him a present of them, and went into a good shop, while he went off to get some wine and bread. I asked for the very best weapons, and the man showed me a couple similar to those he had sold to an English officer the day before; and from him, as he was very talkative, I got all the particulars I wanted as to the number of English troops in the place. Indeed my going into that particular shop was a perfect piece of good luck.

While we were in the town, and also for the first league outside, we rode slowly, so as not to excite suspicion; but as soon as we could, we got the utmost pace out of our mules. In case we were followed, to put our pursuer off the scent we invariably asked any chance *arriero* or traveller we met the way to Monovar, a place a little to the west of Elda—where, of

course, we had not the slightest intention of going.

Thus we rode for nearly three hours. The heat was becoming unbearable, and when at last we saw a forest ahead, where the road to Monovar really turned off, we determined to rest. So, leading our mules a little way into the shelter of the trees, we sat down in the welcome shade and had a good meal.

'Now, De Goni,' I said, taking out the bank-notes, 'these are what the banker gave me, and you must take half of them.'

This he absolutely declined to do, saying that I had procured him a commission, and that it made us level. I would not altogether admit this, as the commission had not really been gazetted, so I got him at any rate to take one thousand pesetas. Then we sat smoking and speculating as to what the monk would do when he got free, and whether, if he followed us, he would really go on to Monovar.

'I'm pretty sure,' said José, 'that he won't follow that false scent; but, anyway, let us go and look down the road.'

Nothing could we see but a few gipsies and a peasant or two going away from us. Then suddenly, coming at a good pace towards us on the crest of a slight hill, we saw three figures.

I took out a small glass I always carried. 'Caramba!' I exclaimed, 'there is the monk, with two horsemen, one on a brown horse and the other on a gray. I'm sure it's he. How soon he must have got free!'

'Yes,' replied José bitterly, after gazing intently for a time, 'that's Brother Giacomo, sure enough. Let us go back a little and lie on the ground. Now we shall see if he will fall into the trap.'

With our hearts beating, we lay still as mice in a thick clump of underwood near the corner of the road.

'Now that's the way to Monovar,' said the Italian, who seemed to be in none of the best of tempers, to his two companions. 'I don't believe they have taken that road; but you two ride up about half-a-league and see if you can hear anything of them, and ask every one you meet if he has seen them. If you do come upon them, greet them with civility as fellow-travellers, and then, when you see your chance, shoot them in the back. You are sure that you know them?' he continued.

'Oh yes,' replied one of the men. 'I saw you with them last night.'

'Well, remember, it was that accursed rogue of a Frenchman who got the money, and there will be five hundred pesetas for each of you. Meanwhile I will jog along quickly towards Villena.'

José and I exchanged glances as we heard this very pleasant arrangement.

'Now,' whispered De Goni as the three separated, 'you go along and see, if you can,

how far they go, and I will see what Brother Giacomo is up to.'

I soon found, however, from the nature of the ground, that my mission was useless, and I was returning, when I was suddenly startled by the report of a pistol. Rushing forward, I met José with the dead body of the monk on the latter's mule. It appeared that he was watching the Italian through the trees, and saw him get off his mule either to rest or to wait for the others, and seat himself at the side of the road. His back was to José; but when the latter trod on a stone and nearly stumbled, the monk stood up, turned round, and saw him.

In a minute the monk would have been on his mule again and have escaped.

'You would have stabbed me in the dark; you would have shot me in the back, you dog!' shouted José, rushing at him; 'so take that.' And he shot him through the heart.

Taking the body farther into the wood, for a

while we left it there, and then made our way back to the corner of the road to await the arrival of the horsemen, and fully half-an-hour must have passed ere we heard the clatter of their horses.

'I am half-inclined,' said one of them, 'to go back, only one does not get five hundred pesetas every day.'

'Five hundred pesetas!' repeated the other with a hoarse laugh. 'Only let me get the chance of a shot at that devil of a Frenchman and I'll have five thousand, and you're a fool if you don't have the other five. The Brother may catch us when he can.'

'But I am tired, and so is my horse,' replied the first speaker.

'Well, we will catch up the Brother; and if we don't find them or hear anything by the time we get to Sax, we will come back.' The other agreed to this, and they both set off.

(Continued in following section of this part.)

PRICES IN BURMA FIFTY YEARS AGO AND NOW.

By F. N. BURN, Rangoon.

FEW British possessions have improved so quickly and regularly as has Burma. We acquired Moulmein and Akyab after the first Burmese war in 1824, when Rangoon, the more valuable port, was also captured by Sir Archibald Campbell's forces, but was given back to the Burmese on the conclusion of peace, to be retaken and kept at the second Burmese war in 1852. The Arakan and Tenasserim divisions have thus been British possessions for eighty-six years, Rangoon and the Pegu division for fifty-eight years, whilst Upper Burma was annexed at the third Burmese war in 1886, on the capture and dethronement of Thebaw, the last of the Burmese kings. After each of these annexations the trade and population of the captured places increased enormously; and the Burmese, although they had a fondness for royalty, showed no wish to live under it, preferring the more equitable rule of the foreigner and the peace and security it brought about. The trade was almost confined as regards exports to two articles—teak-timber and rice. When there was a brisk demand for these two articles the import trade thrived to an extent unequalled in any Indian seaport; for the Burmese, unlike every Indian, eagerly went in for novelties when they had the cash, and would individually spend more on dress and jewellery than the inhabitants of many an Indian village.

Prices of most articles have risen greatly in the past fifty years. The best teak sold in the 'sixties of the last century at from forty-five to sixty rupees (three to four pounds) per ton in Moulmein. First-class teak now commands one hundred and fifty rupees (ten pounds) per

ton in Rangoon, and exceptionally good pieces even larger prices. Teak is largely used in house-building in most parts of Burma; although brick buildings are now insisted on in parts of the larger cities, as being less liable to take fire. But those who have lived in both descriptions of buildings say that for the Burma climate, with its rainy season extending between May and September, there is no more comfortable dwelling than a teak bungalow roofed with teak shingles. It gets hot in the afternoon, but even in the hot season is often cool half-an-hour after sunset; and there is usually some part of the house fairly protected from the afternoon sun, where it is cool all day. These bungalows are built on posts raised from five to ten feet off the ground. Fifty years ago, when teak was cheap and plentiful, the posts used were often whole trees in the round, it being cheaper to use whole logs than to square them at the mills into posts. Some of these bungalows still exist in Moulmein, showing the lasting qualities of this admirable wood, unaffected by the change of climate and often impervious to the attacks of white ants. If there should happen to be a decayed portion in a dark place near the ground white ants may gain a lodgment, and if undisturbed proceed on their destructive work through the sound portions of a log. But they much prefer softer woods, of which there is no lack in Burma, and usually leave teak severely alone. There are teak-built bungalows seventy years old in Moulmein in almost as good a state of preservation as when they were first built. One can always tell an old house by the width of the flooring. In the old days, when teak was cheap and small

staff was given away for firewood to whoever would pay the cart-hire, planks of ten and twelve inches wide were used for flooring. In modern times, with teak about four times its former price, floors are usually made of three and four inch battens, broad planks being either shipped to Europe or used in Calcutta or locally for furniture. With the rise in the price of teak all other woods have likewise advanced in cost, and house-building has become much more expensive.

As population has trebled or quadrupled, rents have gone up considerably. Houses that formerly rented for fifty or sixty rupees per month are now often let for one hundred and fifty and two hundred rupees. The poorer classes and officials on fixed incomes find it difficult to pay the heavier rents, and in the case of the latter the Government has found it necessary in many instances to give 'house allowances' to its servants, whilst in some places houses have been built for them, the charge for rent being a percentage on cost which would certainly not satisfy the aspirations of a Rangoon landlord.

Rice is now the principal article of export from Burma. It is grown in every district, but the delta of the Irawadi supplies the largest quantity and the finest kinds. It has advanced in price to even a greater extent than timber since the British occupation. In Burmese times, when there was no demand for export, more was grown than was necessary for consumption or than there was any market for. This is even still the case in some parts of the southern Shan States, which are without a railway or a navigable river, and rice is an article which does not pay to cart for any great distance. Old Burmans tell of the time when rice sold at ten bushels for a rupee. The same quantity would now cost from thirty to forty rupees. Burma has been so fortunate as never to have known such calamities of famine as visited India so often in the past century. Considerable scarcity has occasionally been experienced in parts of the dry zone of Upper Burma owing to failure of rain; but the people usually find work in other districts more fortunately situated, whilst trains or steamers can now carry grain from Rangoon to the affected parts. The Burmese also, unlike the Indians, never despair, and with their families are quite ready to go away from their homesteads till happier times come round. Their possessions are not numerous or bulky, and if they are near the banks of the Irawadi they can always make a raft of bamboos which will carry them and their few mats and cooking utensils a few hundred miles to the delta without any passenger fares being paid. They either tie up their raft at night or float on placidly along the stream, sleeping as comfortably under a few pieces of thatch erected on the raft as they would in their own village. They are

among a kindred people, and are sure of a meal of rice and fish at any house they pass, whilst a chew of betel-nut and a smoke would also be willingly bestowed on any one expressing a desire for it. They may also hear of a demand for labour for the next harvest, and may elect to settle, at any rate for a time, at whatever spot they think convenient, and where work and food offers.

The rise in the price of rice, though often grumbled at, is a benefit to a race which principally lives by cultivating it. Before the Indian famine at Behar some thirty-five years ago, the price of paddy or unhusked rice usually opened in Rangoon at fifty rupees per hundred bushels, rising to eighty or ninety rupees during the export season. The Government of Sir Ashley Eden bought rice largely for shipment to Calcutta, and prices of paddy rapidly rose to one hundred and thirty-five rupees per hundred bushels. From that year the highest prices obtaining in Rangoon have always been of three figures, which were never reached before the Behar famine. The rice-trade brings thousands of Indian coolies to the Burma ports. High prices enable them to be engaged at high wages, of which they spend as little as they can in Burma, usually returning to their own country in three or four years with savings amounting to three or four hundred rupees. A few settle in Burma, cultivating rice and becoming village money-lenders, at which occupation some amass fortunes amongst the less thrifty Burmans.

Along with rice—the first necessary of life to millions—prices of meat, vegetables, fish, poultry, fruit, have all advanced. *Nappi*, or paste made of fish or prawns, used by all Burmans, has also doubled or trebled in price in the last thirty years. No Burmese meal is thought complete if *nappi* does not appear at it. A few Europeans appreciate it, but they usually call it by the Malay name of *balachong*. The first Chief Commissioner, Sir Arthur Phayre, used to eat *nappi* regularly with his curries, and his example has been followed by several other Europeans, both official and non-official. The making of this fish-paste at some of the fishing-stations is said not to be an agreeable sight. But it is as well not to be too curious in looking into our own kitchens or baking-houses; whilst if we inspected slaughter-houses we should perhaps be inclined to turn vegetarians. *Nappi* forms to those Europeans who appreciate it an agreeable condiment to their curries, whilst to Burmans it is almost as great a necessary as salt to their otherwise monotonous meals of rice.

Sugar is one of those articles which, thanks to Free Trade and the large production from beet, has decreased in price. It is greatly in demand by Burmese for their confectionery and at their numerous feasts and festivals. With cheap sugar, British jams and preserves are now obtainable at about half the cost which prevailed a

generation ago. Strange to say, although they have cheap sugar no large manufactories of Indian jams or jellies exist, and those that are sold are only to be had in bottles and as a rule at two or three times the cost of the best British jams. One would think that this was an industry worth cultivating. If they could sell Indian jams at sixpence a pound profitably—and with sugar at twopence this should not be difficult—they might do a large trade. But they seem to prefer charging one rupee four annas, or about one shilling and eightpence, for a pound bottle of guava jelly, to creating a large demand for it at cheap rates.

Similarly, there is a large demand in Burma for preserved milk and cheese. The imports are from Europe; although excellent milk is to be had in India, and locally made cheeses can be obtained in Calcutta. Most of the cheese comes from Holland, and has not materially differed in price during the past twenty or thirty years.

Cloth, silks, and cotton piece-goods are lower in price than they used to be; but they have mostly deteriorated in quality, so whether they are really cheaper is problematical. As regards silks, they supply a demand for a low-priced article which will last for a fortnight perhaps, and will spoil at the first washing. We used to get high-priced silks woven locally which would last a lifetime. These are seldom seen now. The low-priced article has driven them from the field.

Nearly all the matches we get in Burma come from Japan, though some come from Sweden. British or other European matches are seldom or never seen. The Japanese matches are wonderfully cheap and good. When they were first introduced hardly one match in ten would light. Now a bad match is seldom seen, and this in a country where the rainfall is from sixty to two hundred inches in a year. I have noticed that British-made matches sent here have too bulky a stem, which, in a country where the air is always full of moisture, fails to ignite. The Japanese have recognised this, and make the stems thinner and more inflammable. When I first came to Burma residents who smoked usually carried a flint and steel in their pockets, and lit their cheroots or pipes with ignited tinder. Now, with matches so good and cheap, match-boxes are carried instead of flint and steel. In former times many residents kept a piece of lighted rope in their verandas from which fire could always be obtained. You never see this now. Matches are sold everywhere, ten boxes costing only one anna (a penny). When it is remembered that these matches come all the way from Japan, paying freight and insurance and 5 per cent. import-duty, the cost of production must be small indeed. Bengalis who have been to Japan have tried to set up rival match-factories, but hitherto not with any great measure of success. Matches

are so cheap throughout Burma that little or no care is taken of them. Children are allowed to play with them, and to this carelessness may perhaps be attributed several of the numerous fires which in some districts every dry season often destroy hundreds of houses and much valuable property. It is strange that the Finance Minister, who has lately put a heavier import-duty on tobacco, has not had his attention called to the desirability of making matches a greater source of revenue.

The tax recently put on cigarettes is not unpopular in Burma. Their cheapness caused them to be bought by school children on their way to and from their lessons; and the Burmese say they are responsible for many deaths from consumption amongst older people who have used them to excess. An excise on locally grown tobacco, which has been talked about, would be highly unpopular, and would go a great way towards killing an industry which, when once proper means of curing the article are adopted, should make Burma-grown tobacco as remunerative as the Dutch have made it in Sumatra.

Animals, like most other things, have greatly increased in price of late years. Fifty years ago even the best-trained timber-dragging elephants could be bought for one thousand to twelve hundred rupees, whilst a female elephant seldom cost more than seven or eight hundred rupees. Now three thousand five hundred to four thousand rupees is often paid for a trained animal. This advance may have something to do with the high cost of teak. There is hardly as yet a scarcity of this wood in the forests; but it has to be dragged for much greater distances to streams where it will float, the more accessible trees having been felled years ago. The labour required to get a log to a seaport is thus three or four times what it used to be. It has often been said that elephants only breed in a wild state; but this is an error. Calves have been born in Burma amongst the elephants kept by the Commissariat Department. In Siam I have seen as many as half-a-dozen amongst a herd of tame elephants owned by a Siamese trader who used to lend them out to travellers for carrying purposes, and who also contracted to drag logs from the place where they were felled to a navigable stream. Ploughing cattle are always in demand in Burma, where every third or fourth year cattle disease carries off large numbers; but they have not advanced in price in the same proportion as elephants, and in ordinary seasons can usually be purchased at from eighty to one hundred rupees each. Burma ponies—or Pegu ponies, as they used to be called in India, though Pegu does not breed or produce any—have risen enormously in price. In 1862 from sixty to eighty rupees was the usual price, well-matched pairs selling for two hundred to two hundred and fifty rupees. At the present time seven hundred

to eight hundred rupees is often given for a pair, and the ordinary price for a good pony is anything between two hundred and fifty and five hundred rupees. There used to be a considerable trade in Burma ponies between Burma and the Madras ports in native-owned vessels. These latter seem to have disappeared, and now the B.I.S.N. Company run weekly steamers to Madras, and also a weekly steamer to other places on the Madras coast. The ponies are mostly bred in the Shan States, where also prices are very much higher than they used to be. Government has not done much to encourage their production, but occasionally prizes are given for the best animals exhibited at local shows, and the frequent race-meetings held in Rangoon no doubt stimulate pony-breeding to some extent, for the prizes are valuable, and large sums may be risked in betting and race lotteries, in which the Burmese are always ready to join.

Whether the people are happier now than they were when living was cheaper and their wants fewer is a moot point which philosophers may argue over and differ in their opinions. No other part of British India contains a population so eager to trade and to adopt new things as the Burmese. At the same time, they keep up

their old ideas of hospitality and courtesy to strangers, their reverence for Buddhism and all the precepts it enjoins, their gaiety and light-heartedness under difficulties, and their joyousness in living, which makes life among them pleasanter than in any part of India. Those who go for a time to India are always glad to return here, where, instead of seeing in the street either half-naked coolies or solemn and soberly attired traders, only intent on money-making, one meets laughing women with flowers in their hair carrying their small stock of fruit or flowers to the markets, or joking men assisting them by carrying the latest baby or the lightest article they can find in their wife's or sister's stock. There will be at least some bright-coloured silk handkerchief or other article amongst even the poorest of this cheerful crowd; and with cheerfulness and happiness around him, even the European exile forgets for a time his own troubles, and thanks fate that his lot is cast here rather than in India, where such a sight is unknown, and respectable women are seldom seen in public except with face concealed, and where a female laughing outside of her own house would be thought an enormity for which nothing could atone.

THE JUDGMENT DEALER.

By DONOVAN BAYLEY.

HASTIN RUFFER, Bachelor of Science, felt that he would soon be in need of bread, for all his learning had brought him in no money, though he had tried for a disconcerting five months to get some one to hire his brains. His expensive education, the years of toil he had given to learn all about electrons, ions, mesoblasts, the Periodic Law, and the intimate facts about echinoderms, could not procure him a square meal. It was on this account that he determined to make his living by influencing the lives of other people—people who regarded five-pound notes as very ordinary things. He decided to apply to the psychological side of his fellow-men those processes of analysis that he had been taught to use in the cases of complicated but disingenuous chemicals.

Therefore there appeared in several of the London daily papers this curious advertisement, the cost of which left him with sixteen pounds, a stout heart, and a very grave manner:

'FORT OUT YOUR CONSCIENCE. I WILL HELP YOU.

'Why bear that secret self-condemnation any longer! It acts as a drag on you; it impedes your efforts to get on; it spoils your happiness.

'THE SCALES CAN BE BALANCED.

'Consult a dispassionate scientist, who will

bring a trained and icy mind to bear upon your problems, and deal with them from the standpoint of pure reason. Write to him at 387 Batchacre Street, W.C., using any name and address you like, from a newspaper shop to the *poste restante*, and

ENCLOSE A FIVE-POUND NOTE.

'I am a Bachelor of Science of London, and I will tell you what to do. I will deal out fair judgment to you; I will show you how to balance the book of your life on scientific lines. Remember,

YOUR CONSCIENCE MAY BE TOO TENDER.

'HASTIN RUFFER, B.Sc.'

'There are many people,' he had told himself, **'who would give a great deal, people to whom five pounds is a trifle, to consult some one whom they do not know, and, most important of all considerations, who does not know them, in order to have a dispassionate view of themselves and their actions.'**

But now that the advertisement was in type and paid for, he was not so sure.

And then came a newspaper man to interview him about his scheme.

Ruffer knew what to do, he imagined. **'Sit down and have a drink,'** said he, putting out the glad right hand of fellowship.

'Not before lunch, thanks,' the scribe made reply. 'What's this new game you've invented?'

'It's the outcome of Modern'——

'Cut that part right out, please, and tell me what it is itself, not what its progenitors were.'

'Certainly,' said Ruffer when he had got his breath. 'I used to know an old fellow once who worried himself to a shadow because he'd saved a man's life. You see, the man killed his wife shortly afterwards, and the old fellow blamed himself all his days because he didn't let him drown instead of be hanged. He said there would have been one more person alive in the world if he hadn't saved the man. He said that if he'd only pushed him under, instead of pulling him out, he would have done a far, far better thing. You see, he didn't know how to square accounts, how to sort out his conscience, as I call it. Now, I'm a trained scientist, and I can lend a dispassionate and analytical mind to such people.'

'I won't say your knowledge of human beings is far out,' the reporter admitted judicially.

'I know it's not.'

Next day's issue of the *Morning Record* printed a column interview, headed:

'MAN WHO ANALYSES HUMAN HEARTS.
B.S.C. WHO WEIGHS UP WICKEDNESS AND PROVIDES
ANTIDOTE.
PEACE OF MIND FOR FIVE POUNDS.'

By the end of the week Hastin Ruffer had more 'cases' than he could deal with conveniently, and he was compelled to engage a secretary to answer the simpler problems.

To his unbounded astonishment, quite a number of people paid personal calls, though few of them indeed gave their names. Some of those who called went away at once, saying with acerbity that he was too young; but those who noticed his clever, ascetic face stayed, and got much practical, common-sense advice from him for their five-pound notes. One man—such is human nature—tried to bilk him.

He imposed pretty stiff sentences at times, too. Some of his judgments were quaint.

One prosperous old man came to consult him about a vile temper. 'I can't understand myself,' he said. 'I have a dear, good wife and a most charming daughter. I am very fond of them, but hardly a day passes that I do not break out into some passion or other that makes them both—and me—wretched. They have only one life each to lead, and I have poisoned—yes, poisoned!—their lives up to now. Only this morning I threw a piece of hot buttered toast at my daughter, and she had to go away and wash her hair. It's not the sort of thing that can be made up to them. I feel I ought to be punished for it.'

'Why don't you control your temper?'

'I do, as much as I can.'

'You do? I see. Are you fond of walking?'
'No; I hate it, loathe it, abhor it.' He did not tell Ruffer that he began life as an errand-boy in the days when there were few omnibuses, and that he had marked his emancipation from that humble state in life by riding everywhere.

'Well, I think you must walk five miles every day, and ten every Saturday.'

'That's pretty stiff, isn't it? Won't less do?'

'It's what the case demands,' Ruffer answered sternly.

'You don't let people down lightly.'

'You've paid me, and I've given my reasoned opinion. Good-day to you, sir.'

'Wouldn't it do if I paid large sums to charity anonymously?'

'Five miles a day, and ten every Saturday. There are two other people waiting to see me.'

'A five-pound fine, and a sentence of hard labour too! It's a bit stiff,' the hasty-tempered man told himself, and he began to get into a boiling rage, until he remembered. But he went away and did what he had been ordered to do, for he had a conscience that would not let him off. Also, in six months he had a normal liver, the temper and patience of a saint, and a keen relish for long tramps and bread and cheese and beer lunches in wayside inns.

One day, sitting smoking his pipe on a stile, he broke into hearty guffaws, and slapped his knees like the merriest old merchant that ever came out of the City of London. 'I see now,' he bellowed. 'I went to him about my temper, and he cured my liver. Now, if I'd gone to a doctor I'd have had some physic, and ha' been as bad as ever. That chap ought to be paid by the State'—which was a very socialistic thing for a true-blue old Tory to say.

Many a queer story was told to Hastin Ruffer, and often enough he answered, so to speak, with his back to the wall; for some of the things to which he had to listen almost defied cold justice, and made the Judgment Dealer want to kick out with both feet.

Yet he soon forgot the majority of his 'patients,' and he never made notes. But one 'patient,' a girl, lived in his memory for many weeks. She called to see him in the twilight of a winter day, and her face—a pretty face it was—was as white as her ermine cloak. She was one of those slender women who seem to be caressed by their furs.

Ruffer looked at her earnestly, and found it hard to believe that she had anything on her conscience. He could as soon have suspected a kitten of forgery.

'Do you know who I am?' she asked very anxiously.

'No.'

'I'm so glad! I feared you might. May I ask for your advice?'

She laid a five-pound note on the table, and Ruffer took it.

'Please sit down and tell me what you have to tell me in your own way,' he said kindly.

'I do not think I have done anything wrong,' she went on; 'but I do not know if what I am thinking of doing is wrong. I want you to advise me as dispassionately as you are able, and I do not want you to be common-sense, or anything horrid like that. I want you to deal with me in the most ethical way.'

'That is exactly what you have paid me for.'

'I am engaged to be married,' she began.

'Am I to congratulate you?'

'That's the whole point,' she said eagerly. 'I do not love the man I am going to marry so well as I love another man.'

'Then why not marry the other man?'

'I want to know which of the two it's right for me to marry. That's just why I've come to you. I like my fiancé very much. I'm not altogether sure I don't love him, in a way. I know I love the other man.' The prettiest, palest pink stole into her face.

'And the difficulty?'

'Money.'

Ruffer looked disappointed. Somehow it seemed a pitiable thing that so delectable a girl should hesitate on such an account. She saw the look.

'It's not so simple as that,' she said. 'Should children obey their parents?'

'When their parents are in the right.'

'Father is very, very fond of me,' she explained; 'and it's because he's so fond of me that he wishes me to marry the man to whom I'm engaged. That's why he doesn't want me to marry the other. Besides, I haven't been brought up to be a poor man's wife. So it wouldn't be fair to the poor man, would it?'

'How poor is he?'

'He has five hundred a year. Need I tell you that five hundred a year wouldn't begin to dress me?'

Ruffer sat silent.

'Well?' she said.

'What would you do if the poorer man were killed on the way home this evening? Suppose you knew that you would never see him, never speak to him again?'

'I don't know.'

'Pardon me, that's the one thing you do know.'

'But he won't be killed on the way home.'

'Ah, you shirk the answer; you daren't face it. What would you feel?'

'I don't think I should ever feel again. I should be numb.'

'Then what's your difficulty?'

'Why, he can't keep me.'

'I take it you're made of the same sort of stuff—carbon, oxygen, nitrogen, and so on—that other people are made of?'

'Of course.'

'Then why can't he keep you? An expenditure of ten shillings a week is ample to provide food for the normal human organism, and provide enough to keep it healthy, and therefore happy. Why can't he keep you?'

'This cloak I'm wearing cost more than he earns in a year. I could sell it second-hand for more than five hundred pounds at this moment.'

'Then sell it, and buy with the money the house you'll live in. It'll have a weather-tight roof and a sufficient cubic air capacity. What more do you want?'

'But'—

'Is he fond of you?'

'He tells me so,' she averred shyly.

'How do you think he will feel if he loses you?'

'But I shall lose him too.'

'No; you'll sell him, or, rather, yourself, for ermine cloaks, glittering bits of carbon called diamonds, and choice foods to tickle your palate and ruin your digestion. The animal called man thrives best on simple foods, lives longer, and is happier during life.'

'You put it very horridly.'

'But it's true.'

'What use would I be to him? I can't cook, I can't darn, I don't know how to keep house, and I'm sure I couldn't shop for him. I should bankrupt him in six months.'

'Ah, now you're telling me you're a fool, and you're not that.'

'I'm telling you nothing of the kind. Why do you scold me like this? I came for disinterested, calm advice.'

'And you're getting it. You can learn to cook, if you're a person of average intelligence, in six weeks. You can teach yourself to darn in an hour. You can shop through one of the big stores, for they send you what you order, and they charge you the fair market rate for the day. As to your expensive clothes, they are about as necessary to you as caviare. The point is this. We live in a country whose climatic conditions make it necessary to place round our bodies layers of materials which do not readily conduct heat. The reason is that the skin is continually radiating the warmth generated by our food. That is, we are continually losing heat. The function of our clothes is to retain that heat, and so keep us comfortable and healthy. Now, a knitted jacket, if it be made of wool, is just as useful as ermine, and much more hygienic, for it can be washed again and again. Also, it is within the means of a man with five hundred a year.'

'But it would be so'—

'Pardon me. Now, what I want to ask is this: are you willing to give up the only thing that is really satisfactory in life—love—in order to be able to keep warm by means of the skins of animals instead of by their wool? Must you have their hides, or will their hair satisfy you?'

Are you, in fact, civilised, or are you a savage?' 'I don't think I'm a savage; but is it savage to want pretty things?'

'Not if you can afford them. But can you afford them when the price is lifelong unhappiness? Wait a minute, please. Take the question of food. You eat to repair the waste caused by your energies, and by the manufacture of heat inside your body. There is no other defensible reason for eating. Now quite plain and quite cheap foods, like New Zealand lamb, cabbage, potatoes, apples, carrots, turnips, rice, and bread, are the very best you can have from the point of view of your physical well-being. Are you going to traffic in your emotions in order to be able to eat foods that are not so good for you, though they are much more expensive, and please your palate better, because your palate has grown used to them?'

'I've not heard the question put like that before.'

'Haven't you? You have paid me for a scientific answer to the question whether you should marry for love or money. I have given it to you.'

'But we should have to live in some wretched place like Peckham Rye.'

'On five hundred pounds a year? Indeed no. You might have a pleasant little house in the country, or you might live in one of the northern suburbs, such as Barnet. At a place like that you could have a tricar and two servants on that money. You and your husband could leave the house to the servants at the week-ends, and go off motoring through the loveliest country in the world. If he had only a hundred and fifty a year, I would still tell you to grow up, become civilised, marry him, and have a good time. You wouldn't have the servants or the tricar; but you'd be happy, healthy, and worth while in the world.'

'But all my friends would drop me.'

'Tell me, on your honour, would you care if they did, when you had your husband?'

'Not very much,' said she.

'Then there's no more to be said, is there?'

'But it would be such a change. One dreads'—

'The mountain-tops after the hothouse, I dare say. You may not be woman enough to live for your spirit instead of your body.'

'But suppose he stopped loving me?'

'That,' said Ruffer, 'has nothing to do with this question. He might stop loving you if he were an earl. Which are you going to choose, nose-rings, anklets, and the tails of fat sheep, or clothes that keep you fit and food that makes you healthy?'

'Nose-rings! the tails of fat sheep!'

'Exactly. The aristocrats in some parts of the world wouldn't give a farthing for ermine and diseased liver. What they sell themselves for

are copper nose-rings and the morbid tails of sheep. Fashions vary, but the idea's the same.'

'I came here,' said the girl, 'thinking you'd tell me the right thing for me to do was to obey my father, and marry the man he wants me to. I came to you because you don't know me, and I hoped you'd look at it as a stranger would. If your verdict had been that I ought to let love go I wouldn't have done it; but I should have had an uneasy conscience all my life. I expected tact from you, and you've taken a bludgeon and hammered away at me until you let fresh air into my soul. I can't thank you enough.'

'Then you never meant to marry the rich man?'

'No. He's fat, he's middle-aged, and he patronises me. I've known him since I was in the nursery, and I was afraid I ought to marry him.'

'It was a needless fear. Go away, and let your soul grow up.'

'I'll take it out of its fur lining,' she said. 'That's all it wants.'

'I think it is,' he said, shaking hands with her.

She sent him a piece of the wedding-cake.

'I made this cake myself,' she wrote, 'and I don't think it's at all bad. My husband—I'll send him to you if he misbehaves—has been made junior partner, so we shall live up the river in summer and in town in winter. The tricar is going to be a twelve horse-power car; but I'm half-sorry about that. I'm going to do the cooking, at any rate at first, for he says I cook beautifully, and my clothes won't be too useful. I wonder if you'll remember whom this is from. I shall never forget you. You were so very quaint, and so very right too. Wish us luck.'

THE HEROES OF THE SILENCE.

Nor in the gray old abbeys
Sleep all her sons of fame,
Nor on the marble columns
Is written every name;

But many of the workers,
Whose hands have wrought the best,
Have sunk into the silence
And in the shadows rest.

For them we raise no marbles,
For them we shed no tears;
But still their glory liveth
In the honour of the years.

When laurel crowns have faded
And triumph songs are past,
The heroes of the silence
By deeds they wrought shall last.

For sculptured marbles crumble,
Old abbeys have their day;
But the glory of the silence
Shall never pass away.

ARTHUR HUNT CRUTE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

WHEN the object of the world's attention changed from the warring Balkans, with rivers of blood running through south-eastern Europe, corpse-covered roads and fields, wreckage of armies everywhere, men's minds obsessed with thoughts of shooting and killing, foulest pestilence in the air, the plaintive cries of lost and hungry little children for the fathers and mothers they would never see again, everywhere destruction, misery, and the antithesis of human progress; when the world all in a morning moved its glance and its thought from such an oppressive scene to that of great, vast Canada, upon which the snows, with all their beneficent influences, were just then beginning to fall—Canada of the fiercest commercial and industrial energy; Canada the practical, the progressive, the hopeful and the happy, above all the peaceful, our magnificent Canada—the change was a delightful thing. It set alight again hope and belief in men and the world. To British people the change was most specially welcome. The Balkans were full of forebodings for us. Greater wars were threatened; gloomy comparisons were being made between our present and future naval capacity and that of certain other nations and combinations of nations. That sense of the loneliness of Britain that gets on our nerves from time to time was coming again. And thereupon Canada spoke, and told them all that she would pay for three of the best battleships that had ever been built for the use of her mother-land. I can find it in my mind to believe that even certain of the European Powers who were not exactly benefiting by this arrangement experienced a sense of pleasure, if a fleeting one, on hearing of it. It stood for reason, courage, truth, loyalty, determination, and progress; it stood for a better world.

* * *

It so happened that I who write was newly back from Canada when there was made this great announcement which may well have more to do with the future of the world than anything else that has been said or done in the lifetime of any of us, and it inevitably revived many recently formed impressions and created new reflections. I had spent a deeply interesting and instructive time in many parts of the

No. 113.—Vol. III.

[All Rights Reserved.]

United States, enjoying the rich hospitality and helpfulness of the Americans towards their kinsmen; and nowhere had the wonders of the country, and the enterprise, sociability, and other admirable qualities of the people, been better demonstrated to me than in Chicago, where I then was for the second time in a long journey. But the shaded thermometer had for some days past been aspiring to the hundred mark, and the conditions of life were not comfortable. For that reason specially it seemed good at the moment to go climbing up in that Grand Trunk train into Canada, where it could not be so torrid. But the man who knows not Canada and approaches her for the first time from the United States has many peculiar sensations. He is fuller of wonderment and curiosity and defeated imagination even than when he first sailed into New York, and in some cases he may be a trifle uneasy at leaving such a splendidly kind and warm-hearted people behind him. Now, Canada takes a great deal of understanding, and certain difficulties of perception, leading up eventually to a thoroughly clear and happy knowledge, began from that moment. The vastness of the country and its magnificent resources I appreciated from the map and the statistics that I had absorbed; the local colour and the details, the real impressions that would be supplied me in the far distance that I was travelling in the country, would make the other knowledge live; but there was something difficult to do in coming to understand the exact feeling and temperament and disposition of this Canadian people, and it seemed to most thinkers that in this attitude and disposition the future of the British Empire and the world was bound up. It is impossible for people at home who have never been in Canada to understand exactly. We cannot gather much with confidence from the Canadians who come home to us except that the country is very wonderful, that their prospects are good, their life healthy, and that Canada is very loyal to the mother-country—very loyal—always that. We take this for granted perhaps too readily. Then we are told from time to time two exactly opposite things about Canada, one being that it is more British than Britain, and another that in some respects it is more American than the United States. You remember hearing both these observations made. Sometimes they

JANUARY 25, 1913.

are not applied to the whole of Canada, but to the very representative city of Toronto alone. I was going to Toronto, and I should begin to try to find out which was right from about twenty-five minutes past eight on the following morning.

* * *

In the meantime I embarked on a preliminary voyage of discovery in the way of snaps of conversation with travellers on the train, who were mostly Americans. It was noticeable with what wholesome respect they talked of Canada. They seemed to admire her enormously—her sturdiness, courage, independence, and her glorious resources. 'She will be greater than we are!' was an admission freely made by several people of sense and understanding; and it was a remark made to me by Americans at other times and places. It is a rather considerable admission of prophecy for a citizen of the great United States to make. They said that at present, even with her accelerated rate of progress, she might in some things be said to be fifty years behind America; but she would catch up in probably another hundred, and then our great-grandsons would see what they would see. So much were Americans impressed with the future of the northern country that out in the west they were flocking over the border into it by their thousands. It was creating uneasiness in some American places. People emigrating from the United States into Canada indeed! But was this not leading to a greater fusion of interests, and to the gentle Americanisation of Canada? Now they were getting to the point. 'What will happen?' was an obvious question, hesitatingly put. 'Oh, Canada will come along with us in the end!' was the invariable answer, given in a tone of the utmost confidence and decision. It seemed to be the real belief of the average American that the more or less complete fusion of the two countries in the not very distant future was inevitable. The fact that this impression is abroad is of some importance. 'What,' said one gentleman, 'has Canada to gain by remaining in close association with the mother-country? What has she not to lose by holding aloof from America? She will at any rate announce her complete independence as soon as she can. That would practically amount to a joining up with the United States. At present she is not strong enough for such independence. She has not the people or the money. When she has them she will establish that independence which is the instinctive desire of a people as it is of an individual.' To the best of my ability I answered the gentleman's questions and gave combat to his arguments; but Americans are very stubborn, and, to tell the truth, not very enlightened in regard to any other politics than their own. A ten years' course of the Concert of Europe would develop their minds in this respect most excellently.

At six in the morning I awoke, shot up the blind alongside my berth, and looked out upon a rather cold-looking, raw Canada, thinly enveloped in an autumn morning mist, with a little chill in it that was welcome as the east wind which sometimes blows down the Strand would have been to us when we were sweltering in New York and Chicago. There was no doubt about our being in a daughter-land of Britain. The train steamed past big works and manufactories continually, and the names of their firms were painted with 'Limited' at the end instead of the American 'Inc.' (Incorporated). Rather late, the train dawdled into the Union Station at Toronto, and then one's mind began to work upon problems of differences and realities. A certain Britishness of things at once became apparent. The very Union Station itself was that way. It was more like the British station than the American one in a big and important city, in that it was somewhat rough, not elaborated, a trifle untidy, and not so convenient as are the stations at great American places. No great concourse, no great number of parallel tracks, no separate track for every route, no fine waiting-rooms. After dealing with the Customs officials, people felt hungry, no breakfast having been provided on the train. It was nine o'clock, and it would be at least an hour before we could be fixed up in hotels; hence an obvious move towards the refreshment-room on the other side of the line for coffee and rolls. Hard things have been said of the refreshment-rooms on British railways; but when the pangs of hunger and thirst drive me to one on some future luckless day, I shall think of myself sitting on the high stool at the rough bar of this particular refreshment-room, seeing all the foods in tins and boxes and paper bags, and the general arrangements crude indeed, with a man behind dealing out the goods in a rough-and-ready way; and then I shall rest serenely in happy satisfaction as feeding on nectar and ambrosia from vessels of silver and gold. Mind, I do not say this is characteristic of Canadian refreshment-rooms, and even here the food was good enough; but everything was so severe and simple, and almost primitive. A man in a rough tweed suit, with a cold, hard look on his strong face, hopped up on to the stool on my right, and reached across my cup with his left arm for the sugar-basin. Two young women came to the counter on my left, gave orders in a sharp, quick way suggesting their knowledge of going about, and then talked about their arrangements rapidly to one another, caring nothing about being overheard. Here in ten minutes I gained a first impression of the Canadian spirit which was confirmed in every experience afterwards. On the faces of nearly all the people there was the look of the wanderer from home, the cold, stern look of the adventurer for fortune, the calm sadness of one who had left something behind, and was with some

strength and courage fighting forward into the unknown. They were going out into an untouched world where a first beginning was being made with everything. Their strength and determination were paramount. Conventions and petty social customs were being fast abandoned. Each man was for himself.

* * *

This suggestion was more conspicuous in Toronto than in any other Canadian city that I visited, and for what seemed to me to be a clearly defined reason. Toronto is a place of going through, one of the spots from which the adventurers take their plunge. You also get the impression of 'going through' when at Montreal, but there is a strong mixture of interests and attitudes and intentions in this beautiful city. Not so French, of course, as Quebec, it is yet very French; and it seems a little apart and a little completer in itself than the other cities in the Dominion. More people go there to stay or to go back to their own country. Many who go there, also, are going straight into the States, along through Vermont to Boston or New York. The far west of Canada somehow seems less to Montreal than it does to Toronto. In Canada, as in the United States, the halls of the great hotels are as the hubs of the cities, the centres of movement and disposition. They are the human exchanges where people meet, talk, settle affairs, think, and make their arrangements for travel. In Montreal and in Toronto there are the halls of hotels which exactly correspond to each other, that of the 'Windsor' at Montreal and that of the 'King Edward' at Toronto. Every hour of the day and night these halls are alive with people coming and going and making arrangements. In each case there is the great desk for the clerical staff on one side, the railway ticket-offices on another, the bookstall on a third, and the remaining space is filled up with candy and tobacco departments, and such like. Opening out are the cable-offices. There are seats in the middle and everywhere; and all the time there is the quick clattering of feet on the tiled floor, and the clanging together of the gates of the big lifts. But the difference was this, that at the 'Windsor' there were many more ladies in evidence, there was much nicer dress, black clothes and white linen were common, even silk hats were seen, and you might notice men with white and well-tended hands. More than these, there was bright, spirited conversation, some jokes, and much laughter. People were enjoying prosperity, and there were bright countenances enough. Also, it was noticeable that the hotel detective was keeping a very sharp lookout on everything. The King Edward Hotel at Toronto exactly corresponds with the 'Windsor' at Montreal, though much newer. It is a most admirable institution, as well managed as any hotel in the United States, and has become a conspicuous and important centre of

Canadian life. Here also, in the hall, you have the clattering and clanging, and the great, quick bustle; but there were few ladies, less fine black clothes, no white ties, few smiles, but everywhere a most impressive sternness. You could see the look of something left behind in the faces of the men—a sad look, but one of great determination. Here in this hall the sense, the impression, of going through, of being about to enter the gates of the new land, was overpowering. Calgary! Edmonton! these places at the eastern foot of the Rockies, and the fast advancing Prince Rupert beyond them, had suddenly begun to seem the great places of the world. You were hearing of them all the time, seeing the names printed, becoming obsessed by them—Calgary! Calgary! Edmonton! Edmonton! Everybody was 'going through.' Cold, stern-looking men trooped into the hall early in the evening. They had come on from Montreal. They lounged about the great hall, wrote some letters feverishly, sent some cables, sat down with their cheap cigars between their lips, and gazed long and meditatively on the tiled floor. This attitude of brooding was a common one. And then some time later, about eleven o'clock at night, when more were still coming in and getting ready to go through, the loud voice of a hotel servant was heard shouting out the announcement that the train for the west was leaving at a certain time that had nearly come. Then men got up from the cane seats, shook themselves, set their features again, and started to go through. This was the real beginning of their new life. There was Winnipeg in front of them to stay at before they finally dropped away into the west; but Winnipeg was far away, and itself of the west.

* * *

Certainly everybody does not arrive at Toronto to go through it. It is a great and complete city itself, and the most enterprising, thorough, and up-to-date place in Canada. It is quite different from any other. Its atmosphere is inevitably tinged with the spirit of the Canadian West. The people of Toronto lead cold, serious lives. They are simple and intensely practical. They know themselves to be great pioneers, and their ways are those of pioneers. They are now, in their increasing prosperity, introducing some fine and beautiful things into their town-life. Besides good concerts and a great exhibition, there are many other evidences of a certain completion that is being given to the life in the Ontarian capital. But, for all that, simplicity and severity are predominant. Life is sterner here than in most of the older American cities where so much more money has been made. In the American city family fortunes were established a generation or two back, and there are signs of wealth, some luxury, and many means of enjoyment at every hand. It is not like that in Toronto or anywhere else in Canada. Work and advancement

are almost the only things that are thought of. Pleasure has but a small part in the scheme of things. Manners are brusque. Notices are severely plain. 'Keep out!' is what you see in big printed letters on the doors where building operations are going on inside, instead of the gentler intimation that there is 'No admission except on business.' Instead of the notice that pedestrians along a temporary footway or underneath some scaffolding should not unnecessarily loiter, the injunction 'Be quick!' is made. The point is reached quickly and with force. The city is made up of square blocks and straight lines on the most approved American plan, except that it will not have numbers for its streets. It calls them by such names as 'King' and 'Yonge,' frequently omitting the word 'Street' from the signs on the corners of the buildings. Its restaurants are for the most part of a simple kind; of taverns there are scarcely any, and there is a strong movement towards their almost complete extinction. While I was there I read a long editorial in one of the leading newspapers against the evils of alcohol and the misery and ruin it causes, and a passionate appeal for the stamping out of this curse in Canada, a cry that nobody should be content until every tavern is closed and alcohol is shut out of the land. This vehemence occurs constantly, and is generally based on a text of some act of crime committed by a drunkard. It is a wonderful, magnificent ideal that this new, clean, natural land shall be made a country without the alcoholic poison, where men can make their efforts and lead their lives unhandicapped and untrammelled by beer, wine, or spirits. Some say that it is an impossible ideal. With

that question I have nothing to do. The point is that the ideal exists and is making some progress. At seven o'clock on Saturday night every bar is closed and the lights put out, and from then not a drop of alcoholic refreshment can be bought for money until Monday morning. The visitor staying in an hotel cannot have it served to him in the smoke-room or anywhere else about the hotel except with his meals or in his own bedroom. However far the Canadians may fall short of their ideal, the Saturday night carouse is at all events an impossibility now. When most of the shopping has been done the streets relapse into a very quiet way. There is no shouting and laughter, and no hilarious prancing of the pavements arm-in-arm, with noisy song-singing, because there is not to be had that which inspires these exhibitions of peculiar emotion. Toronto is altogether tremendously severe and idealistic in the matter of morals and conduct. It is all for the simplest and the purest life, for quickness and hard efficiency with it. It seems as if subconsciously there is throughout all human Canada the ambition of catching up and passing, of making very good in a most tremendous enterprise. And be sure it is being done. Nothing is being left undone that might increase its efficiency and that of its people. Its educational systems are magnificent, and the city is expanding in the most wonderful way. Go to the outskirts in any direction, and you see not just a little building being done on the fringe, but acres and acres of it, in every direction, as if the whole city had only just been begun. I will continue these Canadian impressions another time.

THE SHIP OF SHADOWS.

CHAPTER XII.—THE HOMEWARD BOUND.

THE weather reflected our cheery mood. The deck was bone-dry. No more hanging on aloft with numbed hands in the roaring gale; no more flooded fo'c'sle; no more haunted nights. The ocean's truce was as thorough as her onslaught. But for the sense of distance in the specks of sail on the immensity of the sea, I could have imagined we were on some Highland loch, spanking along under a summer sun and a summer breeze.

'With Callender left behind we were only a "threesome" now before the mast—Lowden, Evan, and myself. Lowden read, or pretended to read, when off duty; but his eyes often travelled aft. He was silent, as usual; but, after all, a silent shipmate is better than a quarrelsome one or a windbag, and the three of us rubbed along uneventfully.

'The skipper had bought a collie dog at St John's. "Dugald" was a privileged passenger,

free of the sacred fo'c'sle, where even an officer rarely shows his nose. He had the freedom of the ship and the run of his teeth in the galley.'

'A sable! I got him when she stranded,' I interjected.

'Strange, isn't it? If "Dugald" could have spoken he would have been as interesting as Crusoe's parrot, I think. A good, kind beast!

'Evan and I often loafed under the lee of the scuttle hatch o' nights, out of the stuffy little fo'c'sle. Tobacco rose on the evening air. We would sit "swapping lies," as the phrase goes, Evan recounting marvellous tales of the occult or his adventures on far seas; or out would come the concertina, and his rich baritone trolled out sailor-men's songs gathered from the ends of the earth; songs, too, in the soft Gaelic, one a haunting memory of his beloved Skye, Nicholson's "My heart is yearning for thee, oh Skye! dearest of islands," in its cadences the melody and

mystery of the seas around the misty isle. "Ah, I'm thinkin' no one but a Skye-man will pe understandin' it," Evan would remark compassionately to us Sassenachs.

'The Old Man gave all his leisure to his girl-wife. Theirs had been a chequered honeymoon, and now, in the sunny weather, they laid the ghost of the days on *The Berwick Law*. Happy laughter rang over the ship, for the skipper was a big boy at heart. It did one good to see the two of them romping with the collie like children. . . . I don't like to recall those days.

'One day the deck seemed strangely dull, for she did not appear. In the second dog-watch the mate came forward. "'Ot an' shiverin' Mrs Gerrand is," was all he could tell us. "Tykin' proper care, she'll be all right in a day or two." But a day or two passed, and still she did not appear. The Old Man was very restless, going up and down the companion-way twenty times an hour, and every hour the lines on his drawn face deepened. Gradually a silence fell on the ship.

'Lowden, to all appearances, did without sleep. He haunted the deck, hollow-eyed, as haggard as the captain. We went about our routine work almost on tiptoe. No jesting o' nights forward, our voices lowered, orders in subdued speech instead of the familiar shout, the swish of the sea and the ship's bell strangely loud in the stillness. A Shadow was chasing us.

'One evening the captain came on deck, his face gray under the tan. He scanned the sea with his binocular, and altered the course a point or two, for a big barque was coming up on the port side. We ran up the signal in the curt Commercial Code, "Send—doctor," and then waited like men in the dock. It seemed hours before the reply fluttered out, "*We—have—none.*" The Old Man sat down limply by the rail, his face in his hands for a minute or two, and then went below to watch his wife die.

'The smoke of a liner in the distance raised our hopes of a doctor. She came quickly up, the passengers lounging at the side watching us, so near that I caught a bar or two from her band, the strains of a Strauss walse, life, joy, youth in the swing of it.

'Just then the captain came on deck with the slow, dragging step of an old man, his face lined and drawn. "She's awa'!" he said twice, and that was all, except a gulped, "No' th' day, biddie," to the collie, that had trotted up to him, ears and tail a-quiver, confident of a frolic.

'Our signals were lowered. The music on the liner suddenly ceased as we ran the ensign to half-mast, and the big ship passed on, her engines' throbs beating fainter and fainter, leaving our little craft alone in the silence of the darkening evening. Lowden paced the deck all night.

'The morrow, a still, sunlit day, saw the jib-sheet to windward and the schooner's way deadened, the four of us in the afternoon

watch, bareheaded, standing beside the Union-jack covering the slight figure, the Old Man, The Book in hand, at the head; over all the great blue arch of the sky. He cleared his throat and began to read a service of the Kirk, groping for the words. Half a sentence perhaps: "*Behold, I shew you a mystery;*" then a long pause. It was asking too much of Duty, too much of any man, we thought, and the mate stepped forward, saying, "I'll take the Book—if you like, sir." Kindly meant; but the Old Man turned almost fiercely, and waved him aside, mute. His voice gathered strength at the interruption as he stumbled on—"O Death . . . thy victory! . . . Therefore . . . be ye stedfast, unmoveable"—to the end. Then he turned, as he would have phrased it, to "the day's darg" with "Let down the jib-sheet." The schooner gathered way again. The Old Man watched the pitiless radiance of the sea until nightfall, when an unseen Hand slowly drew a cloudless curtain over the heavens and sprinkled it with a million jewels, one star differing from another in glory. . . . A night for lovers' dreams, the unmarked grave far astern.'

CHAPTER XIII.—A CHANGE OF MASTERS.

'I HAD been standing opposite Lowden during the service. His jaws were twitching. He never lifted his gaze from the flag, except once, when he looked at Gerrand with smouldering, hollow eyes. The Old Man never looked his way, and no one saw Lowden's glance except myself.

'Two days afterwards a strong wind came out of the westward, and its call to action was a relief after the gloom on the ship. The Old Man fought with his grief, biting on the bullet with the instinct of the strong; alert and vigilant again, his eyes alive for a weather change.

'It was early in the first watch. Lowden was at the tiller, Hulse just about to relieve him.

'Lowden, coming forward from the tiller, stepped quickly to just within a yard of where the Old Man was standing, and I think, though I can't be sure, that he said something, for the other man spun round instantly, his brows black as thunder. The two men stood for a moment, eye to eye.

"I beg your pardon, Captain Gerrand," said Lowden, in a low voice, cool and easy. It was not meant to reach any of us, but the words carried. Then, as if to an equal, and there was no mistaking the thinly veiled insolence, "I thought perhaps that—I frightened you."

"You made a mistake then, my man," rapped out the Old Man, his voice pitched for us to hear. But he added something in a lower tone that I could not catch, and then with a straight eye at the other man, "Go for'ard and get something

to do." He turned on his heel, and Lowden sauntered forward with an ugly smile. Then, for the first time, I saw a glint of hate, fierce and definite, in his brooding eye.

He had only gone a few yards when the Old Man called to him to come below. He hesitated for a moment, then hastened to the fo'c'sle, came back in an instant, and then, his lips in a thin, hard line, went aft and followed his captain's lead down to the cabin. There was no one below except these two. We could hear them talking, the skipper's deep growl, then the other man, a change in the inflection of his voice. This went on for perhaps a couple of minutes. Hulse, at the tiller, looked puzzled; and Evan and I waited, wondering, until Evan pointed to the companion-way and whispered, "Listen."

"I looked at the mate, but he pretended not to see; so I tiptoed half-way down the companion-way, and there I crouched and listened.

"The Old Man was speaking in his deliberate bass. "Yes," he said, "my Madge, the wife I lost th' day, told me yer name—or one o' them," he added. "Ay! with her last breath almost she told me."

"The other man said not a word.

"I don't forget that ye saved *The Berwick Lass*, and, like enough, our lives; but, man, 'twas a sorry game to follow a good woman—ay, and one that I won fairly," the captain went on—"to her husband's ship. Though I never set eyes on ye till ye signed on in Trinidad, I've a good memory. I know ye, and I know a deal more about ye than ye told my poor lass."

"Is this all you wished to say to me?" asked Lowden calmly. He might have been a judge listening to some appeal.

"I'll say more if ye sail my temper a bit nearer the wind. Let it go at this, that I know ye, and if by a word or a blink—as ye did just now—ye try to best me, or if ye come within arm's-length o' me without orders, I'll clap ye in irons for the rest o' the v'y'ge!"

"Better not try. Better that we had all gone down in *The Berwick Lass*! I've commanded a few crews, and I never put a man in irons yet. I had—other—swifter methods. 'Tis a slow process, the law."

"I wonder that the Old Man did not catch the danger-note in the smooth speech. But Gerrand's temper had gone by the board. He fairly roared at the other man.

"Ye may have commanded a fleet, but—one ship, one master! Ye're on my ship now, and s'long's ye are ye'll obey my orders at the run. As for the law, ye're the last to forget that I've a police flag handy, and ye'll maybe find that it'll land ye straight fra the Tail o' the Bank to Duke Street Jyle." He leaned over the table. "There's short shrift, if I say the word, for a man that's worn the Queen's uniform and changed his name. Ye damned blackbirder—and worse—Cap'n John Gregory, Eric Lowden, able seaman, whatever

name ye sail under!" The words tumbled over each other in his anger.

"I could not see what happened, but I heard an ugly oath, the sound of something lifted and thrown, the smash of a lamp, then the Old Man's voice, "Pick yerself up, ye dog, and get for'ard."

"I tiptoed swiftly up on deck.

"Lowden came up the companion-way, blood running from a cut on his forehead. He must have been an ugly customer to tackle, but the Old Man had a giant's frame.

"Put this man in irons, Mr Hulse." This from the Old Man, his wrath down, clear and composed, the voice of authority. Hulse left the tiller and made to come forward a step or two.

"Fair warning, Hulse! I've no quarrel with you," came through Lowden's clenched teeth. The man's face was white and desperate, his eyes were filled with madness; a thin runnel of blood trickling down his face.

Evan and I exchanged a look, and made for aft, but we were too late. The Old Man's hand pointed steadily at Lowden. Poor Hulse stepped in front of him towards Lowden. There was a sudden movement, the crack of a revolver, and Hulse reeled back to the shrouds, clutching them with one hand.

"I'm sent for," was all he said. For a minute we stood paralysed. Then Lowden, with incredible swiftness, sprang back. The Old Man, livid with wrath, seized a belaying-pin, hurled it at him, and ran in. The revolver cracked again, the man behind it as cool as if at a game. Gerrand reeled and then stood swaying, one hand at his throat, his face suddenly ghastly. The schooner, with no one steering, sheered heavily. There was a sudden lurch. The wounded man staggered blindly, and his murderer fired a second shot just as Gerrand reached the port-rail. The captain gave a wild clutch at Hulse with his death-grip. Next moment the schooner gave a great roll to the main-rail, and in a dreadful second, before we could move, both men went over the side. I recall it all now: the pools of blood on the deck; the collie wagging his tail, peering over the side; one choked cry from the captain, and the last glimpse of the two men for a moment in the sun-flecked foam in our wake. They sank like stones, dead, I believe, almost as soon as they hit the water.

Evan and I made to run to the tiller, but we were brought up standing. Lowden was too quick for us. For a freezing moment I thought that we were doomed to follow the skipper and mate, for there he was, his free hand on the tiller, and the revolver covering us in turn, swaying like a snake's head slowly between us.

"There was no trace of the fo'c'sle in his voice as he sang out, "*I—sail—this—ship.*"

(To be continued.)

THE CHOLERA IN CONSTANTINOPLE.

THE terrible outbreak of cholera at Constantinople, apart from the great effect which it will have on the final issues of the war, raises several most important considerations for us in Britain as to how it may affect our immediate interests.

One of the most effectual means of checking the spread of infection in such outbreaks is the cremation of the dead and their clothing; but this measure is to a great extent barred in the case of the Turks, who, like all Moslems, have the strongest religious objection to this method of disposal of the dead, and we learn that in the lines of Chatalja the suggestion and carrying out of this procedure has met with the expected objections and opposition. It is well known that on the Indian frontier the threat that, if captured and executed, their bodies would be burned had a most deterrent effect upon fanatical Mohammedan Ghazis, who look upon the murder of a Christian as a sure passport to heaven; and 'Thou son of a burned father' is one of the most opprobrious terms of abuse among such people.

Cholera is the best instance of a water-borne disease, and the greatest danger of its spread is from the dejects of sufferers from the disease gaining access to wells, reservoirs, rivers, &c.; but instances are on record of its spread by clothing, and after the war is over the importation of rags from Constantinople will have to be carefully watched. Doubtless the battlefields and routes of retreat will be exploited by dealers in this unsavoury class of merchandise; and, besides the germs of cholera, those of typhoid fever, smallpox, &c. may lurk therein for a long time. We have not forgotten the outbreak in a train-ship of typhoid fever traced to the importation of infected blankets after the war in South Africa. Britain, owing to her insular position, is less likely to become infected with cholera from personal transmission than any other country in Europe, owing to the ease with which cases can be detected on entry, and to the excellent water-supply of all but the smallest village communities; but for some time it will be very dangerous for ships to take in a supply of drinking-water at Constantinople or any Black Sea or Levantine port, and cases of cholera due to carelessness in this respect have already been reported.

The disease is also very likely to be carried by the sick and wounded to the cities of the Balkan states; and in such cases it is remarkable how quietly and insidiously it begins, patients simply collapsing and dying without the characteristic symptoms of the disease becoming prominent. But, as already stated, the probability of Britain becoming affected from the seat of war is very remote. The spread of

the disease is always by personal transmission, and not by the air, as in the case of influenza, measles, &c.; that is, it never travels faster than do human beings, and it should be possible, though it is not so always, to trace every case of the disease to infection from a previous one.

The original home of cholera is the valley of the Ganges, and all epidemics start from that locality. Whereas formerly the disease spread thence along the land trade-routes, in the present day infection is frequently carried by steamships; and the Turks doubtless acquired it through the pilgrim trade to Mecca, whence it is spread far and wide throughout the Moslem world. The infection of individuals is brought about through their swallowing the germs of the disease in drinking-water or contaminated food. In primitive communities, where the drinking-water is obtained from surface pools, wells, or streams, the danger of contamination is obvious, for sufferers from the disease, which always causes raging thirst, of course crowd round the water and foul it with their vomit, discharges, or dirty hands. This is the method by which the disease has been spread in the recent outbreak in Turkey. In Britain, where in almost all parts we have a good, pure water-supply flowing through pipes, such outbreaks are impossible except in country districts; and where water is doubtful in quality safety may always be secured by boiling it before consumption; while in the navy and on board other ships condensed water is a perfect safeguard. In India the practice of purifying wells with permanganate of potash is now generally adopted, and a most hopeful method of treatment of the actual disease is the administration of large quantities of this drug in the copious draughts of water for which sufferers have an intense craving.

The necessity for protecting all food from contamination by dirt and flies, and the avoidance of uncooked vegetables, is obvious; and I cannot close this article better than by narrating some incidents, culled from my personal experiences, showing how outbreaks have been caused.

A shopkeeper in a hill-station in India had a soda-water-making machine, the water for which he obtained from a well by the roadside. This well was used by pilgrims passing along the road, who obtained water by lowering into it their brass *lotus* from which they drink, and which they also use for washing their persons after attending to the calls of nature. The prevalence of cholera synchronised with the soda-water manufacturer's filter being out of action, and the result was an outbreak of cholera among the consumers of his wares. This *lotus* question is a very serious one in India, where most of the drinking-water is got from wells; and among the experienced European residents the lowering of

a *lota* into the domestic well is treated as a most serious offence, demanding the instant dismissal of any native servant caught doing it.

In the same station the water-supply for the troops was obtained from springs a mile or more from the main pilgrim route, and was carefully protected. Unfortunately, just above the springs was a small level space, which the pilgrims discovered and used as a camping-ground; the presence of an abundant water-supply being doubtless an additional attraction. The result was a serious outbreak of cholera in the station.

An appalling outbreak of cholera took place in another station, resulting in the death of about ninety men in a few days from the filling of the filters with sand from the bed of a con-

taminated stream. It was the irony of fate that through this oversight the filters, which were intended to be a safeguard, were the source of the disease! Since that time filters have gone out of use in the army to a great extent, though filter water-carts are still used on manœuvres and on active service.

An outbreak of cholera among the officers of a regiment was proved to be due to a strainer used in cooking the mess dinner having been washed in a stream which ran near the cook-house.

A soldier attending on some cases of cholera in a recent war on the Indian frontier contracted the disease through putting a piece of ice into his mouth with his dirty hands.

THE SERGEANT'S LUCK.

CHAPTER IV.

NO sooner had the two rogues left than we went into the wood and buried the body of the Italian; but before doing so we searched it, and, to our unbounded surprise and delight, found four thousand pesetas, which we divided equally between us. We found too some very good cigars, so under the trees the time went pleasantly; but as the hours passed we began to be anxious at the non-return of the two bravoes.

While they were on the road between us and our destination we dared not leave our hiding-place. Surely, we thought, they must come soon; but no, there was not a sign of them. The shadows lengthened, the sun set, and the warm summer night fell. We were at our wits' end to know how to proceed.

'Depend upon it,' said José, 'those two *vagabondas* are dead-drunk in some *venta*. It must be near ten now. I know the country, and we will get off the main road as soon as we can. Come on; let us go.'

So we saddled the mules and set off.

We had not left the wood far behind, when, coming round a sharp corner, we saw the two ruffians trotting towards us. It was absolutely impossible for us to avoid them. My spirits rose in a moment, but I bitterly regretted that I had not got my sword. José, however, looked at the matter in a different way; he was brave enough, but more cautious.

'*Cielo!*' he exclaimed, 'we are in for it now; but you leave it to me. I know my countrymen better than you do.'

I thought, as a soldier, I ought to deal with them; but perhaps he knew best, and we rode forward.

'*Buena-noche, señores,*' said the one on the brown horse, slackening his pace. 'We are strangers in these parts, and my friend and I have lost our way.'

'Have you, you liar?' cried José. 'Perhaps

this will help you to find it.' There was a bright flash, and the fellow fell forward dead on to the crupper of his horse.

The horse of the other man, startled by the shot, shied and reared.

'Fire,' roared José to me, 'or we are done for!'

I did so, but whether I missed the man or not I could not tell, as his horse bolted. We set off after him; for if he escaped we should not have been much better off than we were before. Mules are no match for horses, but his poor beast was tired and our animals were fresh, and we kept him in sight. The rogue had not gone far ere he slackened his pace and got off, and now it was evident he was badly wounded, as he dragged himself towards a field of sugar-canes.

We knew he would not trouble us any more that night; so, taking his horse with us, we set off again, arriving at our headquarters just as the reveille was sounding.

The colonel was pleased at the information I was able to give him regarding the strength of the English garrison; and I was warmly congratulated by my comrades on my good fortune, for very few thought I should ever get a peseta.

A few days afterwards De Goni set off. He did not succeed in getting a commission in our service; but, thanks to our colonel's recommendation, he gained one in the Polish service. He went to Moscow; and, what's more, he came back, bringing with him a wonderful ruby, for which he got a great price. He rose to be a captain. When peace was declared, as he had a knowledge of the cultivation of the vine, he bought some land in the Gironde, and married the daughter of a rich landowner. I should say from his letters that there are few happier or more prosperous men in all those parts.

Fortune hitherto had treated me well—too well

perhaps to continue—and soon after José's departure, by a wound in the foot in a mere skirmish, she put an end to my military career. From the first the medicine-major said it would be a long affair, and for a month I was in the hospital, and for weeks went on crutches; and as the doctors all agreed that I should be lame for life—though they were quite wrong, as it turned out—I was gazetted out of the service with a pension.

Ere I started with the convoy for France, Lieutenant Finoy gave me a letter to his father, who he told me would give me the equivalent of my Spanish money and notes in French money. By the time I reached Paris I had got rid of my crutches and was able to hobble about with a stick.

Nothing could have exceeded the kindly way the good banker received me. For an hour or more he questioned me about his son's prospects and my own.

'My son tells me in his letter,' he said, 'that you have got several one thousand peseta notes to change.'

'Yes,' I answered, 'I have got sixteen of them altogether; but I have been told that they are only worth seven hundred and eighty francs each in France.'

'Ah sergeant,' he laughed, with a twinkle in his eye, 'you won't teach me much in the way of banking! Those who told you that wanted to get them.'

'Is that so?' I asked, not understanding what the intentions of the kind-hearted banker were.

'Let me look at them,' he said. 'Yes, they are worth twenty thousand francs.'

'Ciel!' I replied, not able to repress my astonishment.

'Well,' he said in a kindly voice, 'if they are not quite worth that, we will say they are. You saved the life of my only son, and that's enough for me. Now I will tell you what to do,' he continued. 'I'll place ten thousand francs in Rentes, so that you will never want. I will invest four thousand for you, and you take six thousand.'

Then he wanted to know how long I could stay in Paris, so I told him all about Françoise, and how I wanted to see her as soon as possible to discover if she would marry me.

'She's a fool if she does not,' he said. 'You let me know about that as soon as possible, because you may tell her from me that I am going to pay for her trousseau. There will be some papers to sign, so you will have to come here again, and then I hope you will bring your bride with you. No, no, don't trouble to thank me,' he continued. 'Now, *adieu* and *bonne chance*.'

I left him, quite overcome by his kindness, and thanking God that there were such good people in the world.

I left the next day long before it was light.

It was bitterly cold at first, but soon the sun shone brightly. As the day advanced it became cloudy; and as I got down at 'Le Chat Botté,' which was on the highroad between Abbeville and Amiens, and not far from our farm, it began to snow. The jovial landlord, Père Meudoner, was standing at his door.

'*Parbleu*, sergeant!' he cried, 'you have been caught this time. *Ma foi!* you do hobble. But come in and tell us all about it.'

I naturally asked eagerly after my parents and Françoise.

'They're all right,' he answered. 'Françoise has gone to the market. She will be here soon, as she promised to buy some gloves for my wife.'

'Do you think she will have me now I am lame?'

'Have you?' he exclaimed. 'Why, she never passes the door without asking me if I've seen any soldiers, and whether they know anything of you.'

'She's a beauty!' I exclaimed in delight.

'But tell me,' he said, 'what amount of what we soldiers'—for he had been in Egypt—'call "business" have you done?'

'To the sum of twenty thousand francs this time,' I replied.

'*Parbleu!*' he exclaimed, 'that's more than I ever did myself in one campaign. Look here,' he continued, leaning over the table and filling up my glass, 'you should buy this inn. You could smoke and drink at cost price all day and half the night, and make money at the same time. What more could you want? With a girl like Françoise to look after things and do all the real work, you would be living in Paradise.'

I was quite taken aback for a moment by his proposal. 'Yes, it certainly sounds very lovely,' I said. 'But if it is so nice, why are you giving it up?'

'Because my wife has come into some house property in Paris that will enable me to live like a fighting-cock for the rest of my days without doing a stroke of work. It's a perfect gift; but you can have the inn for four thousand francs, and the field behind for one thousand francs.'

'Done,' I said, 'if Françoise agrees.'

'Well, you will soon be able to find that out,' he answered; 'for, hark! here she comes. I know the trot of the old white horse.'

'I've got the gloves!' she cried in the dusk to the landlord.

'Françoise, *ma chérie!*' I shouted, 'it is I,' and I hobbled towards her as fast as I could, for she had suddenly pulled up some distance from the door, and stared at me as though she could not believe her eyes.

'*Oh mon pauvre Henri!*' she cried, 'you are as lame as a duck;' and in a minute she was out of the cart and her arms were round my neck,

as she kissed me again and again. 'Allons, let us get home!' she cried.

Ah, what a happy evening that was! What lots we had to tell each other! Little she or I cared, as I sat with my arm round her waist before the blazing fire that winter night, for the bitter cold or the snowstorm that was by that time raging without. What grand plans we made for the future, and how happy she was at the prospect of being *la patronne* of 'Le Chat Botté'! Old Père Dubusson, too, entered into that arrangement; though, as he drank himself to death within six months, he did not get so much out of it as he had hoped or expected.

Six weeks afterwards the wedding came off. Never before had the girls in those parts seen anything like the trousseau which the good banker had sent down, and never had the men had such a glorious carouse as they had at that wedding, which took place at 'Le Chat Botté,' because old Dubusson's cottage was not large enough.

Maudonier had agreed to keep on the inn till I returned from Paris, where I had to take my bride, according to my promise, to see Monsieur Finoy, and to sign and receive all the papers of the stocks he had bought me.

'Come upstairs, sergeant,' said the good

banker; for, rich as he was, he lived over the bank. 'I promised the ladies this time that they should see you.'

Madame and the two girls—both the latter were strikingly pretty—were worthy of the banker, and I cannot say more than that. Had we been relatives they could not have welcomed us more warmly; but nothing pleased me more than their praise of Françoise, who—though she was rather shy in such grand company—looked very handsome in her new clothes and her pretty linen cap (which madame told us she had chosen herself), fluted in front in the form of a fan, and stuck up at the back, only more sharply, like a little wren's tail.

Now my wife was both shrewd and clever, and while she was *la patronne* of 'Le Chat Botté' the inn became famous far and wide for its cuisine, and many travellers who would otherwise have halted at Abbeville or Amiens came to us; but, heavy as her duties were, she never neglected her large family.

I am old now; but as I look back I see that I did very well, at any rate for a trooper, at Toledo; and I did even better, as I have shown, on my second visit to Spain; but the greatest piece of luck that ever I had in all my life was in marrying Françoise Dubusson.

THE END.

BYRON AND GREECE.

By GEORGE PIGNATORRE.

ALTHOUGH the simple white-marble monument erected to the memory of the great poet in the small Greek town of Missolonghi does not cover his remains—which were laid to rest in Newstead Abbey—it marks, nevertheless, the spot where he died a victim to his fearless devotion to a holy cause, thus effacing in the grandeur and nobility of his end the memories of former frailties which, if they could not dim the fame of the poet, had cast a shade over the reputation of the man.

The year 1823, which beheld Byron's departure for Greece, was closing with fair prospects for the Greeks, who had discomfited by land and by sea their numerous foes. Dramali's army of over thirty thousand men had been almost annihilated by eighteen thousand Greek guerillas; the line-of-battle ships and frigates of the Ottoman navy had been overmatched by the small armed brigs and fire-ships of the Greeks; the squadrons of Hydra, Spetsæ, and Psara, under Miaoulis, Tombazes, Kanaris, and other valiant sea-captains, had sunk or captured vessel after vessel of the enemy, and they now rode triumphantly over the Ægean; all the strongholds of the Peloponnesus, save Patras, had fallen into the hands of the Greeks; the invading Turkish hordes had been beaten back in the eastern and western central

provinces; Ætolia, Attica, and Boeotia had been cleared of enemies; the Turks in Crete were confined to the few walled towns on the coast.

Briefly, the greater portion of the territory forming the actual kingdom of Greece—exclusive of the Ionian Islands, then under the protection of Great Britain, and of Thessaly, which was annexed to Greece in 1878—was free of foes. The outlook had never been so bright for the patriots since the breaking out of the revolution three years before. Indeed, humanly speaking—for the dark cloud of war from the south which was to blacken the horizon had not yet arisen—final success seemed already certain even to those who had viewed the varying fortunes of the struggle with misgivings, provided sufficient funds could be raised to meet the unavoidable expenses—the expenses of another campaign. The cost of providing for the equipment of the rude levies of peasants and shepherds composing the land forces, and of the armed brigs and schooners, of the insurgent Greeks had been defrayed by individuals. The chiefs had armed at their own expense or out of voluntary contributions the poorer of their followers; the wealthy shipowners of the three maritime islands had supplied the sinews of war for the fleet; but these resources were now failing, in

spite of captures from the Turks and the occasional seizure of warlike stores. Ammunition and ordnance were scarce or inefficient; the squadrons which formed the mainstay of the cause in a country so indented with gulfs and bays, so exposed to an invading force from Egypt or Algiers, would be unable to keep the sea, to revictual besieged seaports, intercept convoys, or prevent the landing of an expeditionary force. The guerilla bands would be less able to keep the field with deficient means in a country ravaged from end to end, which could hardly yield a scanty sustenance to its defenders, and in which neither powder-mills, foundries for casting cannons, nor gun-factories existed.

The only hope of bringing the contest to a swift end seemed to rest on the chances of obtaining foreign subsidies, in the form of loans or contributions; and to the attainment of this primary object Byron bent all his energies and devoted his private fortune. His eagerness to join actively in the terrible strife and to assist the 'good cause,' as he aptly described it, determined his departure from Argostoli, on the 28th of December 1823, for Missolonghi, then the chief town of western Greece, which he reached after having been chased by a Turkish frigate, and losing his companion, Count Gamba, his horses, and eight thousand dollars in specie, captured in one of the two boats in which Lord Byron and his following were endeavouring to escape from their pursuers.

Notwithstanding these untoward events, of which the loss of the money was the most serious, Lord Byron was able to bring safely with him about sixteen thousand dollars in specie. Now sixteen thousand dollars formed no despicable sum in those days in a country in which fifteen hundred dollars would have sufficed to maintain in full rations, and at a higher rate of pay than the Greek Provisional Government could afford to give, a body of one hundred men for three months—a country in which twenty thousand dollars, or four thousand pounds sterling, was, in Byron's words, 'likely to set an army and fleet in motion for several months.'

The arrival of the English patrician—bringing with him substantial pecuniary aid, and the prospect of more in the shape of a foreign loan—whose name was already a household word among the better-educated Greeks as the champion of freedom in its broadest sense, as the bard who had sung of Greece even when Greece had been 'living Greece' no more, aroused an enthusiasm which no one else could have awakened in an equal degree, and inspired a confidence in the future fortunes of the struggle. It was certainly one of the most notable events of the long strife which was to be waged with varying fortunes for over seven years. It was perhaps more

than that—it was an event which influenced decisively the after-course of the struggle; for though Byron's all too brief career was cut short four months after his landing at Missolonghi, ere he was able to realise any of the operations he had projected, his example gave a fresh impulse to philhellenism, and drew to the standard of the Cross such men as Cochran and Church; and his devotion to the cause of liberty was not destined to remain barren of results.

As in the case of Bonnie Dundee, death, met for a principle, threw its mantle over a not faultless past, the brightest hues of the two men's iridescent character flashing out at the last; the severities, and worse, of the one, like the far more pardonable frailties of the other, were and have been forgotten in the nobility of his end. And though Byron's weaknesses were common enough among men of his rank, and more excusable in one whose personal attractions rendered him ever a welcome wooer, they acquired a darker hue from the very brilliancy and loftiness of his genius and general character. In strong contrast with his reckless selfishness in his relations with the other sex is his forgetfulness of self when defending the oppressed or succouring those in peril. When the Austrians were marching on Naples in 1821 to crush the ill-concerted, premature Liberal movement, which indeed collapsed like a pricked bubble at their approach, Byron writes: 'Letters opened? To be sure they are, and that is the reason why I always put in my opinions of the Austrian scoundrels. There is not an Italian who loathes them more than I; and whatever I could do to scour Italy and the earth of this infamous oppression would be done *con amore*.' And doubtless had the Neapolitans shown fight he would have thrown himself into the struggle; but, as I have said, the revolution flickered out tamely enough. Byron, like his brother-bard Moore, must have turned away in scorn and disgust from the spectacle of a recreant people and army fleeing before their foreign invaders without striking a blow. His fearlessness in the greatest perils, his indifference to consequences when others needed assistance, are no less conspicuous. Many instances of these two traits might be quoted. Two of the best known are very characteristic. During Byron's stay in Ravenna a superior officer—a very brave man, by the way, according to the poet, but guilty probably of having done his duty without fear, if not without favour—was shot down and mortally wounded in the very street where Byron lived. As no one ventured to approach the dying man, who was gasping out his life unaided in the middle of the thoroughfare, Byron—though warned that he was running certain risks from the assassins or soldiers in interfering, and in fact threatened by some soldiers

who possibly mistook his intentions—succeeded in having the wounded man conveyed to his (Byron's) home, to the horror of all, and of his own immediate attendants more especially. The deed may appear to British readers a simple and natural act of humanity, but to those who have a knowledge of the times it will appear what it was—a daring act which few would have ventured on, and which even Byron would not have risked with impunity had he not been a British subject. Some two years later, during his residence in Cephalonia, he had taken up his abode in a small house in a village situated some seven miles from Argostoli. The house is still pointed out as Byron's residence, and has remained in much the same condition as it was when he left it in 1823. Close by the village there were several of those crinolite-pits which are so common all over the southern portion of the island, the substance being a white clay of a very friable nature. The walls of these pits or caves are liable to crumble and fall in when they are excavated to an unusual depth; and on one occasion the sudden collapse of the sides of a pit had entombed two workmen, who inevitably would have perished had it not been for the presence of Lord Byron, who rushed to their assistance with characteristic ardour, and, seizing a spade, shamed the by-standers out of their apathy and caused them to join in the task of rescue.

Thus when he landed at Missolonghi some of his many acts of humanity and courage must have been known, or become known, and have assisted in winning for him golden opinions from all men. He lost no time in justifying the sentiments he had inspired, and set himself resolutely to the task of healing the dissensions which had sprung up among the Greek guerilla chiefs and members of the Provisional Government, restraining the insubordination of the rude levies, and improving the defences of Missolonghi, then the bulwark of western Greece. To the attainment of these three objects he directed all the energies of a strong will, braced still further by the earnest faith of partisanship. And if he did not succeed in eliminating the seeds of discord which existed among the leaders, or the spirit of unruliness in their followers, he certainly lessened the attrition in many cases, and acquired a degree of moral sway over the Suliotes—perhaps the most valiant defenders of western Greece—which would have enabled him in time to discipline their wild valour and fashion it to obedience.

Nor was Byron's conduct less admirable when he was endeavouring to soften the horrors of the ruthless warfare which had been waged, without mercy, between Christian and Moslem. Up to the date of Byron's arrival quarter had been seldom given by either side. Wholesale massacres and unspeakable barbarities committed by the Turks had provoked reprisals; captives had been slain in cold blood; even capitulations sworn to on the Koran or the Scriptures

had been openly violated; in short, the war had hitherto been one of extermination. Byron strove strenuously to introduce at least a more merciful treatment of prisoners. During the first two months following his arrival he obtained the release of fifty-seven captives—men, women, and children—and had them conveyed to Turkish ports at his own expense, in each case addressing a letter either to the Turkish authorities or to the British consul of the port, in which he expressed a hope that in return all Greek prisoners of war would be treated with humanity. The generosity of his act and his high rank added weight to his intercession, and produced some good results, and would have produced more had he lived longer. No other man could have effected so much; for it must be remembered that the conflict was one of race, of antagonistic faiths, of master and slave. And when the atrocities committed by Christians on Christians during the Peninsular war are remembered, those committed by the Greeks on the Turks in retaliation are more excusable.

His efforts to maintain order and prevent civil strife were also partially successful in the case of the feuds among the Greeks themselves, whom he understood better than most foreigners, and who would listen to him if they would listen to no one else. But all his exertions were of little avail in promoting a feeling of good-fellowship among native partisans and foreign volunteers. Language, customs, and ideas were so different and antagonistic that frequent affrays were inevitable; and in one of these a Swedish officer was killed by a Suliote, who was in his turn wounded severely. The Suliotes to a man sided with their comrade, who had been guilty of a breach of discipline they were unable to understand. The friends of the officer who had been killed were naturally more than indignant, and for a moment a conflict seemed impending between Suliotes and Philhellenes; but the cloud blew over, thanks in a great measure to the personal efforts of Lord Byron. However, though he had succeeded in averting actual conflict, he was unable to calm the fears of the British artificers and mechanics under Parry, who, deeming themselves in jeopardy, took their departure. Among these was a certain Brownbill, who was also in his hours of ease an amateur missionary; and on leaving he deposited with Lord Byron numerous Greek Bibles for distribution among a reluctant clergy and laity. The ignorance and prejudices of the former being naturally arrayed against innovations which they, as the servants of a fossilised Church, could not understand, and therefore condemned, Byron found his work cut out for him when he undertook to distribute these new Bibles in modern Greek among the orthodox. However, thanks to that unflinching tact and good-sense which he always displayed in serious matters, the clergy were being won over to consent to the distribution when the

blow fell which bereft Greece of her foremost friend.

In spite of the flight of the English artificers, Byron's influence among the native soldiery remained unabated. The insubordinate but truly valiant Suliotas had been brigaded, and were placed under his immediate and independent command. His presence at Missolonghi was, to quote a passage in a letter written by him to Dr Kennedy on the 21st of February 1823, to prevent 'confusion from becoming worse confounded,' and would therefore, *a fortiori*, have been needed under the walls of Lepanto. There is no doubt whatever that, had his health remained good and proof against the ceaseless harassing cares which beset him, he would have been fully warranted in not moving from Missolonghi; but as his health had been failing for some time under the strain of constant worry and fatigue, which had culminated in an attack of epilepsy on the 15th of February, it would have been advisable, not only for his own sake but in the interests of the cause, to remove into healthier surroundings. It had been well for all if he had at this juncture been induced to leave the marshes and fens of Missolonghi; but he was so earnestly devoted to the task he had undertaken (to which he had bent himself with that thoroughness which marked all his actions), and so fearful of being misunderstood, that he scorned to consider the personal consequences involved in his stay, although he was ready to transfer himself anywhere. As he wrote in a letter addressed to a certain Parruca of Nauplia, 'I am ready to go anywhere, either as a mediator or, if necessary, as a hostage.' Aware of the precarious condition of his health, he seems to have had at times a foreboding of his approaching end; and the strain of sadness which pervades his last poem, which he penned on the completion of his thirty-sixth birthday, may have reflected this feeling. Into these noble and affecting verses he breathes his weariness of life and desire for rest. The feeling was well-nigh prophetic. A few days later, on the 9th of April, he was seized with a severe chill, brought

on by exposure. While taking his wonted ride he had been overtaken by a sharp shower and thoroughly drenched. The next day feverish symptoms set in, and his condition became so serious that his medical attendants feared the worst. There was no rally, and he expired on the 18th of April 1824, after a nine days' illness.

His death was mourned by a whole people, who felt, and rightly, that they had lost their firmest friend. No mark of respect was omitted which might serve to attest their grief for the loss of one who had laid down his life in their cause.

Thus died Byron, in the prime of life and in the zenith of his fame, which had already raised him above even his most illustrious contemporaries. Coleridge and Wordsworth, Moore and Scott, bright stars as they were in the galaxy of poets which adorned the opening years of the nineteenth century, were outshone for a time in the public eye by the effulgence of Byron's genius; and though the years which have flown since he met his end have seen a decline in his reputation in his native Britain, the author of *Childe Harold*, of the *Giaour*, and of *Cain* is probably as popular as ever on the Continent. But if praise has been the lot of the poet, very grudging has been that awarded the man. Full justice has in many cases been rendered to the literary merit of men of whose private lives we know little and care less, whom we by no means wrong by ignoring outside the world of letters. But this one-sided view is by no means applicable to Byron, whose brief career was as eventful as his writings were varied, who was a man of action as well as a man of letters, who united much practical good sense with poetical imagination, who closed a chequered existence in translating into action his sympathy with the oppressed, in realising some of his noblest aspirations. It is to this side of Byron's character that scant attention has been drawn; it is to these noble qualities of the man it reveals that justice should be rendered by the general public, who would judge fairly if their judgment were less clouded by ignorance or prejudice.

THE MONTH: SCIENCE AND ARTS.

THE PATHESCOPE.

FROM time to time we have described in the 'Month' the ingenious attempts made by inventors to produce apparatus for showing moving pictures in the home, and now success appears to have been achieved with the pathescope. This is a small machine, occupying no more space than a phonograph, which can be set up on a table, and, as with the magic-lantern, the size of the picture may be varied within certain limits by the distance between the projector and the screen. Hitherto the great objection against

this development has been the combustible nature of the celluloid film; but this drawback has been completely overcome by the use of a non-inflammable film made from acetate of cellulose. Though the picture thrown from this base is not so clear and fine as that obtainable with the celluloid, with the home machine and the small picture the defect is not so pronounced as in the case of a large picture in a hall. In order to ensure that only a non-inflammable film shall be used, the edges of the film have a varied perforation; that is to say, there are more holes on one edge than on the other. Accordingly the in-

flammable film with the standard perforation gauge cannot be used. This is a very interesting development, but it suffers from the great disadvantage that the films are costly. To meet this objection, the idea of a library has been evolved, the films being exchanged from time to time, as is done with books. The establishment of dépôts in the large centres will facilitate the exchange of films; but as users in country districts can only effect an exchange by post, it is doubtful if the project will survive the first wave of enthusiasm. Mr Edison has perfected a similar small machine for the home; but as the films must also be purchased, the expense, coupled with the fact that the novelty soon wears off, is an adverse factor. The true solution of the cinematograph-at-home idea would seem to rest in the Bettini invention, which has been described in these pages, as the cost is trifling. The inventor of this system has discovered a means of using a non-inflammable film base, in preference to glass, so that the disadvantage of breakability is absent. The pathoscope, however, is the first commercial application of the idea upon rational lines, and undoubtedly there are many homes in which animated pictures will appear as a diversion. It is also anticipated that a demand will arise for the appliance, which is cheap, for use in schools; this certainly appears to be its most promising sphere of application.

THE PROFITABLE DISPOSAL OF SEWAGE.

The first commercial application of the sewage sludge disposal system evolved by Dr Grossmann has been begun in the north of England. The problem of handling this material has been one of great complexity for many years, because, whether it is dumped into the sea or distributed over the land, the scheme has suffered from the defect of being contrary to hygienic principles; while the residue, the fertilising qualities of which were thought to be of great value, has been discovered to be worthless. In the Grossmann process the fatty constituents which escape down the sinks from sculleries and destroy the manurial properties of the sludge are separated, reclaimed, and turned to commercial use, as they are valuable. By recovering these fatty substances the fertilising qualities of the sewage are restored, so that the sludge becomes a substance of profit instead of waste. The plant which has been laid down is capable of dealing with the sewage from a town of one hundred and forty thousand people, and the treatment is automatic throughout. The sludge is drawn off from the settling-tanks in a thin, semi-liquid mass and pumped into a draining-tank. Here it is reduced to a slime, then transferred to a storage-tank, which feeds a series of hoppers, from which it falls into the driers. These are large cylinders like retorts, bricked in and heated by coal. Means are provided of keeping the sludge in movement

as it passes from the entrance to the outlet of the cylinders. As it issues it is perfectly dry, and in this condition is a first-class fuel, which may be used to feed the furnaces for further drying. In some districts this might be a method of disposal preferable to the reclamation of the fatty constituents and the fertiliser; but if the latter are the prime considerations, then the dried sludge passes into distillation retorts, where it is associated with a small proportion of acid and subjected to a current of superheated steam, which carries off all the greasy substances. The fat-laden steam is led to condensing-towers, where the fat is reclaimed. The residue is drawn off from the retorts in the form of a brown, odourless, and perfectly sterilised powder. As this contains about 40 per cent. of humus matter, it is rich in the essential ingredients for the stimulation of the soil; and the matter, being odourless, can be handled without creating a nuisance. Tests have proved that this powder is equal in its fertilising properties to the crude humus, which was so freely distributed over the land before the introduction of modern sanitary methods, and which is still distributed to this day in remote country districts. As this sterilised and odourless powder can be put in bags like guano, it may be conveniently exported, and should be in keen demand in those countries which are deficient in fertilisers, but where, owing to ignorance of proper methods of agriculture, the soil is in urgent need of nutrition. The process is absolutely self-supporting; in fact, an appreciable profit is possible, as the grease alone should realise sufficient to defray the cost of the operations. As the process is automatic, labour is reduced to the minimum; while, as no noxious fumes escape into the atmosphere, the sewage-works cannot be reckoned as a nuisance to the community, any more than can the ordinary refuse-destructor.

ADDING MOTOR-POWER TO BICYCLES.

The bicycle in these days of cheap manufacture and standardised methods is ubiquitous, but the majority of those who have to depend upon the pedal cast envious eyes on those of their confrères who possess machines with motive-power. The motor-cycle, however, is often beyond the reach of the masses—it is a luxury. Many efforts have been made to devise a small attachment for the purpose of imparting to the ordinary machine mechanical propulsion, but with very little success. The latest idea in this direction has more promising features, as the device is ingeniously and scientifically designed, substantially built, and inexpensive. It comprises an additional wheel, measuring twenty inches in diameter, which carries the essential motive-power, consisting of a small engine and its attachments. This is coupled to the rear axle of the ordinary bicycle. Pivotal connection is made in such a way that under all conditions the auto-wheel maintains a position

parallel with the back-wheel of the bicycle; also, the power-wheel can be attached and detached in a few seconds. The additional wheel is complete in every respect, the petrol-tank being mounted above the mud-guard. The control is very simple, and lubrication is automatic. Perfect adhesion is secured, as the wheel weighs thirty-four pounds; and although the power of the engine is not sufficient to keep the machine going up steep inclines under its own mechanical effort, pedal assistance is required only to keep the engine running at top speed. The machine is wonderfully steady in rounding corners, and on slippery surfaces the auto-wheel, being smaller than the driving wheel, and mounted beside it, effectively checks all tendencies towards side-slipping.

A CALCULATOR FOR IRON AND STEEL ANALYSTS.

Though the work of the chemist engaged in the iron and steel industries is somewhat special, the ranks of this profession are growing so rapidly that attention may be called to a new calculator which will save a vast amount of time in connection with the estimation of the proportions of manganese, phosphorus, silicon, and sulphur in iron and steel. The device resembles the clock type of calculator employed in accountancy operations, and is six inches in diameter. On the face are four rings of figures, carried to four places of decimals, referring to the four respective constituents, while an inner ring gives the weight of the precipitates. All that is required is to turn the hand so that it traverses the weight of the precipitate, and then by following the index to the outer circle, owing to its passing through the percentages of the four constituents relative to the weight, the calculation can be completed almost instantaneously. The figures have been obtained from several thousand estimates in each case, so that the result is absolutely reliable. Not only does the calculator save a large amount of time, but it affords a perfect protection against error.

ELECTROPLATING ALUMINIUM.

Hitherto the electric deposition of a foreign metal upon aluminium has been a problem of some perplexity; but all difficulties appear to have been overcome in the process which has been perfected by a prominent German company which is now exploiting the patent. The aluminium to be treated is first cleaned in the usual manner. It is then immersed in an acid solution, heated, and simultaneously treated to the action of a reducing agent, such as alcohol, which prevents the reaction being too rapid. After resting in this solution for a short while, the aluminium is transferred to an ordinary electroplating bath. It is stated that the plating of aluminium by this new process is absolutely permanent, and the plated surface polishes brilliantly. In order to test the adhesiveness of the deposit secured by this treatment, articles

composed of aluminium so coated have been submitted to stringent tests. Specimens have been heated in a Bunsen-burner and then plunged suddenly into cold water. No signs of fracture in the plating have been observed. Moreover, the metal can be bent almost double, and the plating will not crack until the aluminium itself breaks. A wide range of metals, such as gold, silver, copper, and nickel, can be electrically deposited upon aluminium in this way. Seeing that the demand for aluminium is very keen for a variety of purposes owing to its lightness combined with strength, although at present its use for many purposes is impossible because of its remarkable oxidising properties, a cheap method of galvanising or electroplating it should meet with success.

THE VIOLINA-PIANOLA.

A remarkable mechanical piano-player, in which violins are combined with the piano, has been placed upon the French market. The instrument comprises the ordinary type of pianola; but above it, and centrally mounted, are disposed three violins. The bow is a hoop of horsehair, which, when the instrument is started, commences to revolve, and continues rotating at a steady, regular speed, and in such a way that it plays upon the strings of the violins in the same manner as a bow wielded by a maestro, the action being rotatory instead of to and fro. By an ingenious mechanical arrangement the pressure of the bow upon the strings can be increased or decreased as desired in accordance with the expression-marks upon the musical score. The notes are obtained by the aid of mechanically operated fingers which press upon the strings; while another device, by tightening or slackening the strings of the violins, ensures that the instruments will be in constant tune. The violina-pianola is actuated by electricity. The rendition is remarkably faithful and free from all harshness. This ingenious combination of the piano and violin very appreciably widens the possibilities of automatically rendered music, and the effect of the violins, it is said, is equal in delicacy and tone to that produced by a master-hand.

AN INGENUOUS BROOM-ATTACHMENT.

As a rule, when a housewife buys a new broom the handle is attached to the head by insertion in a hole in the back of the brush, rigidity being secured by driving a screw or nail at an angle through the hole, so as to clinch the end of the handle to the head. Continued hard use is apt to loosen the handle; and as the broom always wears out first, it is not an easy matter to withdraw the handle for use with a new head. An ingenious Frenchman has devised a simpler and easier means of attaching the two. One end of the broom-handle is given a conical point, and over this is

slipped a tapering spiral steel spring. The hole in the broom is provided with a thread cut in the wood, and the handle is connected by simply inserting the spring-covered point and screwing up. While this is being done the spring becomes tightened and grips the end of the handle, and is simultaneously pressed tightly against the thread in the brush-socket. Consequently the one cannot come away from the other except by unscrewing, and no amount of wear and tear will loosen the attachment. When the brush is worn out, a few twists only and the handle, with the spring, is detached, ready for insertion into a new brush.

A MOUNTAIN RAILWAY THROUGH SPACE.

Visitors to the Tyrol are now provided with a new sensation. We have all become familiar with mountaineering by rack-railway up some of the steepest peaks in Switzerland; but the Kohlererberg in the Tyrolean Highlands is now scaled by an aerial railway. From this crest a magnificent panorama is unfolded over the whole Ortler range. The ropeway, carried on twelve massive steel supports, lifts the passengers over an altitude of three thousand eight hundred feet. There are two tracks and two cars, one ascending as the other descends. Each car has accommodation for fifteen passengers. Travelling through the air in a box-like compartment, slung from an overhead wire, may not appeal to the timid as a safe method of transportation; but there is no danger of accident in this instance. Every possible contingency has been provided for. The car, although suspended like a pendulum, cannot swing, but is held firmly in a vertical position. Neither can it be derailed. Electricity is the motive-power employed, and should the main current fail from any cause, there is a reserve battery capable of running the railway for several hours continuously until the main current is switched on again. The cars cannot run away down the aerial declivity, as ample and varied braking facilities are incorporated. In fact, a fatal accident is impossible unless the two ropes on which the eight pulley-wheels travel should snap—a possibility which is too remote to demand consideration. Should the driving machinery break down so that the traction ropes become inoperative, the car can be hauled in by means of an emergency capstan. Or should a car for some reason or other stop suddenly, and refuse to move either forward or backward, one of the emergency cars kept at each station is sent to the stranded vehicle, and the passengers change cars in mid-air, and are carried to their destination. Even should this be impossible, the passengers are provided with means of getting to *terra firma*. The floor of the car is fitted with a trap-door, through which can be lowered a collapsible bag, having a solid bottom, and carried by a rope. The passengers, one by one, are lowered through

the air in this receptacle, the speed of lowering being controlled by a brake, so that the ground may be reached safely and without a jar. The running arrangements are also of an elaborate character. The two cars start from each station simultaneously, the signals being transmitted from one point to the other acoustically and optically, and must be confirmed before the driving-gear is started. In addition, a telephone-line is stretched beside the track, whereby the driver can communicate with either terminus from any point on the track. The journey occupies about thirteen minutes. This railway introduces a cheaper means of ascending rugged mountains than the rack-railway laid upon the ground. The first aerial railway of this character was built up the Wetterhorn two or three years ago, and its successful operation was responsible for the application of the idea to the Austrian Tyrol.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

PEACE!

THEY dream of peace, but you cannot seal
The dark-red fountains of greed and hate;
They talk of love, while the cold, hard steel
Is leaping now from the scabbard of fate.

Let the dreamers dream, as the days go by,
Of a peace which the past has never known;
There's a lurid light in the eastern sky,
And an armed suspense in the northern zone.

They are casting cannon in olden lands,
And the shipyard hammers are never at rest;
The olive-branch fades in their grimy hands,
The spirit of fear pervades the west.

A low voice calls from over the deep,
And the warning echoes from shore to shore:
'Let the foolish virgins their vigils keep,
For the enemy lurks by the open door.'

Awaken! The sands in the hour-glass run;
They are coaling gray ships in an eastern bay,
And the deafening boom of a Dreadnought gun
May usher the dawn of a ghastly day.

NEVILLE BOSWORTH.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible. ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

AT THE QUINTA PALAFOX.

By MARIAN BOWER, Author of *The Greenhorn*, &c.

CHAPTER I.

'CHILD, look before you,' said Doña Elena Palafox de Cavallos—a name abbreviated, after the fashion of Portugal, into Doña Elena—her worn, old voice vibrating with resentment, with hate, with all that vindictiveness (a quality virtually without limit) of which the Spanish woman, and her sister the Portuguese, are capable. 'You are a Palafox, and your father's family have never known how to bend the knee to an enemy; and when you have looked and marked, remember, and as often as you remember nurse your vengeance against these detestable Frenchmen, their upstart Emperor, and their nation, to the last day of your life.'

The girl, who had just joined her grandmother, obediently followed the gaze of the old woman, whose eyes—glittering, hard, more like a couple of black beads than human organs—were fastened, not on the old town of Coimbra lying in the hollow below; not on the great, broad river which separated the city from the historic house and garden inhabited, in days long gone by, by that Agnes de Castro whom a king loved as women rarely have been loved; not on the expanse beyond the villa of the most fertile plain in Portugal, but, nearer at hand, on a line of blue-coated men who were emptying the grain-stores, the oil-vats, and the wine-cellars of the Quinta Palafox for the benefit of the French troops, under Marshal Masséna, marching down the country to oppose Wellesley—later Duke of Wellington—and his modest forces.

The old woman stood, while the sun slanted down behind the river, the breeze came murmuring up the valley, and the scent of the countless flowers which beautify Portugal, its fields and its woods, came softly to her. But Doña Elena was not thinking of the hour or of the beauty of it, as she folded her thin, white hands on the knob of her ebony stick, and drew her mantilla of heavy black lace farther over her white hair.

'Those, child,' she went on again, when the storm in her heart forced a vent in speech, 'are Frenchmen, despoiling us as their Corsican adventurer has despoiled our king. Remember that, and hate every Frenchman without exception as long as you live.'

No. 114.—Vol. III.

Then, without waiting for the reply of her granddaughter—Doña Elena had given her command, and that, in her opinion, was all there was to be said on the matter—the old woman faced about. She began to go slowly along a rough track which led up the hill to the Quinta de Palafox, a massive building of stone, surrounded by a high encircling wall, which in the days of the fair Agnes had sheltered her royal lover, and which had developed into one of those country-houses—half a pleasure-dwelling, half a strong place—abounding in the Peninsula in the early days of the last century, isolated examples of which can still be found.

But when the old woman, who was little, spare, and thin almost to emaciation, came to what in bygone days had served as the postern-gate in the wall of the Quinta, she turned aside, and, with a scowling glance at the French sentry who paced to and fro before it, went along again still farther up the hill, up the famous hill of Busaco, to an outhouse which backed right on to the precipitous ascent.

This poor building, almost hidden among the camellia-trees and the mimosa-bushes which grew so thick on the slopes—in peaceful times seemingly but an outhouse for implements which were rarely required—was all that remained to Doña Elena. The rest of the Quinta had been taken possession of by the invaders, her horses were requisitioned to drag guns, her grain and her wine commandeered to feed the troops, her garden, with the orange-trees and the myrtle-trees overhanging for shade, was invaded by rough men, her rooms used to shelter an outpost.

The old woman shut the unplanned door of the one refuge left to her. Her granddaughter began the very simple arrangements for the evening meal. The girl was quite young, she was very tall for her race, and moved with a certain swaying grace; her eyes were as dark as her grandmother's, but there was a depth in them that Doña Elena's had probably always lacked; her complexion, of a peculiar ripe whiteness like the cream of camellia-flowers, contrasted with the cherry-red of her lips, and completed her almost startling beauty.

As she placed the dish of olives on the rickety

FEBRUARY 1, 1913.

[All Rights Reserved.]

table, the girl saw what evidently had a significance for her, though it was no more than an imprint of wet mud on the earthen floor.

'Luigi is here!' she whispered; and she turned towards the improvised bed as though she expected to see her brother on it.

'Luigi has been here,' Doña Elena corrected.

'And he has learned news?' breathed Joaquina.

Doña Elena considered a moment before she replied. 'Yes,' she admitted; 'your brother, child, who does not mind what risks he runs for his country, has learned'—

'By the secret way?' put in Joaquina.

With a gesture Doña Elena silenced the girl's impulsive remark. 'He has learned,' she went on, 'that the French will try to storm the hill of Busaco before the week is out. May they fail, these invaders; may they perish miserably, every man of them; and may the tortures of purgatory follow them!' As the old woman ended with this pious wish her thin fingers dotted the sign of the Cross on the breast of her black gown.

Joaquina did not echo the wish. She hated the French as a nation, as it seemed to her she was in duty bound; but the feeling hardly extended to every man belonging to it. She had even learned to distinguish between the various units of the enemy occupying the Quinta. There had been one occasion, perhaps the first time in her life that Joaquina had walked out unattended, when she had been sent by Doña Elena ostensibly to draw water at one of the wells—the Quinta having been built to stand a siege, the wells were a feature of its arrangements—in reality to be on guard while Luigi and his grandmother completed a certain plan. The girl, to carry out her part, put her earthen vessel under the stone spout, and began to turn the stiff iron wheel. A trickle of water was flowing into the receptacle, which in shape had remained unchanged since Moorish times, when a French officer, accompanied by his orderly, passed.

Evidently the officer's first impulse was to set the man to turn the wheel; but after he had looked once at Joaquina he approached her. 'Allow me, mademoiselle,' he said.

Joaquina drew back.

The French officer filled the jar. 'Now, may I not carry it for you?' he asked.

'No,' blurted out the girl; 'indeed no, *señhor*. My grandmother would be angry.'

The big man with the deep-blue eyes of the Norman, a large blonde moustache, and a ripple in his hair, smiled. 'The Doña Elena hates us, I know,' he said. 'And you, *señorita*?'

The girl let her eyes drop.

'And you, *señorita*?' the Frenchman persisted.

Joaquina looked up. She met the gaze fixed on her. The colour suddenly warmed her ivory skin. '*Madre di Dios*,' she murmured, 'I must go at once. Indeed, *señhor*, I must go at once.'

And the Frenchman knew enough of women to realise that he had been answered.

Doña Elena had hardly completed her frugal meal of olives and bread when a peremptory rap sounded on the door.

Joaquina half-rose; but with a gesture her grandmother made her draw back, and went herself to open the door.

'Am I not to have even this outhouse in peace?' she asked indignantly, as she saw a group of French soldiers standing without.

The sergeant in command mumbled that he was but obeying orders.

'And your orders are?' questioned the old woman.

'To conduct the Doña Elena before the officer in command in the Quinta,' the sergeant answered again, and he said the words in an unwilling way, as if he were afraid that the little, fierce old woman confronting him was a witch and might put a curse on him as he spoke.

But Doña Elena neither argued nor expostulated. She knew exactly when she might defy and when she must submit. She pulled her lace mantilla right down over her brow, took her stick, which she always carried, not because she needed it to walk with, but because it served her as a symbol of authority—and Doña Elena's authority during all the many years of her widowhood had been a very real thing—and stepped over the threshold.

'Pardon,' stuttered the French sergeant, as he saw her thin hand put up to close the door; 'but the Doña Joaquina must come as well. Those are my orders.'

The old woman drew herself up. She raised her stick; it quivered poised in the air. For a fraction of time it seemed as if she were about to strike the man who was audacious enough to suggest that Joaquina, in her youth and her beauty, should be paraded before French eyes; and then, with her thin lips drawn back from her yellow teeth, Doña Elena called to her grandchild. 'Come,' she said, 'since we have no choice but to obey; but remember this as well.'

She put out her hand and grasped the girl's wrist; and, the old woman holding on tight, the two descended side by side, passed through the postern-gate, then into a low, vaulted passage, which finished in a paved courtyard, with a well in the centre protected by a headpiece of beautifully carved stone.

As Doña Elena felt her skirt touch this exquisite memorial of King Pedro's time an expression flitted across her face which, had any one more observant than the superstitious sergeant been there to see, would certainly have provided food for reflection.

Through the courtyard the group passed by more passages and up a low flight of stairs to the more modern portion of the Quinta, until at length they reached the great *salon*. The windows of this long room looked on to a

veranda held up with stone pillars, each pillar wreathed with a fragrant climber or with the remains of one; more steps led down into the garden; and that garden in its turn was bounded by a high wall completely encrusted on its inner side with the blue-and-white tiles peculiar to the country, representing scenes of seventeenth-century Portuguese history.

As Doña Elena entered she was bidden to place herself with her back to the veranda, that she might face the French officer who was sitting at a table with a map spread out before him.

It was several minutes before this man looked up.

As the old woman waited she examined the enemy before her, and a less prejudiced person, equally with her, would have found nothing pleasing in the short, stout figure, with a heavily bearded face set on a thick neck. When the man raised his head there was little that was pleasing in his expression, with the sinister scowl and the cross-eyes. Indeed, Pierre Toffin, who had swaggered as a Patriot in the days when patriotism was synonymous with all that was worst in human nature, was one of the unpleasant survivals of that time. His kind were mostly eliminated from Napoleon's army long before the end came; but as often as they were to be found in any command every unnecessary brutality was added to the horrors of war.

'Widow Palafox'—began this man.

'I am generally addressed as Doña Elena,' returned the woman who was at this barbarian's mercy.

'Widow Palafox,' began Toffin again, 'your hostility to the French, whom you ought to greet as your saviours, is notorious. You have gone too far. So long as the Colonel Rubenapré was in command you went on unchecked. Now that I am the senior officer here, I am determined to put a stop to your seditious ways.'

Doña Elena answered merely with a smile, and she contrived to make that movement of her lips so provoking that the angry man, looking at her, rose with so abrupt a movement that his chair overturned and went down on the polished floor with a resounding noise.

'Woman,' he cried out, 'do you dare to defy me! *Nom de nom*, can I not have you shot where you stand?'

Again Doña Elena answered first with a look. 'You forget, Frenchman,' she replied exactly when it pleased her to explain herself in speech, and not before, 'I am seventy. It is not so very hard to leave this life when one has lived the allotted threescore years and ten.'

But, as it happened, no remark could have been more unfortunate. It drew attention to Joaquina, who was seventeen, not seventy.

'Bow!' remarked Toffin grimly. 'You tell me, woman, that you are too old to care whether you live or die. I will not question you further for the moment; your turn shall come again later.'

But you shall be taken on to the veranda, where you can see and hear. You are not to speak. I don't want my time taken up with querulous old women. If you utter a word you shall be gagged. Your granddaughter will remain before me. I will examine her. It may be she will have more interest in answering my questions, since it is possible that she will have longer to live and more to enjoy.'

'Man,' cried out Doña Elena, roused at length, 'my granddaughter shall not remain in this room with you by herself.'

The Frenchman made no reply. This time he had the upper hand, and he was enjoying the sensation. 'Take the old woman out,' he commanded.

'I will not leave my granddaughter, a young girl,' Doña Elena declared.

The stumpy man looked past her indignant face. 'Take the woman out,' he said again to the sergeant. And this time he added, 'Prevent her talking any more.'

It was but the work of a few moments to remove Doña Elena. It was beneath her to struggle.

Then Joaquina stood there, with her back to the veranda, the room emptied of all the French but Captain Toffin. The girl drew herself up. The proudest blood in the Peninsula flowed in her veins, and in the moments of supreme stress good breeding has a habit of telling. Besides, she had that power of a sudden ripening which belongs to all women in a measure, and to the Southern woman in a superlative degree. She had entered the room but the mere shadow of Doña Elena; she stood in it alone, undismayed, filled with courage.

Pierre Toffin examined her slowly. He knew that two old blazing eyes were following his insolent gaze. He was beginning to realise all the insult that his mere proximity to her granddaughter meant to Doña Elena, who had inherited those almost Oriental notions of a woman's seclusion which died so hard in the Peninsula. Then he spoke. 'Your brothers are fighting with the rebels, girl?' he began.

'They fight for Portugal, señor,' answered Joaquina.

'You are a family of malcontents,' he went on.

This time he received no reply.

'You have been permitted to remain too near to the Quinta,' Toffin resumed. 'You have not even been questioned. You may be spies, for all I know. I am tired of the leniency shown to you. You do not merit it. You must declare yourselves for France—you, girl, and your grandmother. I begin with you. Cry "*Vive l'Empereur Napoleon!*"'

The harsh voice ceased. The figure on the veranda, with a scarf bound across her mouth, leaned forward. Joaquina waited a perceptible space. She was alone. She was at the mercy of the man who leaned over to her, who glared at her.

Then the soft voice answered, 'I will not cry "*Vive l'Empereur Napoleon!*"'

The figure on the veranda relaxed. The Frenchman struck his fist on the table.

'Girl,' thundered Pierre Toffin, 'shout "*Vive l'Empereur!*"'

The great dark eyes looked steadily back into the man's infuriated ones. 'Pardon me, señor,' Joaquina answered, 'I will not cry "*Vive l'Empereur!*"'

'Then,' began Toffin—'then'—he paused, and waited to think of something especially cruel—'then'—he repeated; and as he said the word for the third time the door opened.

Toffin looked up with a scowl. He always maintained that, no matter how the times changed, his opinions were Republican—which really meant that he considered himself on all occasions exempt from the obligations of ordinary courtesy; but now, in addition to his distaste for common civility, there was a personal dislike to the man who entered.

Louis de Rubeaupré, colonel, and one of Masséna's favourite staff-officers, belonged to one of the oldest families in France; he was, moreover, senior to Captain Toffin.

The new-comer took one look at the girl, and as his eyes fell on the beautiful face he started. Involuntarily Joaquina smiled back at him—for he was the Frenchman who had helped her to fill her pitcher at the well; involuntarily, and before she had time to recollect that she was asking a favour of an enemy, a word of supplication slipped out of her red lips.

'Monsieur,' she besought, 'help me!' and she little dreamed of the quiver of rage that shot through Doña Elena's spare frame as she heard the cry for mercy.

Colonel de Rubeaupré looked at Toffin. 'What does this mean?' he demanded.

In a very surly tone the Patriot explained.

'You exceeded your instructions,' his colonel retorted. 'You were to take over the command of the Quinta while I conferred with the headquarters staff; you were not bidden to intimidate an old lady and'—He stopped; his blue eyes were on Joaquina again. In a flash this Frenchman knew why he had hesitated to apply the term 'young girl,' which trembled on his lips, to Doña Elena's granddaughter. The old woman on the veranda saw his look, and she never forgot it. Joaquina saw it, and she glanced shyly back.

Then Louis de Rubeaupré stepped up to her. 'You are free, mademoiselle,' he said. 'I will take care that you are not inconvenienced again.'

'And my grandmother?' asked Joaquina.

Colonel de Rubeaupré looked at the figure held by the two soldiers. 'Unhand that lady,' he said quickly. The next moment he saw the scarf round Doña Elena's mouth. 'Remove the bandage,' he commanded even more sternly.

Doña Elena stood free.

Louis de Rubeaupré walked through the window to her. 'Madame,' he said courteously, 'I trust that you will forget what has passed.'

The old woman, with her eyes glittering and her lips compressed, inclined her proud head stiffly. She knew that she had to thank this handsome man with the blue eyes and the gay laugh for her life, for her granddaughter's life, for more; and yet she hated him almost more than she hated that other Frenchman who had been so brutal; for had not this one smiled on Joaquina, and, what was worse, had not Joaquina smiled back on him?

'With your permission, monsieur,' she said haughtily, 'I and my granddaughter will retire.'

Louis de Rubeaupré looked at the girl again. The pulse of life beat very fast in the days when Napoleon made a man a king one day and uncrowned him the next. Louis de Rubeaupré knew in brief space that which in less strenuous times it might have taken him weeks to learn. He knew that he had never looked on a woman's face which touched him as Joaquina's did. He knew that if he had his way the matter would not end with this one interview. He looked at Joaquina. What had she felt, when he felt so much?

Joaquina lifted her great eyes. Just for one happy moment the division of race and the division of war were forgotten, and the Frenchman and the Portuguese girl only remembered that they were man and woman to love and to be loved.

Then a long sigh escaped De Rubeaupré. The girl's white cheek flushed scarlet.

'Mademoiselle!' cried Louis. But Doña Elena cut him short. 'Monsieur,' she interposed in a voice as cold as ice, 'if you will tell your men to allow us to pass, my granddaughter and I prefer to retire at once.'

(Continued in following section of this part.)

AUTOMOBILISM TO-DAY.

By the Right Hon. Sir J. H. A. MACDONALD, LL.D., K.C.B.

THE mechanical road-vehicle has already a literature of its own. There is probably no subject of public interest which has so many journals devoted to it as that of automobilism. Although it is but ten or twelve years since the

time when the tide of motorism began to flow, there are at least ten journals devoted entirely to the one subject—a larger number of papers than has been called forth by any other department of locomotion—and another has been brought out

within the last few weeks. In addition to this, many newspapers and weekly journals set apart space for news and comment on automobile topics, and that not by paragraphs, but by columns and even by pages. Already important books of scientific information, and of more popular character—books of history and of travel, &c.—have passed through the press upon motoring subjects.

All this is not matter for surprise when it is realised that the progress of the new mode of locomotion has been phenomenal—a progress so amazing that no parallel can be found to it in the history of any invention of the past; and when it is considered that, unlike most inventions which only touch particular departments of life, that which is being spoken of is one which has to do with the road, a thing of absolute universality throughout the civilised world. The use of the road is indispensable to the whole community everywhere. From the wealthy who use it for pleasure, down through all the phases of trade, to the poor consumer who, though not personally using the road by vehicle, except on rare occasions, is yet dependent upon it to bring supplies of necessities to his door—down through all this range there is no one who has not an interest in having road transit made easy, convenient, and cheap. Thus the mode in which locomotion shall be carried on upon the road presents a question of universal interest. But just in proportion as it affects the whole community, so would it naturally be supposed that any change upon existing systems could only make its way by slow degrees, a change being not possible without sweeping aside what has been looked upon for many generations as normal and therefore satisfactory. The ordinary citizen, and especially the citizen of these islands in which we live, has no natural tendency to look sympathetically on what tends to take him out of his accustomed groove; and though some other nations, particularly our American cousins, are more easily moved to favour the new, nevertheless a change so radical as the supersession of animal traction on street and road might be expected to appear to most men, of whatever nationality, as the dream of hare-brained enthusiasts.

Yet all must admit that the once inconceivable is a thing now in sight. A revolution has been accomplished in a short term of years such as has no parallel in the past. There is no country which is classed as civilised in which the power-vehicle has not become a matter of course upon the road; there are few countries in which it has not in great measure ousted horse-traction; and there is no country in which it is not advancing with rapidity towards practical overwhelming of the past order of things. No one can spend a day in London, or Paris, or any great city, either at home or abroad, no one can observe what is happening upon the country roads, without having to admit—willingly or

unwillingly—that the signs of the times point to the certain elimination of horse-haulage except for very limited purposes. As regards the passenger vehicle, the contest may be said to be practically concluded; and in the case of the commercial vehicle the signs are unmistakable that the process of change is taking place with ever-accelerating speed. It is no uncommon thing in the busy streets of London to see a stream of forty or even fifty passenger-carrying power-vehicles pass by before a single horse-drawn vehicle appears; and of mechanical commercial vehicles the proportion already is as great as 20 to 25 per cent. The manufacturer, the merchant, and the tradesman have been led, or it may be driven, to the conclusion that power-traction is a necessity if successful competition is to be maintained; and are finding that the change is valuable not only for its efficiency, but also because of its comparative cheapness. There is no more uncontrovertible testimony on both points than that which may be deduced from the policy adopted by H.M. Post-Office. A department which is under the thumb of the Treasury cannot obtain sanction for any change in its mode of service unless it can be demonstrated, in the words of a well-known official condition-formula, 'that the change will not involve any additional charge to the Public Service.' And, on the other hand, there is no Government department which will more speedily come under the public lash than the Post-Office if the Postmaster-General makes any alteration in his mode of carrying and distributing postal matter which gives a less satisfactory service than has been formerly enjoyed. It is, therefore, a striking illustration of the efficiency of a public motor-post, and of its cheapness as a mode of transit, that the Postmaster-General has, with the sanction of the Treasury, established a number of motor-postal services, and is adding to their number from day to day. As regards efficiency, there is praise from the public, and no complaint; and as regards economy, while but a fraction of the services have been altered from rail or horse to motor, the saving already made is no less a sum than one hundred and thirty thousand pounds per annum. This is the best advertisement that the power-vehicle for commercial purposes can have, and it is not surprising that the builders of business vehicles have their books so crowded with orders that nine months must elapse before any new contract can be followed by delivery.

But it is not only on the road that the horse is being ousted by the motor. Rapid progress is being made in the adaptation of mechanical power to agricultural work. Ploughing, harrowing, sowing, reaping, husbanding, and conveying to market can all be accomplished now by power-traction, and that more speedily and more efficiently than was the case formerly. And the same machine which gives the power for all these

services can perform the work of driving the threshing-machine, the chaff-cutter, the large churn, and do all other work requiring power. This is a change which has a secondary effect of great importance, as the considerable proportion of farm-land which at present provides food to enable the horses on the farm to live and to do their work can now be devoted to food-production for the citizens. This is a matter which is little thought of, and was little thought of in the past, when mechanical traction on roads was crushed out by the selfish opposition of the railway, the squire, and the farmer in 1833; but when it comes to be realised, as it is being realised now, it will have a very strong influence upon the views of the community, to whom it is well known that the United Kingdom cannot provide itself with sufficient food-stuffs to sustain its vast population for any length of time. Any change in agricultural management which would alter this state of matters, even in moderate degree, might be of great value to the country if national emergency should arise.

Contrast what has been recorded above of motor progress in all departments with the state of things on that day, in November 1896, which to motorists has the name of Emancipation Day, when first it was permissible to place a motor-vehicle on the road without having three men in attendance, one of whom was obliged to carry a red flag forty yards in front, and speed was limited to three miles an hour. On Emancipation Day the road to Brighton was strewn with broken-down motor-cars, and those ten or a dozen that struggled through to the end accomplished their fifty miles in periods varying from five to ten hours. Things looked by no means promising, and many were the shrugs of shoulders and the jeerings of those who looked upon the whole proceeding as a dramatic demonstration of the folly of semi-mad enthusiasts engaged in a hopeless enterprise. The pioneers have had their revenge. The Brighton Road to-day carries its hundreds of motor-cars in twenty-four hours, and there will not be a case of breakdown or even of lengthy detention in a period of months. Never again will it be a horse-traffic road. The power-vehicle—the despised of 1896—had by 1910 taken possession once and for all.

The automobile has its place, as already mentioned, in the journalistic literature of the day, and that no mean place. Short as has been its career, it has already its treatises and its historical works. Numerous books relating to the technical details of the power-vehicle, treated both historically and scientifically, have passed through the press, notably those by Mr Worby Beaumont as a technical exponent, and by Mr Charles Jarrott as a practical motorist and business man. Books of motor-travel have been written, and numerous guides and handbooks devoted to motor-travelling have been issued.

Recently two new publications have appeared,

one journalistic, in the form of a new weekly paper called the *Cyclecar*, issued by the Temple Press, which already owns two successful journals, the *Motor* and the *Commercial Motor*. The other is a handsome work, *Motor-Cars and their Story*, by Mr F. A. Talbot. The former is devoted to a new development, the small car, suited to persons of moderate means. Till lately motor-car builders were so busily engaged in supplying the rich with large, powerful, and luxurious vehicles that little attention was given to the less wealthy public. For a time the power-vehicle was not associated in the public mind with the general community, but only with the well-to-do as users of cars and with the youthful as riders of motor-cycles. It took some years before it came to be realised that general usefulness was to be served by mechanical carriages, to the practical supersession of not only the landau and the brougham, but also of the gig, the dog-cart, and the governess-tub, &c. But the time has now come when not one but two crowded exhibitions have been held successfully at Olympia within two weeks of one another—the usual motor-carriage exhibition, and for the first time a cycle-car exhibition of light, handy vehicles within the reach of persons of moderate means, enabling them also to enjoy the sport and obtain the practical benefit of motor-traction. That a new journal specially devoted to the cycle-car should be successfully launched shows how motor-traction is covering the field of road locomotion, so that very soon its predominance will be manifest in all departments, as it is now in that of the users of carriages and the riders in motor cars and omnibuses. The Temple Press has been for some years publishing *The Commercial Motor*, and is now able in that journal to record the astounding success of the motor-omnibus, which less than six years ago had almost the stamp of failure upon it, but whose record since then is nothing short of wonderful. While in London the drawings of the London County Council tramways have decreased greatly during the year 1912, the drawings of the London General Omnibus Company, using power-traction only, have had a record increase during the same period. A few years ago it was recorded that Mr Llewellyn Fell, the president of the Society of Tramway Engineers, declared in a public speech that in twenty years' time no such thing as a motor-omnibus would be visible outside the walls of a museum! Thousands are now running, and earning ever-increasing profits; and thousands more have been ordered and are being built.

The other work to which reference has been made—Mr Talbot's *Motor-Cars and their Story*—testifies by its bulk to the greatness of the subject. Its three hundred and fifty pages present a mass of information; but it is free from all redundancy. Every page justifies itself by

its contents. Nothing seems to be stated without good reason, and what is stated is stated well. The opening words of the work, in the preface, sum up what has been urged above :

'The birth, phenomenal growth, and amazing development of the petrol-motor in its relation to the propulsion of vehicles constitute one of the most fascinating romances of to-day. Although the automobile, in one or other of its various forms, is familiar to all, yet very few people have any idea of the universal character of its conquest, or realise how completely it has revolutionised our complex social and industrial life.'

It must be admitted that Mr Talbot has been highly successful in unfolding the story in his book, which is historical, descriptive, and eminently readable. It cannot have been written without immense study, as it ranges over every department of automobilism, and shows equal knowledge of the crude productions of the pioneer days and of the finished and efficient vehicles which are now to be purchased.

The book has the great merit that it avoids a style of mere technical description, while at the same time the author gives very clear information, enabling the unscientific reader to form a useful idea of the different forms in which the machines are turned out by various makers. The book is also worthy of praise in that it treats fully of all the different uses to which, since the explosion-engine demonstrated its suitability for locomotion, it has been applied with success. It would be impossible here to go over all of them. Suffice it to say that from the luxurious limousine, down through the modest four-seater, the runabout for two, and the motor-cycle with or without a side seat, all are fully noticed. All that has been done in adaptation of the motor to war purposes—wagons, gun-carriages, searchlights, ambulances, &c.—is fully described. An interesting chapter is devoted to fire-brigade appliances, in which the explosion-engine is proving itself highly efficient. The adaptations of the motor to farming operations—ploughing, sowing, reaping, and all the accompanying operations—are fully gone into. Road trains and tractors of all kinds are noticed. The public service vehicle, whether for passengers or for goods, has its full chapter.

There is one feature of the work which calls for the very highest praise. It is profusely illustrated, and the illustrations are most judiciously chosen, and produced in an exceptionally good manner. They are admirable in every respect.

In addition to the descriptions of the vehicles, Mr Talbot gives his readers racy accounts of the early struggles of the motorist, and graphic narratives of the strenuous journeys that have been made in recent years to test the efficiency of the modern vehicle, out of which it came triumphant. The ordinary reader will find much that is of general interest, and not a page that is dull.

Great as has been the demonstration of the utility of the modern vehicle during the short period that has passed since the explosion-engine came into practical use, it is impossible to doubt that the progress will be still greater within a few years more. The weaknesses both of system and of construction have been practically overcome. For whatever purpose it is put to fulfil, the power-vehicle is showing itself to be practical, speedy, convenient, and economical. Every day people who vowed they would never have anything to do with it are sending in their belated orders, and chafing at the delay they have to submit to in obtaining delivery. Other equally strenuous objectors are now to be seen riding gaily in the comfortable seats of the taxi-cab. Every day the feats that were looked upon as well-nigh incredible are being excelled. The things declared impossible are matters of everyday occurrence. The words 'It can't be done,' which even scientific men used so frequently in the past, throwing cold water on the enthusiast, do not now make themselves heard so often. The writer can recall the answer of one of the greatest engineers of the day when asked, 'Would you mind telling me whether, if any one had said to you thirty years ago that reciprocating engines could be run safely and usefully at two thousand five hundred revolutions a minute, you would have believed it?' His reply was, 'I would not have believed it twenty years ago.' Yet to-day even two thousand five hundred revolutions are not the limit. This has been demonstrated by the explosion-engine. The demonstration has proved that materials can be so skilfully prepared that they will bear strains such as no engineer-designer of the last century would have dared to risk. The requirements of the motor-car builder have stimulated the steel manufacturer, so that things inconceivable to a past generation are now things of every day. Then gear-wheels would strip their teeth constantly; now they will run for years without risk of failure. Light driving-shafts have superseded chain-drive with complete success. The application of the electric spark to fire the explosive mixture has become so perfect that a breakdown is not thought of as likely, and where formerly two sets of sparking apparatus were taken in a car, it is found safe to trust to one. These are a few illustrations of a progress in efficiency which approaches very near to practical perfection.

All that is now needed to make locomotion by road what it should be, both for pleasure and for commerce, is that the road itself should have as efficient scientific skill applied to it as has been applied to the road-vehicle. This is being done, although it is necessarily a work requiring time. Still, the prospect is before us that good vehicles running on good roads will be a marked feature of the twentieth century, by which the whole community will make great gain.

THE SHIP OF SHADOWS.

By JOHN FOSTER, Author of *The Bernardine*, *The Forgotten Rock*, &c.

CHAPTER XIV.—A THREESOME.

'THE whole affair burst on us with the suddenness of a bombshell. There stood Lowden or Gregory, or whoever he was, commander of the situation and the ship; and travelling slowly, guardedly, from Evan to myself and back again was the wicked, unblinking eye of the revolver. Plain murder, if we thwarted him, was written in his cool, wary poise. Crouching slightly forward, except for a swift glance aloft or at the compass, he never took his eyes off us for an instant.

'I was afraid, I own, yet determined to sell my life dearly. To "rush" him meant suicide for us both. No plan that did not spell futility could be thought of. We had no firearms, and could not have reached them even if we owned any. There we stood, as impotent as a couple of snared rabbits. But for the captain's cry haunting us, and the blood-stained deck plain to see, I might have been awakening from a dreadful dream, so swift had come the black turn in our fortunes.

'The sound of his voice came as a positive relief to our wire-drawn nerves—not in his words alone, but in the manner of them. There was a new quality in his speech and bearing. A strange thing; but I tell you that from the minute he took the tiller he was a changed man. No more moody staring into distances; no more talking to himself. Instead of a silent, brooding foremast-hand, he was the master, cool and alert, clarified and sustained, authority fitting him like a glove. Not the first men or ship he had commanded, it was easy to see.

"Come aft!" The words rang clear. "I've no quarrel with you; nor had I any with the mate until he made one. I give you my word that you are safe; that is"—this with deadly politeness—"if you will kindly understand that I am sailing the ship now. If not"—he shook the revolver for all the world like a half-playful, warning forefinger at us—"I may be under the necessity of sailing her alone."

'Nothing could have been clearer than his meaning, nothing more callous or more convincing than his telling us that we were dead men if we failed him. At a second order to come aft I followed Evan a step or two forward; I own that I was in a cold sweat, but he put us both out of immediate suspense.

"That's right," he said almost pleasantly. "Now, I sail this ship until four bells on the second day after this. After that I propose to hand her over to you, and shall not interfere further with your seamanship, nor, may I add, with your course. Meanwhile—*Ready about!*"

'We stood stock-still in surprise at the order, until Evan grabbed my arm and ran me forward. We stood by the jib-sheets, Lowden put the tiller

down, *The Ayrshire Rose* came round smartly, and in a trice she was put about and we were sailing back again on the course we had come.

'At his order, at nightfall, Evan took the tiller. Lowden paced the deck watchfully, sailing the schooner most capably, and with his assumption of leadership a strange new light was in his eyes, almost of hope, as if every knot she sailed brought him nearer some goal.

"Keep her full an' by," he shouted to Evan.

"Full an' by, sir," and the stereotyped answer marked the strange sudden relationship of skipper and crew between us. Murderer, desperado, monomaniac, he knew the business of the sea, and, I will say, sailed the ship like a gentleman. His coolness and resource dominated us. And, let me tell you, there is a tremendous magnetism in the muzzle of a revolver. I never saw such smart discipline. It was "Yes, sir!" and "Ay, ay, sir!" and everything in order as if we had known no other officer on board. Further, there was nothing of a roaring second-mate about him; every order shorn of its usual brusqueness; an owner sailing his yacht for a pleasure-cruise couldn't have been more considerate, but for two things. One was the shining little weapon continually in his hand. The other—want of sleep—did not trouble us until later. He owned a frame of steel, as we knew, and apparently had no thought of sleep either for himself or for us. As long as he did without sleep, so perforce must we. There was a touch of grim comedy about his explanation, given politely, to the effect that the uncertainty of the weather left him no alternative other than to keep us awake; but that he would include himself in the discomfort, and would not turn in.

'There was nothing for it but to stand by our work, and tire him out if we could. But under his silken speech and inscrutable lines he was strung to a resolve. He never closed an eye. He took the tiller from Evan, who brought him coffee and food; thanked him, but tasted none of it; and the dawn saw him again at the tiller. Evan and I were both done-up through want of sleep, for all through the night it had been first one order, then another, keeping us on the move, so that between these, our unstrung nerves, and the dreadful phantasmagoria of the evening before, sleep had been impossible.

'The wind had strengthened, coming in gusts, slicing the tops of the waves into little puffs of smoke that whirled over us, wetting the deck and stinging our faces. All day long the same grim routine was followed, Evan occasionally at the tiller, both he and I listless and half-asleep, lead on our eyes and feet, obeying orders mechanic-

ally. As for Lowden, his eye agleam and his voice resonant, the man was seemingly as fit as if he had slept through his watch, an incarnation of capacity and resolve. Napoleon's soldiers after Moscow, they say, marched in their sleep, and I believe it, for the orders from the man of steel and whipcord soon began to sound as unreal and distant as a voice in a dream.

'At length, towards night, "I'm nearly done," whispered Evan to me. "I'll risk him. As well be shot as go crazy;" and he dragged himself aft.

"Come no farther than where you stand without orders," called Lowden, eying him steadily, and up came his revolver.

'Evan needed no second bidding. "Beggin' yer pardon, sir," said he, as he halted, "we want to help to sail this ship; but want o' sleep."

"I'm sorry, my man. But you've got to hold out until four bells to-morrow. And then—then you can sleep round the clock."

'Evan stood still for a moment.

"I promise," said Lowden, his thin lips tightening; and Evan came forward again.

'To keep awake until four bells next day seemed impossible, and I don't believe till this day that Evan and I did. I fell into a half-blind stupor, staggering about my job automatically. There's a species of mental "second wind" after a certain stage of anxiety and want of sleep that keeps one up for a time; but I must have slept more or less on my feet as the day wore on. Time and again both of us reeled and fell. Then a voice from aft would reach us, mocking in its steadiness, and with an effort I would struggle to my feet, to pull here or loose there, or take a sounding, or carry out whatever device to keep us awake that occurred to the devil at the helm.

'The cruel hours crawled along. The wind began to bluster fitfully, adding almost unbearably to the strain on my nerves. I began to feel light-headed. Tunes ran in my head. I saw imaginary ships, gaunt and towering, their crews pointing and grinning at us, fantastically close, passing and repassing, or coming straight at our broadside, to vanish and leave me shuddering. Lowden at the tiller would grow to a monstrous shape of evil power, watching, watching, to dwindle again; faces, outstretched arms, rose from the waste and vanished; or the sails and spars would zigzag, change into blurred, edgeless things, to nothingness, to gray fog, until a shouted order rang from aft, and the Ship of Shadows leaped uncannily into life again, the wind moaning lamentably through the shrouds, and the sleepless man aft watching, watching.

'At length the time wore on, nearing the hour when he had promised us sleep. Afterwards I've often thought it curious—and Evan agreed with me—that neither of us doubted his promise. The sky was overcast, brooding and threatening. He had been very quiet for an hour or so. The ship was sailing easily, but there was a menace in the sky. Suddenly he began to sing, not

loudly, but the air reached me and I recognised it. It was the Lorelei, "*Ich weiss nicht was soll es bedeuten.*" Once or twice since then I have heard it, but under very different conditions, in concert-halls amid warmth and crowds, and each time the lights and faces have vanished, and I was back again with a shudder on the Ship of Shadows, and heard the man singing at the tiller under the darkening Atlantic sky.

'Evan was staring at him, and turned to me. "*Criosda leinn!*" he whispered. "It is *fey* that he is."

'The singing suddenly stopped, and Lowden called out an order to "snug" the ship. Wondering, we shortened her canvas. Then he gave the tiller to Evan, moved slowly to the companion, and struck the hour very deliberately.—Four bells.—I remembered suddenly that hour two days before. The ensign was still at half-mast. We were just about the place where poor Gerrand had given his wife to the merciless embrace of the sea.

'I was dully speculating why the ship was brought to. Evan had taken the tiller. Lowden, after striking four bells, walked close to the lee rail. Then, in a steady voice, he gave the naval formula, "I leave the ship," turned round, and gravely saluted us. I think that I knew what was coming; but before my thoughts ran into action he put one foot on the rail, called, "Coming, Madge," and at a bound cleared the rail and sprang overboard.

'When I came to myself Evan was bending over me. The want of sleep and the horrors of the last two days had brought me to breaking-point. I had collapsed on the spot.

"Come, laddie, we're all that's left." He helped me to rise, and we staggered aft like drunk men. Evan reached the tiller, and I dropped beside him like a log. The schooner was lurching wildly, a gale breaking overhead in a wild burst of rain.

'I was past caring for wind or weather, feeling like death. All I wanted was to be left alone, to shut my eyes and lie down for ever.

'It seemed days after, though it was only an hour, when I was roused by Evan shaking me. I sat up and looked round me with a shudder.

"I'm goin' to put her about again for Scotland. We can do it. She's a biddable ship. Another ten meenits an' we'll get some sleep. Rouse an' bitt, lad!" Evan kept calling.

'He held a stiff "Dogger Banker" (three parts rum, one of steaming hot coffee) to my chattering teeth, and watched me swallow the potent brew. Then he hoisted me to my feet. I felt about as cheap as ever I did; but with the courage of desperation I managed to stand by the tiller. He went forward and let go the sheet, and at his shout I gathered up the lees of my strength, contrived to put the tiller hard down, and the schooner swung round.

'Then he came aft, the picture of weariness, and looked at the barometer. "Heavens! I'm

goin' to let her risk it, for I'm done," said he. He lashed the tiller amidships, and lit the lights. The schooner bowled along, running free before the wind. We lay down literally where we stood, and were sound asleep in our drenched clothes in less seconds than it takes me to tell it. 'Come to think of it, had it been daylight,

passing ships might well have wondered at the sight; the schooner sailing unmanned like a ghost in the great waters; her ensign still at half-mast with its message of Tragedy and Death; the two mariners worn-out, in their deep sleep as inert as the dead.'

(Continued in following section of this part.)

THE ANNALS OF A FRONTIER TOWN.

By A. B. FORTUNE.

THOUGH the history of an American frontier town may not go very far back, the stirring events which often crowd its records more than compensate for any shortcoming in this respect. It is a story in which, unfortunately, battle, murder, and sudden death too often predominate. Of law, except lynch-law, there was practically none, might was right, and an insult could only be wiped out in blood.

These western towns came into existence in two ways. Some of them, beginning with a collection of adobe huts dumped down under the walls of a fort or mission station, or at a point having natural advantages, evolved themselves in course of time into those marvellous up-to-date cities which dot the western states; others were started right away with a full-fledged mayor and corporation, town-hall, and drinking-saloon, disclosing a confidence not always justified, for they existed in too many cases only so long as the neighbouring lode held out, and with its disappearance they too vanished; and nothing can well be more melancholy than the remains of a town of this description, with its buildings, many of them abandoned before completion, falling into decay, a tragic spectacle, the wrecking of a too exalted ambition.

It is to the former category that the city of San Antonio in Texas belongs, a history of which is before me. It is written more or less in guide-book form, but contains many extracts from the diaries and recollections of old-time settlers, and the narration of a few of the more striking events they contain may not be without interest to the readers of the *Journal*.

In 1715—at which time, and for about a century afterwards, Texas formed part of Mexico—the Spanish Government erected a fort on the western bank of the San Pedro River, followed shortly afterwards by the establishment of a mission station, where for many years the priests laboured among the Apache braves—not, however, it would seem, with great success, for the Redskin has never been very amenable to missionary zeal. Where they found persuasion to fail they appear not to have hesitated to try coercion, and it is not surprising to find one of the Fathers lamenting that 'the conversion of the Indians was a miracle of the Lord's mercy,' and that 'it was necessary first to transform them into men, and afterwards

to labour to make them Christians.' So, in fighting on the one hand and proselytising on the other, the years passed, while around the mission station a collection of adobe shacks gradually arose; and this was the beginning of the present-day city of San Antonio, the real history of which does not, however, start until after the arrival of the first American settlers.

When exactly this took place is not very apparent; but in 1800 a party of eleven Americans in irons was brought in after a fight with the Spaniards—rather an ominous prelude to years of much fighting and bloodshed. The turmoil soon became general. The Spaniards and Mexicans, when not fighting among themselves, were at war with the Indians; and now, with the arrival of the Americans, another and very potent element of discord was introduced. The last-named gradually asserted themselves, creating a situation analogous to that in the Transvaal before the Boer war, and with results very similar—the Anglo-Saxons dominating, though not conquering, the others; so that by 1821 San Antonio, with a population of five thousand, contained a good proportion of Americans.

Over the subsequent period, though doubtless replete with unrecorded incident, we must pass, until we come to 1836, a red-letter year in the history of Texas, for in it occurred the great fight at the Church of the Mission del Alamo, of which all Texans are justly proud, and which deserves more than passing reference. It was on 23rd February that the Mexican army of four thousand men, under General Santa Anna, appeared before San Antonio, and marched straight into the town, which at this time was garrisoned by about one hundred and fifty Americans under Colonels Travis and Bowie (to the latter of whom, by the way, the famous bowie-knife owes its name). These—who were later on joined by others, making one hundred and seventy in all—retired slowly before the enemy, and finally entrenched themselves within the courtyard of the Alamo, where, in the somewhat wild words of a local historian, 'straightway began that bloodiest, smokiest, and grimmest tragedy of this century.' And without doubt it was a great fight, for it was a fight to a finish, as with the odds against them every man knew that there could be but one ending to it. Seldom, perhaps, in history

has a more formidable body of men been collected together than those forming this small party of resolute, hard-bitten frontiersmen, every man a marksman, inured from infancy to all kinds of hardship, and cradled amidst wars and alarms. Santa Anna soon found that, notwithstanding his vast superiority in numbers, he had a big task on hand, and the lesson the Mexicans learned that day they have never forgotten.

On the details of the fight it is unnecessary to dwell. Driven from the courtyard, fighting desperately, the Texans, or as many of them as were left alive, took refuge in the chapel, where a strangely dramatic incident occurred. Colonel Travis, after a moving address to his men, drew a line on the floor with his sword, and asked all who were ready to die to cross it. Every man did so; those who from wounds could not were carried over. There was only one whose heart failed him, and he escaped and vanishes from history. The end, however, could not be long delayed; but the Mexicans only gained entrance to the chapel over the dead body of the last man, while round the Alamo five hundred and twenty Mexican dead lay piled, showing not only the desperate nature of the defence, but also that the attackers, whatever their other failings might be, did not lack courage. At Austin, the capital of Texas, there is a monument bearing the names of the heroes of the fight, and on the pediment the legend, 'Thermopylae had her messenger of defeat; the Alamo had none.'

For a time after this the people of San Antonio seem to have been left in comparative peace and to have led a more or less happy existence. We read of picnic-parties, dances, and other frivolities; but the presence of the Indians around them, and of desperadoes or 'bad men' in their midst, lends a somewhat lurid colouring to all their proceedings. No one could venture far outside the town except as one of a well-armed company. Indeed, mention is made of more than one riding-party being driven precipitately into safety; but in 1839 a party of eighteen, not so fortunate, were cut off and killed to a man.

Only once was there a fight with the Indians actually in the streets of the town, and it arose in this manner. On 19th March 1840 sixty-five Comanches came in for the purpose of ransoming prisoners, and proceeded to the court-house, where the terms were discussed. In the course of the discussion the Americans agreed to pay what was demanded; but, mindful of the duplicity and treachery of the Red Man, they decreed that they would keep some of the chiefs captive pending fulfilment. On the Indians hearing this the fat was in the fire, and they immediately raised their war-whoop, drew their bows and arrows, and commenced shooting all round, killing at once the sheriff, the judge, and some others; they then bolted into the street, where a running fight was engaged in, only a few escaping, leaving the streets strewn with their dead. While the fight was in

progress a duel of an unusual kind was witnessed by Mrs Maverick, one of the first American women to come to San Antonio. Mention of it is made because it attests—if such were necessary—the daring and resource of the Indian. Captain Lysander Wells, in the midst of the turmoil, was riding down the street on a gaily caparisoned Mexican horse, when an Indian rushed from one of the houses, and, leaping on behind, pinioned him round the arms and endeavoured to ride off with him. The two struggled for some time, swaying from side to side, until Wells, getting one arm free, drew his pistol from the holster and shot his adversary through the body, adding another victim to this unrehearsed drama.

The consternation this affair caused to the inhabitants can be easily imagined; but it is doubtful if they were not more alarmed by an incident which arose out of it, and which, although it is only amusing to read of now, they evidently found to be no laughing matter at the time. Living at San Antonio was a Russian scientist of somewhat eccentric habits, one of whose hobbies was phrenology, in the pursuit of which he collected the heads of some of the dead Indians as specimens. These he proceeded to desiccate by the simple expedient of boiling them in a cauldron, which he afterwards emptied into the channel in which flowed the drinking-water of the town. Information of this was not long in reaching the ears of the inhabitants, and they were up in arms. In the eyes of the Texan of those days the only good Indian was a dead Indian, they hated him so much; and the idea that they had partaken of boiled Indian was more than the people could stand, and they appear to have gone pretty well crazy. One diarist gives a realistic account of the effect produced: 'The people very properly gathered in indignation; a mob rushed to the mayor's office. The men talked in loud and excited tones; the women shrieked and cried, they rolled up their eyes in horror, and some of them were so frightened that they suffered miscarriage. Many thought they were poisoned and would die.' None, however, did die; the erring professor was haled before the magistrate and fined, and the affair blew over as quickly as it had arisen.

The fear and hatred in which the Red Man was held by the whites is constantly in evidence, and the arrival from time to time of escaped captives horribly mutilated and disfigured did not tend to allay this feeling; but there were also friendly chiefs (*Indios Reducidos*) in the neighbourhood who frequently visited the town. Their presence was, however, only one degree less objectionable than that of their savage brothers (*Indios Bravos*), for, well knowing the fear in which the whole race was held, they took all manner of liberties, loafing about the houses without let or hindrance, as if the whole place belonged to them, and even on occasion demanding a kiss from the white women.

Like other places in the western states, San Antonio had its full share of that product of frontier life, the desperado or outlaw. They were men with many crimes in their records, and were a menace to society; they asked no quarter, and gave none. So dangerous did the pest become that a popularly elected vigilance committee had to be established for its suppression. But, as so often happens in similar cases, the people found that in course of time the cure became worse than the disease; from being a protection the committee became a tyranny and an offence, and had itself to be suppressed.

Typical of the times was the killing of Bill Hart, one of the worst desperadoes in Texas, an event which is graphically described in the words of one of the 'old-timers' who was an eye-witness: 'Bill Hart was killed on 29th May 1857, and along with him his companion Miller and a Government teamster named Wood. Fieldstrop also was killed. Fieldstrop was a discharged soldier, and had been employed by the vigilance committee to watch Hart and his party the night previous; and when Hart and his friend Miller passed on their way down Mission Street they were fired upon by Fieldstrop, who had a double-barrelled gun. Miller was killed, falling in the alley north of Brewer House. Bill Hart, too, was mortally wounded, his right wrist and left thigh broken, besides having eleven buckshot-wounds; nevertheless, he had such extraordinary vitality that he reached the Brewer House, where he took shelter from his numerous enemies. Fieldstrop, having reloaded his gun, approached the Brewer House with the intention of giving Hart the *coup de grâce*, when Wood, the Government teamster before mentioned, came out and ordered Fieldstrop off, saying that he, Wood, was Bill's friend. "That is enough," replied Fieldstrop, raising his gun and firing, killing Wood instantly. At the same moment Hart appeared at the other door, supporting himself on an old shovel-shaft, with a pistol in his left unwounded hand. Immediately Fieldstrop's gun was aimed at Bill Hart's breast, but it missed fire. Hart then instantly fired at Fieldstrop, shooting him fairly in the centre of the forehead. Hart then retired in a dying condition into the back-room of the house. At this crisis Jim Taylor came up and rushed into the house.

Hart shot him as he entered the back-room. Taylor, however, got Hart by the hair of the head, and dragged him into the back-yard, shooting him repeatedly in the body. Then a horrible sight: everybody—the small street gamins even coming in at the death by the dozen—discharging their little pops into the dying man, making a perfect lead-mine of him. Yes, it was a terrible morning's work. He might have richly deserved his fate; but, believe me—and I know of what I speak—these matters are best settled by the law.'

This is a truly appalling picture of the state of society in San Antonio at this time; but if the prevailing impression gleaned from these old-time diaries and recollections is a gruesome one, it must be remembered that the tellers of the tale were, like all pioneers, at constant war with nature and their surroundings; their life was a hard one, and they had to fight for their very existence to the exclusion of all those amenities which go to make up life in this country. They doubtless had their share of the 'daily round, the common task;' but it was the bigger, more startling, events which left the lasting impression, and which leaped to memory when they came to recall the bad times, then rapidly passing away.

All this is now changed. With the arrival of the railway came increasing numbers of settlers. The Indians were driven back and lodged in reservations, where they lead a sad, alcoholic existence, and the desperado is no more. The bison which covered the plains of Texas during certain periods of the year have, with the exception of a few herds carefully preserved, been exterminated, and their places taken by the more profitable, if more prosaic, shorthorn. The land, in short, has been transformed, and the transformation is nowhere more apparent than in San Antonio itself. The adobe shacks of former days have been replaced by fine stone buildings, the sandy roads by well-paved streets thronged by a well-dressed crowd; electric cars run in all directions; there are telephone and telegraph wires; and standing in any of the main thoroughfares of the town, one finds it difficult to believe that here little more than fifty years ago the war-whoop of the Redskin was heard, and Bill Hart done to death. But the old Alamo still stands to remind the modern San Antonian of the stirring days which will never return.

GOD'S COUNTRY—A COMPARISON.

By RALPH STOCK, Author of *A Recipe for Rubber*, *The Brink*, *The Passing of Aunt Deborah*, &c.

FOR a full hour the horses, with their unfeeling sense of direction, had buffeted against the blizzard straight towards their stable.

The man in the sleigh allowed the reins to hang loosely from his half-frozen hands. He knew that this was the hour when brute instinct rises superior to human intelligence; but he

would rather have lost a hand than admitted as much to the woman at his side. He was hopelessly, irretrievably lost. In vain he tried to recognise every hill they climbed. In the whirling, blinding muzz every sage-bush was a house, every stone a well-known landmark.

Suddenly one of the horses stumbled and fell,

a steaming, exhausted tangle, and the man knew it was the beginning of the end. He brought the willow gad, a thing he had never carried before, down on to the poor beast's heaving flanks with all the force of desperation. 'Can't help it, old man; we've got to get there,' the man mumbled apologetically through his high fur collar.—'Are you very cold?' he asked, turning to the woman.

'I'm not hot,' she replied, with a brave little laugh almost stifled by the Persian lamb collar that covered her mouth. 'But, Ralph,' she added, turning to look into the man's eyes, the lashes and brows of which were coated with a white rime, 'are you sure you're on the trail?'

'Oh yes,' he said lightly. 'Can't you see it—there, just ahead of the horses?'

The woman leaned back with a sigh and nestled closer to him. 'I suppose you thought it necessary,' came an almost inaudible voice at his side, and he turned abruptly.

'What, dear? What was necessary?' he queried anxiously.

'To lie to me,' returned the woman; and at that moment both horses went down simultaneously. Down, down! The sleigh seemed to turn a somersault, the occupants being shot into icy-cold air, the next moment to be buried in a smothering, enveloping bed of soft snow.

The man had never relaxed his hold of the woman, and for a few seconds they lay quite still. Suddenly he struggled to his knees. 'Grace! Grace! are you hurt?' he whispered, his voice full of an agonised suspense.

'Not a bit. Are you?' came the cheerful response.

'No, no, thank God! Are you sure? Can you walk?'

For answer the woman allowed him to help her to her feet, and staggered out of the drift.

'We're all right now,' said the man cheerfully. 'This is Cooper's cut bank—must be. One mile more and we're there.'

'Say you think so,' corrected the woman, with a faint smile. 'Please don't tell any more; you must think me a coward.'

'You're a brave little trump,' cried the man.

'No, there's no need for any more.' Then he looked round. 'Where are the horses?' he exclaimed suddenly, and staggered off into the swirl.

When he returned a few minutes later, breathless and perspiring from the exertion and his heavy fur coat, the woman was sitting in the snowdrift where they had fallen, and his quick eyes detected a tiny white spot on her left cheek.

'You mustn't sit still, dear,' he said, and dragged her to her feet almost roughly; then, catching up a handful of snow, he rubbed her cheek with a vigour that brought a cry to her lips; but his object was gained.

'I feel tired,' said the woman.

A look of despair came into the man's eyes.

'Yes, I know, dear; but you must try, try

hard, to pull yourself together. We shall have to walk; it's only a mile. The horses must be all right; they've broken their traces and struck off. We'll follow their tracks, and'—

But the woman's quick wits caught at the slip. 'Then—then—this isn't Cooper's cut bank?' she faltered.

Once more their eyes met.

'No,' said the man slowly, 'it can't be. I really went just now to make sure if it was, and it wasn't.'

'Thank you!' said the woman quietly, and took his hand.

Together they plodded on in the horses' tracks. The wind against them bore with it its myriad stinging white specks that seemed to pierce the skin like needle-points, each one adding its mite to the obliteration of the guiding hoof-marks. How long would it take her to see that they were following nothing? Twice he tried to bring himself to tell her, but the words stuck.

'I'm sorry, Ralph,' her voice came at last between little, short gasps; 'but I can't go any farther. Something seems to have gone wrong just—just above my heart. I'll—I'll have to rest.' She sank down into the snow. 'And now,' she said as he leaned over her, gazing down with infinite tenderness and utter despair, 'I want you to prove that you love me.'

'How—how?' he said vehemently, kneeling at her side. 'Only tell me what I can do.'

'Leave me,' was the quiet rejoinder. 'Oh, I don't mean anything tragic,' she added, as she saw the futility of her request reflected in his face, and she laughed a breathless little laugh. 'I mean, just you go on to the ranch and bring back help.'

The man looked down at her with a smile of admiration, wondering if there were such love in any other woman, then away into the white nothingness.

'Curse such a hole!' he muttered irrelevantly.

'Grace, if we ever get out of this, it's "God's Country," mind; "God's Country" or nothing.'

'Please go,' repeated the woman.

The man turned almost viciously. 'I won't; so that ends it,' he said harshly, and then broke into useless self-accusation. 'Good God! here am I babbling like a fool and you sitting there freezing.' He stamped his foot with sudden impotent fury at his own helplessness; then quickly ripping off his coat, he flung it over the woman and caught up her struggling form in his arms.

'Lie still! Lie still!' he hissed. 'I mean to carry you.'

By sheer dogged endurance rather than physical strength, he carried her thus for perhaps half a mile, perhaps a mile, till at length, with a stifled moan, he pitched forward on his face in the snow, a nerveless, exhausted heap.

'God help me, Grace! I can't go another step,' he gasped; then, as no answer came from the huddled fur beneath him, he struggled to his

knees and tore frantically at the fur collar that hid her face.

'Oh God,' he gasped, 'give me strength!' and, seizing her insensible form in an iron grip, he shook, pommelled, and struck her with his mittened hands.

'Ralph, don't—don't; you hurt!' came a weak voice at last.

'Are you frozen anywhere? Quick, Grace, tell me! There, can you feel that?'

'Feel what?' asked the woman drowsily. 'I've always heard it's an easy death, and we're together, aren't we? It really doesn't matter much. I think I'll—go—to—sleep—now;' and once more the heavy lids drooped over her eyes.

The man looked round wildly as though seeking aid in the desolation of whirling snow. The cold had penetrated to the woman's brain at last; he realised it, and could do nothing. With a supreme effort he felt in his pocket, and brought out a match in his naked hand; then he struck it on his trousers and carefully shielded it from the wind in the hollow of his hands. He waited until the flame had taken firm hold; then, with a repulsive shudder, he applied it to the tender white flesh, and sank back unconscious as the woman's eyes opened in sudden pain and terror, and her ears caught the faint tinkle of approaching sleigh-bells.

The electric brougham skidded on the slippery asphalt, recovered itself, skidded again a trifle farther, and finally came to an ignominious full stop in the gutter. The man inside thrust his head out into the choking pea-soup fog with a muttered imprecation.

'Walker! Hi, Walker! Hallo, you there!' He broke off, suddenly discovering the chauffeur's face not six inches from his own. 'What the deuce is the matter? Anything wrong?'

The chauffeur, converted into a misty apparition by the fog, stood at the carriage-door, the personification of apologetic annoyance. 'Sorry, sir, but the roads, and the new batteries'—

The man flung open the door with unnecessary violence. 'Hang technicalities, and hang electric broughams! Can you get the thing to move to-night, or must we get a hansom?'

'I'm afraid, sir'—began the chauffeur.

'Then it is a hansom,' snapped his employer. 'Hurry up, man, before we're asphyxiated.'

The chauffeur vanished, and the man returned to the brougham.

'Worst of these tin-pot, handbox affairs!' he grumbled to the woman who sat in the far corner enveloped in a fluffy opera-cloak, holding a dainty handkerchief to her mouth and nose.

The woman removed the handkerchief, revealing a pretty enough mouth, though hinting ennui by its slightly drooping corners. 'If you'll kindly come in, or stay out, but at any rate shut the door,' she remarked acridly, 'I may escape with a chill.'

They sat in silence for a few minutes, the woman staring listlessly through the window, her gaze fixed on a dim yellow blur that indicated the neighbourhood of a street lamp; the man crossing and recrossing his legs spasmodically.

'A live donkey's better than a dead—handbox,' he observed at last. 'I wonder when that idiot is coming with the hansom!'

'Why don't you discharge him?' said she through three layers of handkerchief. 'You know he doesn't understand his work in the least. I do believe you're afraid of him.'

'Good chauffeurs don't grow by the wayside. The man knows his proper work well enough; but a plaything like this! He's not expected to be an electrical engineer. And as for being afraid of him, my dear girl, if Walker conveyed the same terror to my soul that your maid—Hullo, thank the Lord, here he is!'

The chauffeur stood once more on the curb-stone, his face expressive of a consternation even he was unable to hide. 'Kebs not running, sir; can't see yer 'and'—

The man leant out of the window and glared hopelessly round. 'Do you mean to say we must walk in—in this?'

'Fraid so, sir. There's the "Albany"—temperance hotel—just'—

'Don't be funny, Walker; the occasion doesn't call for mirth. Where are we?' The man turned to the woman. 'The Heatheringtons may have a garden and a carriage-drive, but if I had to live in these infernal suburbs to get 'em I'd'—

'I don't think talking will do much good; do you?' the woman suggested with a mildness palpably artificial.—'Where did you say we were, Walker?'

'He didn't say where we were,' the man interrupted testily, 'for the simple reason that he doesn't know. Come, we must walk.'

There were tears of vexation in her eyes as she gathered her skirt about her and stepped down on to the slippery, wet pavement.

'And now,' she said as they dived blindly into the fog, 'where on earth are we going?'

'Haven't the least idea,' said the man with forced cheerfulness; 'but we're bound to get somewhere in time.'

'These hateful shoes!' said the woman. 'Don't walk so fast, Ralph, or I shall sprain my ankle.'

'Never could see why women have to wear stilts on their heels,' muttered the man. 'Come now, we're getting to something,' he added a trifle more cheerfully as a dull glow ahead converted the fog into a lighter shade of biliousness. 'Last time I forsoke the club for idiots who choose to live the other side of nowhere.'

The woman coughed an inaudible rejoinder, and they emerged into the ring of light—a street light, that was all. They moved on once more.

'We ought to hit the Edgware Road soon,' said the man, 'and we can take the tube from

there. That mode of locomotion defies any atmospheric conditions.'

'Say you *think* we'll hit the Edgware Road,' corrected the woman, and the man looked suddenly down at her with the puzzled frown of one striving after a half-forgotten memory; but the discomfort of the moment forced it to the background, and it slipped by.

'One thing's certain,' he continued, with added conviction, 'we shall never get anywhere at this rate. Look here, I think I'd better run on and hire anything on two wheels that I meet, if it's only a coster's barrow.'

'And leave me here'—the woman began, and checked herself.

'Unless you care to run with me,' suggested the man ironically. 'I do wish you wouldn't be so difficult, Grace, especially when we're in a fix like this; if you had on anything else than those ridiculous shoes it would be different.'

'Very well; hurry up!' she said.

When he was gone the woman leant back against a wall and closed her eyes. 'I wonder why I should have thought of it to-night,' she murmured. 'I suppose it was the weird similarity and the still weirder difference; the cause was much the same; but the effect!' and she laughed a little, short laugh. 'What can have made us so different in seven—no, eight—years?'

The man kicked the fire into a blaze, and the woman sat dreamily watching the flames, her chin between her hands, a far-away look in her eyes.

'Has it occurred to you yet,' she asked at last quietly; 'the similarity, I mean, between last night and—and a certain night eight years ago?'

The man rose abruptly and stood looking down at her. 'Yes,' he said, 'it has.'

The woman looked up in unfeigned surprise. 'I wondered if you noticed it,' she said with a strange diffidence. 'I thought—I thought you probably wouldn't remember—this.' She drew aside a broad necklace of pearls to show a small, puckered scar that it hid.

The man put out his hand and touched the spot gently.

'Yes, I remembered it,' he said slowly.

'When?'

'Just after I left you in the fog.'

'And how did it strike you?'

The man turned and flicked his cigarette-ash into the fire. 'It knocked me all of a heap for a minute,' he said.

The woman smiled. 'Only for a minute,' she mused. 'I wish—I wish I could forget it as quickly.' She continued as though talking to the fire. 'We made more fuss last night, Ralph, over having to walk a mile and a half in a fog on solid pavements to a railway station than we did eight years ago plodding knee-deep through snow in a raging blizzard, with the thermometer at forty below and certain death staring us in the face. Why is it, Ralph? What has made all the difference?'

The man shrugged a pair of broad shoulders. 'Circumstances, environment. Everything here is so small; we're bound to get small too.'

'But as small as we were last night?'

'Yes; probably smaller before we're done.'

The woman suddenly clenched her hands. 'I hate it!' she exclaimed vehemently. 'Oh, I hate it all! Little "At Homes," little dinners, little theatre parties, little this and little that. I want to see something big, Ralph, if it's only the North Atlantic. I want to see rivers that dry up'—

'You want to see the prairie!' The man's eyes held the sparkle of awakened ambition. 'Good Lord, so do I! I've wanted to for—yes, the last seven years.'

The woman looked up at him. 'Why didn't you say so before?' she asked reproachfully.

'I thought you—I thought this was God's Country, Grace.'

'So did I,' said the woman; 'but I want to go back. Let us go back.'

The man laughed a glad, boyish laugh. '"The call of the snow-bank," we must call it, Grace. I wonder where God's Country really is.'

'I think,' said the woman, her gaze returning to the fire, an added colour creeping into her cheeks—'I think it must be wherever love is, Ralph.'

COMEDY AND TRAGEDY IN THE 'R.L.O.'

IN the postal service the Returned Letter Office is generally spoken of as the R.L.O. This department deals with all correspondence which postmen have been unable to deliver. Such correspondence consists chiefly of wrongly addressed and badly addressed parcels and letters. After all efforts to hand these in at the right addresses have failed they come under the charge of the R.L.O., which either returns them to the senders or keeps them until called for.

A few years ago the Post-Office played a sad

trick on the public—more particularly the sweet-hearting part of it. Tinselled picture post-cards had become quite the rage, but unfortunately the tinsel used was of a poisonous nature. So, in order to protect his staff, the Postmaster-General ruled that all such cards should be placed in covers before being sent through the post. If posted contrary to this regulation they would be destroyed. The large stationery shops soon provided transparent envelopes to meet the difficulty, but the British public did not pay

much heed to the new decree. The consequence was that the R.L.O. had the time of its life. Thousands of pretty, sparkling cards with loving messages inscribed thereon found their way into this department, where they were ruthlessly disposed of. What misunderstandings must have arisen throughout the land! Jack would not receive Ethel's dainty message written in the corner of a bespangled Tower Bridge. What must—— But words fail at the very thought of what must have happened.

On one occasion an old lady in the country wrote to the Postmaster-General informing him that she had posted a Christmas present to her boy in London. Unfortunately she had put on a wrong address. She was sorry to give the Post-Office so much trouble, and doubtless 'his honour' (the Postmaster-General) would be worrying about having the packet on his hands. Would he please send it back to her at once? Could the dear old creature have had but a glance round the R.L.O. during that Christmas season, she would never have risked sending another parcel by post during her lifetime. Surely, had she seen the thousands of undeliverable packets and letters, derelict turkeys, and unclaimed fowls and pheasants, she would have given up all hope of ever seeing her property again. Indeed, every Christmas season leaves the postal authorities with a great amount of poultry on their hands, for which owners cannot be found. Labels have been torn off in transit, so that trying to find the right addresses is a hopeless task. The authorities do the next best thing possible. The stuff is sold, and if claimants turn up they receive what cash the sale realised. Thus a dead loss is avoided.

It is extremely difficult to convince some people that it is possible to make mistakes when addressing postal matter. One morning, some little time ago, a fierce-looking gentleman arrived at the R.L.O. He was apparently breathing dreadful vengeance on every one connected with the Post-Office, and quite scared everybody in the building. At length he snappishly explained that some few days previous he had sent off a packet to a friend, who had not received it, and he wanted to know the reason why. He gave the name of the street, and the number of the house was 38. The official who listened to his tale answered not a word until the end of the recital. Then, asking to be excused until he looked the matter up, he retired, and returned in a few minutes bearing the undelivered parcel. The number plainly written on it was—28. Finally the gentleman half-heartedly apologised. He couldn't believe he had made such a mistake, and almost inferred that the postal officials had changed the figure just out of pure cussedness. Unfortunately for the Post-Office, this type of gentleman is much too common.

An amusing case was that of a well-dressed young lady who one afternoon found her way

into the house of 'dead letters.' Tackling the first clerk that crossed her path, she explained to him that about a week before she had despatched a small parcel to her cousin. Since sending it off she had discovered that it had been posted to the wrong address. Doubtless it was in the office; she would just take it with her. The official explained that every returned article was examined and 'booked' before being given up to any claimant. He was sorry, but hers had not as yet been dealt with. But if she would call again in a day or two she would be sure to receive it. 'Why can't you lay out all parcels on a table?' she demanded. 'Then people could come in and pick out their own property at once. I am sure I should know mine if I saw it.' The man smilingly pointed out to the would-be postal reformer that it would also be possible for some one to come in and take away something that did not belong to him. The dear, innocent lady had never thought of that.

A case is recorded where a letter was delivered at a certain house in a north-country village. It was to a gentleman who had died there a couple of months before. The new occupier of the house wrote 'Dead' across the envelope, and returned the missive to the post. A few days later, through some mistake or other, the postman brought it back. By-and-by the postman found it on his hands once more. Finally it reached the R.L.O., where a dignified clerk was seen to smile a red-tape smile as he read: 'Dead and buried. Address unknown.'

There are, however, many tragedies brought under the notice of the R.L.O. officials. Many letters have to be glanced through in order to gain some clue to the addresses of the senders. The following is a good example. It was an express letter, but had been returned. It was from a despairing wife to her husband, who was apparently at work a long distance from his home. She wished to know why he had not written for so many weeks. She and her child were starving, and with her last sixpence she had despatched this letter. But the postman had been unable to deliver it. For written with cruel boldness across the envelope was the one word, 'Deceased.'

SONNET.

MIDNIGHT! Away in yonder western sky
The embers of the sunset smoulder still.
A faint blue haze lies on the distant hill,
And hovers o'er the stream that tranquilly,
Past field and shadowy hamlet, evermore
Draws its hushed waters to the open sea.
Nought of the night is anywhere; only
Its silence, sinking, sinking down on shore
And sea, on land and house-top. A light air
Is stirring gently seaward; but the trees
Are mute, their faintly green, transparent leaves,
Like blossoms, in the twilight, gleaming fair.
Day treads on Night; that ebbing light, anon,
Drifting eastward, will mingle with the dawn.

MARY C. CHRISTIE.

Chambers's Journal

SEVENTH SERIES

ON THE SKIRTS OF THE LAMMERMOORS.

Oh wild and stormy Lammermoor!
Would I could feel once more
The cold north wind, the wintry blast,
That sweeps the mountains o'er;
Would I could see thy drifted snow
Deep, deep in clough and glen,
And hear the scream of the wild birds,
And was free on thy hills again!

LADY JOHN SCOTT.

A HEALTHY sign of the times is the increased attention paid to local and county history and topography. More than a hundred years ago Sir John Sinclair pointed the way with his *Statistical Account of Scotland*, which for the first time gave a history of all the parishes. Now we have county and local histories innumerable, beautifully illustrated county geographies, general guide-books, and guides to every town of importance. In the great *Victoria History of the Counties of England* an attempt has been made to cover all the English counties. From time to time books on several Scottish counties have been published, but met with slender success. It is no fault of author or publisher if any human being remains ignorant of the district or county in Britain in which he lives. The beaten track of the tourist, such as the Shakespeare Country or the Land of Scott, has even a chance of being overdone. Yet in Britain, at our own doors, there are still possibilities of at least disclosing beauty-spots and places of historic and biographic interest, in spite of all that has been written. To prove this, Mr A. G. Bradley, who is known as a picturesque and entertaining writer about the highways and byways of English scenery, has invaded Scotland from Berwick-on-Tweed, and in his *Gateway of Scotland* (Constable and Co.) makes a picturesque survey of the Merse, the Lammermoors, and East Lothian. Mr A. L. Collins has supplemented his efforts by fine line-drawings and coloured illustrations. It may be pointed out, by the way, that the Carlisle route is also a gateway to Scotland no less than Berwick-on-Tweed. The enthusiasm of the writer is infectious; and he has done for this region what has not been so well done before. We learn the significance of many familiar places and things, and Mr Bradley has a good deal of the gift of Sir Walter Scott, the most luminous example of a man who 'felt a country.' Mr Hilaire Belloc is here credited with the saying that a man sees just as much as he is fit to see, and no more. Thomas Carlyle said this in rather a better way before Mr Belloc was born. Only

a few golfers, we are assured, know anything of East Lothian, and that but in a limited way. Their knowledge is bound to be limited, as the first principle of a good golfer is to keep his eye on the ball. Who does not know the famous golf-courses of North Berwick, Gullane, Muirfield, Archerfield, Luffness, and Kilspindie? The motorist who moves swiftly from point to point knows just a little about the county, and more about the various inns at which he calls a halt. The passenger by rail from the south, in that wonderful sixty miles between Berwick and Edinburgh, gets only kaleidoscopic glimpses of the country. So the efforts of an Englishman to show the Scottish nation and the rest of mankind what an invaluable asset it possesses in these counties may be warmly welcomed.

There have been other recent labourers in the same field, including John Martine, who has published books of reminiscences concerning the county and town of Haddington, and D. Croal, who has written *Sketches of East Lothian*. Mr Charles Green, an Edinburgh publisher, issued his beautifully illustrated book on *East Lothian* in 1907. In his opinion it is the most charming of Scottish counties, and as a whole the least known. Mr Green's historical, biographical, and picturesque notes are crisply expressed and well informed. Another writer, Mr Francis Watt, in *Edinburgh and the Lothians* (Methuen & Co.), devotes nineteen pleasantly gossiping chapters to the Scottish capital, and six equally interesting chapters to East Lothian, in which he is very much at home in regard to scenery, history, and antiquities. Mr W. Dexter is responsible for the twelve coloured illustrations. Mr Watt's Lammerlaw chapter gives the pleasures, discomforts, and humours of a part-walking, part-cycling excursion across the Lammermoors. Mr Bradley asks if there are any people wandering as Young, Pennant, or Cobbett used to do. We must add our authors to the number, although they are less opinionative regarding what they went out to see. Mr Bradley is the most picturesque writer in our list.

After wanderings in England and Canada, Mr Bradley comes back to what was a love of his youth, the Border country—'a revisitation rather than a fresh departure.' He enjoys himself in his cycle-rides, walking, or fishing excursions to the Whitadder; converses with cottagers, innkeepers, farmers, and shepherds;

FEBRUARY 8, 1913.

and adds to our store of anecdote thereby. He believes that the most attractive scenery in Britain is to be found among the foothills of moors and mountains, and he tells us more than once that East Lothian is the best-farmed county in the United Kingdom, 'the finest county in Britain—nay, in the world; . . . a vast garden lying between a rocky, broken coastline and a wild waste of moor.' He leads the reader through Berwickshire and across the wild moorlands from Ellemford to the north edge of the Lammermoors, and tells him that he lifted his hat to 'this rich-tinted, rolling carpet of East Lothian, girt about with wide waters and framed with shadowy mountains.' The Garleton Hills, near Haddington, form another splendid point of vantage much eulogised by Samuel Smiles in his *Autobiography*. The Lammermoor range of hills in East Lothian and Berwickshire stretches from Soutra Gap eastwards to the German Ocean at Fast Castle, the Wolf's Crag of Scott's *Bride of Lammermoor*. Of the main tracks across the hills, one from Haddington to Duns climbs from Garvald, with Mr Balfour's seat of Whittinghame on the left, and Lord Tweeddale's Yester estate on the right, and passing the source of the Whitadder at White Well, follows the vale of the Whitadder towards Duns. This was the route taken by Marmion in his journey north. Another leaves Long Yester, near Gifford, and crosses by Lammerlaw and Kelhope Burn to Carfrae Mill Inn. There are at least a score of old circular camps or hill-forts on the East Lothian side of the Lammermoors, perched mostly on the tops or sides of the hills. Mr Bradley tells the hardy pedestrian that he might walk thirty miles eastward along the higher ridges of these moors, among heather and peat-bogs, grouse and curlews, and on a clear day look over half of Scotland upon his left hand, and half of the Borders on the right, without meeting any one save a stray shepherd.

While famous for methods of agriculture, East Lothian has a record for eminent men. According to a tablet placed at Giffordgate, in Haddington, by Thomas Carlyle, John Knox was a native; he has also been claimed for the villages of Gifford and Morham with less show of probability. John Major, a teacher of John Knox, was born near North Berwick. Sir David Lyndsay, another herald of the Scottish Reformation, may also have been a native of East Lothian. Two of his poetic predecessors, Dunbar and Gavin Douglas, were also born in East Lothian. Haddington parish church holds the dust of the Lauderdales; of Jane Welsh (wife of Thomas Carlyle); of Dr Welsh (father of Jane Welsh), a Haddington practitioner, described as an agreeable, cheerful man whom everybody loved, with a comely, handsome face and lively and expressive features; and of the father of Samuel Smiles. Messrs Miller & Sons, of Haddington and Dunbar,

were pioneers in cheap literature, and published their *Cheap Magazine* in 1813. Dr John Brown, Secession minister, author of a *Bible Dictionary* and *Self-Interpreting Bible*, was the founder of the dynasty of Browns, of whom his namesake, the author of *Rab and His Friends*, is best remembered. Provost Samuel Brown instituted a system of itinerating libraries, while his son and namesake became famous as a chemist and man of science. Samuel Smiles, author of *Self-Help* and *Lives of the Engineers*, was born at Haddington a hundred years ago. Mr F. Watt is needlessly contemptuous of this useful and interesting writer, who has done so much to inculcate independence, perseverance, and thrift amongst all classes of the community, and who was no mean historian of the lives of men of genuine worth—engineers, naturalists, and inventors. Haddington may well be proud of his solid record. In the *Autobiography* of Smiles there is a living picture of his native town a century ago. His first schoolmaster prophesied that he would only be fit to sweep its streets. Haddington in Smiles's youth was the centre of a military camp; barracks were erected all round it, as Napoleon was believed to have designs for landing an armed force at Aberlady. There were barracks also at Belhaven. The reality of the thing was further impressed on the mind of young Smiles, as his father added to the stock of his shop left-off army stores, chiefly blankets and greatcoats. He saw a shepherd walking off with one of these greatcoats on his back.

Many of the country parishes have also interesting associations. The Rev. William Robertson, afterwards Principal of Edinburgh University, wrote one of his famous histories in the parish of Gladsmuir. The Rev. Robert Blair, minister of Athelstaneford, wrote a sombre poem on 'The Grave'; he was succeeded by the Rev. John Home, author of the tragedy of *Douglas*. The Rev. John Witherspoon, D.D. (1723-94), president of Princeton, the college of New Jersey, and one of the signers of the American Declaration of Independence, was a son of the minister of Yester. Dr Charles Wishart, president of the American college of Carlisle, was a son of the schoolmaster of Long Yester. Gilbert Burnet, afterwards Bishop of Salisbury, and author of a famous *History of My Own Time*, was for four years minister of Salton, and left an endowment for clothing poor children and for a library, both of which schemes are still in operation. Patrick Scougall, afterwards Bishop of Aberdeen, was minister here for five years. Andrew Fletcher (1655-1716) of Salton was a patriot Republican and orator of the seventeenth century, whose saying about the laws and ballads of a country is continually misquoted. He is described as a short, thin man of a brown complexion, full of fire, with a stern, sad look. On Salton estate the first machinery for shelling rough barley into pot-barley was intro-

duced into Scotland from Holland, and installed by James Meikle. His son Andrew Meikle, of Houston Mill, was inventor of the thrashing-machine. The British Linen Company's first factory was on the same estate. The name of Phantassie recalls the Rennies, several of whom became famous engineers. Mr Balfour's estate of Whittinghame has memories of the Earl of Morton, and in the west tower of the house, tradition says, the conference was held between Lethington and Bothwell as to the murder of Darnley. In Bolton churchyard are buried the mother of Robert Burns, a sister of the poet, and his brother Gilbert, who was factor on Lady Blantyre's East Lothian estate, and died at Grant's Braes in 1827. There is a monument to Robert Moffat, the South African missionary, father-in-law of Livingstone, at his native village of Ormiston. John Cockburn of Ormiston has been called the 'father of Scottish husbandry.'

George Hope of Fenton Barns was one of the famous East Lothian farmers, a friend of more than one *Scotman* editor, and a contributor to that newspaper. It was an ancestor of his, a man of a thrifty, calculating disposition, who once bought a church pulpit and a hearse at an auction sale because they went cheap. Every one wondered to what use he could possibly put them. The pulpit he converted into a cattle-trough, a cart was put on the wheels of the hearse, and the upper part of it was transformed into a kind of box-bed, then in use in the country. The driver of the cart shortly afterwards gave notice to leave, and on being asked the reason, said, 'It's thae wheels; they aye pit me in mind o' mortality.'

The locality of Ravenswood House in Scott's *Bride of Lammermoor*, described as standing at the northern foot of the Lammermoors, and at the mouth of a pass from the Merse, Mr Bradley gives reasons for identifying with either Nunraw or Yester House, both ancient seats. Yester, by its greater importance, has the stronger claim; although Edgar Ravenswood and Lucy Ashton may have plighted their troth in the woods at Nunraw. The spot Scott indicates as being between 'Lammerlaw and Traprain.' James Skene of Rubislaw regarded Winton Castle as most likely; while 'Wolf's Hope' was Eyemouth, and the 'Kelpie's Flow' the Links of Eye. There is no ambiguity about another reference: the visit of Marmion and his suite to the village inn of Gifford, and the scene in the now ruined castle of Goblin Ha', near Yester House. It takes some care as well as local knowledge to discover this place in Yester woods, and we blundered twice. Mr Bradley confesses having done so once. It is greatly worth a visit, combining as it does the lovely walk through the woods which overhang Gifford Water. Dunbar Castle, now a mere ruin, has had a stormy record. Dirleton Castle has been uninhabited since it was battered down by Lambert during Cromwell's invasion in 1650. Tantallon

Castle, beyond North Berwick, associated with the Douglasses, is also a ruin. The lonely Bass Rock, with its screaming sea-fowl, was a Presbyterian prison in the time of Charles the Second. Seton Castle, now no more, has memories of Queen Mary, as has also Hailes, a ruin near East Linton. Many plundering and marauding English forces entered Scotland by the east coast. Cromwell's army came this way in the autumn of 1650, and the soil near Dunbar was 'salted down with thousands slain in battle' on 3rd September. At the battle of Prestonpans, during the '45, one of the few heroes on the Government side was good Colonel Gardiner, whose monument, standing at Bankton House, may be seen from the railway in passing. Alexander Carlyle of Inveresk, in his *Autobiography*, has interesting personal reminiscences of the '45, the Prestonpans battle, and Midlothian and East Lothian affairs.

Mr Bradley begins his survey of Berwickshire, that 'fat and opulent farming region,' from Berwick-on-Tweed after fully discussing its history and Edwardian and Tudor defences. Thence either by cycle or rail he follows the Tweed to Kelso. Like a good deal of East Lothian, Berwickshire is a county that the tourist does not feel impelled to visit. But the angler knows the Whitadder and its tributary burns, and we are treated to idyllic descriptions of fishing excursions past and present, with disappointment expressed that the Trout Inn at Ellemford is now a private house. An old fishing-record is recalled. While fishing the Dye Mr Bradley and a friend killed seventy-six trout, the best fish one pound two ounces and one pound one ounce. On the Whitadder recently Mr Bradley and another angler had a large creelful between them. The landlord of the inn at Ellemford is reported to have once killed ninety-six pounds of trout with worm; and on another day thirty dozen fell to his rod. The secret of the fecundity of the Whitadder to-day, after being whipped by generations of anglers, is to Mr Bradley still inscrutable. He thinks its waters may still afford as profitable sport as they did sixty years ago, a statement that will hardly find general credence. When the Fasney Burn was in condition a Gifford postman and his brother caught fifty trout each. We have known an Edinburgh angler and cyclist leave town at four on a summer morning, and ride by way of Blackshiels and Soutra to the Kelphe Burn, walking and pushing his cycle by the track over Lammerlaw to Long Yester. He returned to town in daylight, having covered sixty miles, and with sixty trout in his basket. The names of the other small streams in the Lammermoors where this angler has done even better he would on no account divulge to us. Four miles below Ellemford, on the Whitadder, is Abbey St Bathans, a cluster of cottages, manse, and farm buildings. According to our author, in the whole orbit of the Lammermoor region there is no more delightful retreat.

We cannot here do more than mention Duns, Gordon, Lauder, and Earlston, about all of which Mr Bradley has something interesting to tell. Lauder is commended for its pleasant walks, moorland air, and touch of old-worldness. Duns may have been the birthplace of Duns Scotus, whose tomb is in Cologne. Dr M'Crie and Thomas Boston were natives. Duns has a 'huge sheep country behind it, and a fat grain country in front, a County Council to cheer it up, and looks entirely happy in spite of its resounding paved streets.' There have been over seventy Berwickshire poets, but Mr Bradley wisely quotes only from Lady John Scott and a shepherd-lad.

Mr Bradley has a keen eye for the conditions of agriculture and the agriculturist, and records the successful emigration of suitable Berwickshire men to Canada in the middle of last century. The amount of barley grown in Berwickshire surprised him. He prefers sound ale as a fine and wholesome beverage for the manual labourer to stewed tea, and its accompaniment of anæmic bread and commercial jam, a little butcher's meat, and a good deal of tinned stuff. The writer has heard of a Berwickshire man who put Burns's poems in the fire in case his family

should be contaminated. A Longformacus peasant's opinion of Sir Walter Scott when the announcement of his death was made is interesting. An old lady, a strict Calvinist of the old school, jeered at the expressions of grief, saying, 'Hoots, guidman, he's weel awa'. He was just fillin' the heads o' the folks fu' o' downright havers.' Another, to our knowledge, could see no good in his books because of his treatment of the Covenanters in *Old Mortality*, of which Tennyson had such an exalted opinion. Another anecdote refers to a mother's ideas as to the career of a daughter who was staying with a relative. The girl could neither sew, cook, nor be useful to her mother from the fact that it was not necessary for her to 'dae thae kind o' things.' When the mother was asked how she occupied her time, the reply was, 'Well, she just enjoys herself. Her relation, ye ken, has independent means.' Some time before a retired postmistress had said that in her opinion the rising generation of girls were 'a parcel of feckless hussies wi' a smatterin' o' useless rubbish in their fulish heads; too fine leddies to go out to service, and not sense nor knowledge enough to keep a puir man's hoose.' Let us hope that this type is an exception on the Borders, as elsewhere.

THE SHIP OF SHADOWS.

CHAPTER XV.—LAND HO!

'I SLEPT for many hours, and the good Evan did not rouse me. Luckily, the wind had not risen during the night, or I might not be here to tell the tale. When I came on deck my comrade was at the tiller, the sky clean and rain-washed, and a copper sun was taking heart behind the last of the flying clouds.

'Evan began at once a characteristic vindication of his prophecies of disaster. I felt inclined to tell him to thank God for our luck rather than dance round his fetish, but I was too hungry and too weak to talk. I changed my clothes, and then, under his direction, set about making breakfast, while he steered. Then we went out of sight of that corner of the deck where the red stain was—he pointed aft—'there! that's why I wouldn't sit there to-day—and ate and drank, saying little.

'Was it all real, or was I crazy? Was this silent ghost the craft that had run so merrily out of Saint Pierre? Gerrand! Madge! Hulse! Lowden, the handsome devil! Were they names in a dream? But the flag was still at half-mast; the dog Dugald trotted, whining, fore and aft, round and round, then up and down the companion, looking for the lost; and I knew that close beside us on deck was the red stain; that the sea would keep the vanished men and the woman till one Great Day; and that we were alone, sailing the Ship of Shadows. Some sudden memory of the good-hearted skipper arose—his voice, I

think, when first he offered to take me out of Port o' Spain—and between this, my physical weakness, and my stretched nerves, my manhood nearly gave out. Evan diagnosed my thoughts, and wisely set me to work.

'For the next day or two the deaths of poor Hulse and Gerrand came up fitfully in our talk. I told Evan what I had heard when I listened on the companion-way; but we came to no conclusion, nothing farther than I have arrived at to this day concerning Lowden. Evan was disinclined to think of the things we had seen. "Let the dead lie!" he said at last, looking around almost as if he expected to hear their voices. "This is an accursed ship. Let the dead lie!" and not another word would he breathe again on the subject.

'The run home until we made a landfall was blissfully uneventful. The Fates probably thought that we had had more than our share of happenings. Much to our relief, the wind blew fair. The glass rose and kept steady. A warm sun shone, and I picked up strength every hour. I was a novice at steering; but Evan did the most of this, and between us we managed to keep the ship going, Evan taking our bearings by dead reckoning. Heaven knows what would have happened in dirty weather; but we kept the sails reduced just as Lowden had left her, and, as it turned out, we never shipped a spoonful of water. One evening, just before night-

fall, Evan pointed out to me a long blur on the horizon. "Land Ho!" he said. It was the coast of Ireland, off Donegal, as it turned out, and ere morning the deep-sea light at Fanad Head sent us its welcome greeting. Then the sun slowly painted out the last shadows and morning banks of mist, showing white fleecy cloudlets, flying like a flock of white birds of good omen; all around us, the great crystalline wheel of the sea. The coastline hardened into definiteness, cliffs crowned with green, seas creaming at their feet.

'Now, Evan had been strangely silent (for him) concerning our destination. I had made no doubt that we would run for the nearest port; but even when we saw Ireland he said little or nothing. The sight of land demanded some definite course. I asked him directly where he was making for.

"Well, we can run for Lough Swilly or Lough Foyle; but that, wi' only the two o' us here, means a pilot, an' a pilot means questions, an' questions mean trouble, as sure as there's kail in Kintyre. I tell ye fair, a Board o' Trade inquiry is jist the last thing I'll be seekin' to show my face at." He looked at me obliquely.

"You mean?"

"Well . . . maybe it was a drop o' whusky. Maybe no'. If ye think a mate—an' that's me—signs on as a cook an' bottle-washer on a schooner for a tanned two pounds a month, or for the sake o' his health, ye're welcome! But that's no' my opeenion."

"Tell me nothing you don't want to, Evan," said I, knowing his brittle temper. After all, he had sailed the ship and saved our lives. We had faced death together, and he had shown the fine qualities of a seaman in a crisis, and his little idiosyncrasies never warped a cheerfulness and resource beyond praise.

'His brow cleared a little as he said, "Now, we've no cargo to land, an' between you an' me an' the dog, I'm no' ferry much carin' whether we make a port or no'. We're off the County Donegal, an' wi' a dacent wind like the wan we're gettin' we'll see Scotland soon."

'My heart beat. "Splendid, Evan! The sooner the better!"

"Wait till I've feenished, m'lad. Ye're young. Deleberation is a ferry goot thing." He was silent for a little, casting a glance at me over the bowl of his pipe. I knew that the agreeable rascal was turning over some scheme of his own.

"Yes, a ferry goot thing! Now, look ye! Here we are, sailin' a schooner that doesn't happen to pelong to us. Supposin' we bring her into port, what story will we pe tellin' aboot her?"

"Why, the true story, of course, Evan. Why not?"

"Why not? Ye must be a great gomerl! Because no one will pelieve it, an' them that do will only pretend to. There'll pe a great

pusiness in the courts, as like as no', as if it wass our fault. I'm no' goin' barefoot among thistles if I can help it!" he answered gloomily, then relapsed into silent preoccupation, his eye measuring the sea between us and the coast, and every now and again stealing a look at me. I had but one thought, and that was to set foot again in Scotland; and I urged that we could come to no harm by running for the nearest land, or, for that matter, the Clyde, there to hand the ship over to the authorities and tell the unvarnished tale.

"Come, Evan! we must get home. What's your reason for not running for a port?" I asked again.

'He thought for a moment. "Well, there's a story I'll tell ye aboot a great chief long ago in the Highlands. It's a peety you have no Gaelic, for it clinks far petter in the Gaelic than the English. The English is a poor speech for a story."

'So, by way of answer, he told me that once, in the good old days, a great chief, temporarily embarrassed, had borrowed a hundred head of cattle from a neighbour, but without going through the little formality of informing their owner. The cattle were intercepted and recaptured; but the rightful owner contended that they were twenty head short, and a representation to this effect was made to the chief. "What?" said he. "Things have come to a pretty pass when my neighbours will not take the word of a Highland gentleman!"

"Well?" I asked when he stopped.

"Weel, I'm goin' to sail the ship where I like; an' as for havin' my reasons, ye'll chust have to pe takin' the word o' a Highland chentleman for them."

'With this parable I had to be content, for he would say no more, remaining for the rest of the day as silent as a Trappist monk.'

CHAPTER XVI.—'TIME TO LEAVE HER.'

'THE course of *The Ayrshire Rose* was altered a point or two under his orders, the Irish coast just visible on our starboard.

"I suppose we must bring her to some port, Evan," I said. This would surely unbend him.

"I'm no' sure o' that," he grumbled.

This was irritating and mystifying, and I asked him again point-blank to speak out and say what he meant. He wriggled mentally and physically, and hesitated. Now, there's no surer index to a man's thoughts than what he says in a temper. I deliberately set about to rouse his, and bring matters to a head.

"Perhaps you want to steal the ship?" I said.

'I should have got only my deserts if he had cuffed my ears; but he merely rose, ran a blazing

eye over me from head to foot, turned his back, and went slowly forward.

'I left the tiller for a moment and ran after him instantly, ashamed and penitent.

'Then the hurricane of his anger broke out, and I listened to many unrepeatable things in English and Gaelic, until I begged his pardon humbly, and confessed that my words were only a ruse to get at his mind.

"By the Holy Iron! it's chust as well. If I thought that ye would pe meanin' it, it's nefer again wad I break speech wi' ye. Maybe I am wanted for a smahl bit o' smugglin', but I'll have ye know that Evan Macleod iss an honest man."

'Lo! the murder was out! Evan, honest man, had visions of being laid by the heels ashore for a bit of smuggling.

"Is that all, man? I'll help you," said I, vastly relieved.

'He was still snorting a little, but his face visibly brightened and he shook my outstretched hand. Then he unbosomed himself. He had been caught in a little deal in smuggled saccharine from the Baltic.

"Ye see, mine's a kent face on Clydeside! They let me out on bail, though the lawyers chairged so much that I've whiles thought I was better to have stopped in jyle. I've neither wife nor bairn, so I chust slipped my cable. It's ahl ferry well comin' quietly back as I intended, an' gettin' paid off the ship an' takin' my chance. I wad have risked that. I've done it pefore. But it's anither pair o' breeks to come back in a schooner wi' her name chainged, nopody on board but you an' me an' the dog, an' a story o' death, murder, an' suicide, fit for the *Polis News*. No. There would pe a fine pusiness. I'd be up against the whole clamjamfry o' the law, fra' the Lord Adv'kit to the nicht-bobbies on Greendyke Street by the Broomielaw."

"There's nothing for it but to risk it, is there?" I ventured.

"Risk it! I've risked enough in this cursed vessel to last my turn. I'd as lief risk offerin' a bun to a shark as risk the law. If I get clear o' *The Ayrshire Rose* mess, they'll get me on the smugglin' bail. What they'll pe losin' on the swings they'll make on the merry-go-rounds, as the man said. I tell ye straight, I'm no' goin' near a port."

"Run her ashore? That's as bad."

"Worse. We would be seen. I'm goin' to leave her." He struck into the old chanty,

The seas were high, the winds were strong;
Leave her, Johnny! leave her!

It will pe as easy as tumblin' out o' yer bunk. Get her close inshore; then"— He pointed to the ship's boat.

'My face instantly reflected the hundred difficulties I foresaw, for he coolly said with a grin, "An' ye'll have to join me, my lad, for ye wouldna think o' sailin' the schooner a knot by

yersel', unless ye want to join the rest o' the ship's company wi' Davy Jones."

'This was true, and he saw that I knew it. Although I argued for the best part of the day, he was adamant.

'After all, I owed Evan a good deal, and he had nursed me as tenderly as a woman when I was ill. Ultimately I gave in, and we set about immediately to conceal *The Ayrshire Rose's* identity. I don't know that this was quite necessary, but Evan was all for being sure rather than sorry. We began by swabbing the decks. I was glad that Evan took the after-deck, where the red stain was, as part of his job. We did the business thoroughly.'

'You did,' I cut in. 'There wasn't a scrap to identify her by.'

'That's so. We emptied the lockers, down to the pockets of the dead men's clothes. We burned or threw overboard every scrap of paper, the log included. It was a sad task, and we went through it silently. I remember the little feminine fineries, the photographs, the woman's hand plain in the tiny stateroom. But it had to be done, and doing it thoroughly kept me from thinking. Evan burned the combing of the hatch bearing the ship's number, and threw the bell, with the schooner's first name, *The Honorine*, on it, over the side. Then we swabbed the deck again, and *The Ayrshire Rose* looked as clean and innocent as her name.

'Fortune favoured us. The wind was kind, the schooner as easy to handle as a perambulator, and soon the blue line of Kintyre on the quarter heralded Old Scotland.

"I'm in two minds what to do," said Evan, poring over the chart. "I'm no' aquent hereabouts."

'I doubted him, but said nothing. Together we had a look at the chart, and suddenly I remembered that I knew my bearings in the reaches of the Solway.

"It's Providence," he cried when I told him this. "An' the wind in the westward!"

'Promptly the schooner's figure-head was set for the North Channel, and we began our last day on board.

'By the dog-watch we were astern of the light of the Mull of Galloway. Not a topsail fretted the horizon. The wind was scarcely rippling the water. Everything conspired in our favour, and about two in the morning Evan threw the lead for the last time.

"By the deep, three!" he said. "Time to leave her."

'We gave her a last overhaul, and then sat down to a square meal. There was some money, ten or eleven pounds, and we made no bones about dividing it in proportion to our rating. I swear we had worked hard enough for it.

'We shut the dog Dugald in the cabin with some food and water. He would have jumped after us, and we knew some one would find him

on board. Strange that it should have been you! We left just enough sail on her to keep her under way, and run her up the Solway with the tide. Then we lowered the boat and got into it. The schooner towed us for a minute or two, until Evan cast off.

'The dog howled dimally, some instinct telling him that he was being abandoned. Very little would have made me turn back for him,

but I hardened my heart, and we bent to the oars. Dugald's voice reached us at intervals, like some melancholy spirit calling, "*A-lone! I'm a-lone,*" until it died in the distance; and soon all we could see of the ship that held such dark memories was the glow of her port light, its image following her furtively, shimmering red on the water like a blood-stain.'

(Continued in following section of this part.)

BUTTER-WEEK IN MOSCOW.

By JEAN D'AUVERGNE.

TO those who have already visited Moscow at this time of the year there will be no need to explain the meaning of butter-week (or *Maslyanetsa*, as it is called in Russian). They will know only too well from personal experience its fatal attractions. There are others, however, who do not know of its existence, and who have never even heard the magic word *bleenyee*, and to them a word of explanation may prove interesting.

Butter-week is the week before Lent, which, by the way, begins in Russia on a Monday—that is, two days earlier than in England. It is called thus from the fact that the butter and eggs, so beloved by all Russians, are animal foods, and are, therefore, not eaten by the truly pious during the fast. Seven days, then, are set aside for special attention to these edibles, and so Carnival-week in Russia is a week of inordinate feasting, in which butter and eggs play a very important part.

Bleenyee are the pancakes on which the butter and eggs are served. Let it not be imagined, however, that a Russian pancake has any resemblance to its English counterpart, or that Butter-week is a Shrove-Tuesday multiplied by seven.

In England, Shrove-Tuesday comes upon most of us before we have realised it. In one or two homes, or perhaps in some old-fashioned restaurant, a spongy and unpalatable slab dressed with lemon and sugar so as to resemble a pancake is still eaten; but for most of us the day passes without even an afterthought.

It is not so in Russia. On the first morning of Butter-week you will notice a strange gleam in the eye of your fat Russian friend. If it is your first visit to Russia, you will be kept in suspense until luncheon-time. Then the mystery will be revealed to you. The table is loaded with *zakootska* of every shape and description: caviare, sour herring, beaten eggs, *smetana* (or sour cream), butter sauce, pickled cucumber, aspidines, and all the thousand and one other dishes which compose this most strenuous of Russian courses. Madame smiles across the table to her husband, and then turns to you with a pitying shrug of her shoulders as much as to say, 'Now we will show you what we Russians

can do.' The utmost good-nature prevails. Even the heavy and lethargic maid has a smile for everybody and a clean apron for herself. All is now ready for the battle, and the fray commences.

The maid retires to the kitchen, to return presently with a steaming plate of *bleenyees*. As the guest of the house, you are served first. You take the round, innocent-looking pancake on your plate and look about for the sugar. But no! The *zakootska* are handed to you in a manner that admits of no refusal, and you spread as many delicacies on your pancake as it will hold. While you are still gazing in a bewildered fashion at the strange heap on your plate, you notice that the others have already finished their first pancake, and that a second round is being served. You take courage, and find the taste not unpleasant. For you, however, two, or at the most three, *bleenyees* will prove sufficient. Not even the warmest friend of Russia can call her cuisine light, and *bleenyees* are not the lightest of even Russian cooking.

While every one, including the maid, smiles pityingly at your incapacity, you have time to observe what your neighbours are doing. The young student opposite has already, with the aid of knife and fork and fingers, demolished and washed down with copious draughts of *vodka* some twelve or thirteen pancakes, and now lies back in his chair in, as you imagine, a state of collapse. He is only resting, however. The others smile encouragement, and madame whispers to him gently, 'Take breath, Ivan Ivanovitch!' And, to your astonishment, Ivan Ivanovitch returns to the attack with renewed vigour some few minutes later.

The daughters, too, play their part manfully, and it is not until the meal has lasted some two hours or more, and some six dozen *bleenyees* have disappeared, that an end is made. With a sigh of complete satisfaction, madame struggles to her feet. The meal is over, and all retire to sleep until the evening. And so it continues for seven days, until the sight of even a single *bleen* makes one's gorge rise with nausea.

One might have imagined that in Moscow, at all events, after the lavish hospitality bestowed upon the English and French deputations which

recently visited the city, the inhabitants would have had enough of feasting and to spare. Quite the contrary is the case. Previous dissipation seems to have served only as a preliminary training, and Butter-week last year was celebrated with even more indulgence than usual, and the death-lists of 'victims of the Maslyaneetsa' were prominent in the local press.

The eating of *bleenyee*, however, is only one form of entertainment during Butter-week. The nights, too, have to be spent in riotous living. The correct thing to do is to go for a *troika*-drive into the country, ending up at two o'clock in the morning with a visit to *Yar*.

During this week the *troika*-drive plays an important part in the Russian's life, for the ride through the cold, freezing air, with the thermometer at twenty degrees below zero, soon drives away all effects of overfeeding, and gives fresh strength to resist the wiles of sleep.

Yar (our English word 'yard') is, perhaps, the finest music-hall in the world. It is more than a music-hall; it is a restaurant, dancing-hall, and music-hall, an 'Empire' and a 'Maxim's' rolled into one. Although the building is superbly and extravagantly fitted up, there is nothing refined about the entertainment. A Briton—or indeed any one except a Russian—would hesitate to take his wife to such a place. Not so the Russian. Here you will see him in all his Asiatic glory, smiling fatuously on the heavy, tired, and jaded women who provide for his enjoyment. Here every night scores of bottles of champagne and other wines will be consumed, and the rich Moscow merchant will think nothing of spending some eight or nine hundred roubles

on a supper-party which is prolonged until half-past five in the morning, when the weary revellers drag themselves home to snatch a few hours' sleep before returning to their struggle with the *bleenyee*. And for seven days this continues, excess exceeding excess, until the climax is reached in a final orgy at *Yar* on the Saturday night.

It is almost impossible for a stranger to realise the amount of money that is spent annually or the fortunes that are dissipated in places of this description. But *Yar* plays a large part in Moscow life, and has been the scene of many comedies and still more tragedies, and in Butter-week it is at the zenith of its glory.

It is difficult, too, even when one has seen life in every corner of the world, to realise the extraordinary capacity of the Russian for self-indulgence of every kind, or to estimate the fatuous luxury and extravagance of his life. As some one has said, there is only one thing impossible in Russia, and that is to understand the Russians. Your Russian friend, however, is nothing if not logical. In spite of the very thin veneer of European civilisation which covers his skin, he is still somewhat of a fatalist, and views life through Eastern eyes. To him comfort is the highest of considerations, and in his opinion a six weeks' fast, if rigorously observed, is somewhat of a hardship. He must, therefore, go half-way to meet it. And so by committing excess of every description he views the fast which ensues at the end of seven days as a welcome relief, and for the first week at all events there will be little temptation or inclination to break it.

AT THE QUINTA PALAFOX.

CHAPTER II.

THE very next day was made the memorable attack of the French forces on the British entrenched in and about the convent which topped the steep heights of Busaco. The battle raged fiercely; the invaders fought with all their magnificent bravery; but when night fell, though the hill was strewn with dying British and Portuguese as well as with Frenchmen, Masséna's forces were compelled to fall back on Coimbra. However, they kept their hold on the Quinta Palafox, with the intention of turning it into a fortified outpost if the Marshal determined to stay on in Coimbra instead of evacuating it and marching south, as his council advised; and while this military question was under debate the Quinta was turned into a hospital.

When Joaquina heard of the poor souls lying on straw, in want of everything that could alleviate their sufferings, she timidly asked her grandmother if she might not volunteer to help the couple of nuns, requisitioned from the

Convent of Sre Marie Leria in the town, in the nursing.

Doña Elena looked searchingly into the beautiful face. It was the first time Joaquina had taken the initiative. Hitherto she had been passive, and had obeyed when commanded. The old woman realised what this new departure portended. Henceforth her despotic will was liable to be questioned. Instantly she concluded, with her Latin experience of what does awaken a woman, that one thing, and one thing only, was responsible for Joaquina's development. 'You mean,' she said, determined to strike and to spare not, 'that the Colonel de Rubenpré is among the wounded, and that you, a Palafox, wish to continue your acquaintance with this Frenchman?'

Joaquina coloured until her white cheek was changed to scarlet. She felt as if she had been hit by a stinging lash. The next moment she drew herself up. 'I did not know the Colonel

de Rubeaupré was among the wounded,' she replied. 'I trust his is not a serious case.' She turned away. There was little enough privacy in the outhouse, so she retreated into the darkest corner and sat down on what served her at night for a bed. For the moment she hardly thought of what was hidden below that bed; she only sat still, her hands crossed on her lap, her eyes looking straight before her. Joaquina was not only realising herself, but she was realising what her heart had to say to her. Her grandmother's cruel words had disclosed the truth. She knew now exactly what place Louis de Rubeaupré held in her life. When she was quite sure of that she smothered a sigh. '*Madre di Dios*,' she whispered to herself, enlightened by her past experience, 'if my grandmother suspects she will kill him.'

It seemed unlikely enough that an unarmed woman of close on seventy would have a chance of wreaking her vengeance on a French colonel, but that was exactly what did happen.

Marshal Masséna finally decided on the march south; but first, knowing all too well what it would mean to them if his wounded were left to the mercy of the infuriated peasantry, he gave orders that all the sick and maimed were to be conveyed into Coimbra, where he proposed to leave a guard to protect them. The order, of course, applied to the Quinta Palafox as well, and the very man selected to carry out the evacuation from there chanced to be Pierre Toffin.

Perhaps the horrible wickedness of which this man was guilty did not spring up all at once into his mind; maybe the stress and the hurry suggested it; at any rate, in the end he deliberately left Louis de Rubeaupré and Antoine Grandet, the colonel's faithful orderly, to their fate. He forgot them—for De Rubeaupré had been laid in a slit of a room by himself—that was how Pierre Toffin put it.

The last man had hardly marched out of the Quinta when Doña Elena, after peremptorily bidding Joaquina not to stir from the outhouse without leave, was back in her own dwelling. The old woman passed from room to room. There were dirt and disorder wherever she went; there were spaces on the walls from which some marauders had removed pictures that took their fancy; the flowers in the garden were trampled flat to the earth, the trees broken; her silver was all missing, her old pottery broken. She had gone all her dismal round before she came to the courtyard. There were remnants of French uniforms strewn on the pavement; there were with her stick any débris that hindered her passage until she came to the well-head. She rested by it a moment, then bent down within the hood and examined the carving.

'The spring still works,' she said grimly to herself; and as she raised herself and went

towards one of the few windows looking into the square a Frenchman stepped out.

Doña Elena saw him, and smiled very slowly. 'Why do you remain here, Frenchman?' she asked. 'Why do you not hurry to join your comrades before the English General cuts you up again?'

The soldier disregarded the gibe; he looked down from his height of six feet at the small figure facing him. 'My master lies wounded in here,' answered Antoine Grandet. 'I stay to nurse him.'

'And to get your throat cut by the Portuguese, who have no love for such as you!' went on Doña Elena.

'Maybe,' returned Antoine in his usual unmoved way; 'but I shall have nursed the colonel as long as I lived.'

The simple devotion would have moved most women. Doña Elena did not so much as notice it. She only heard the one word colonel.

'What colonel?' she asked quickly. 'Frenchman, who is this master of yours?'

'My master,' replied Antoine, 'is the Colonel de Rubeaupré.'

Perhaps Doña Elena had guessed before she heard. She averted her face and looked back at the well. She made the same observation as she did when her gaze had last rested on it, only this time she changed the form of her speech. 'The spring,' she muttered now, 'must work.' She waited a moment, thinking over what she would do—gloating over what she might do. Then she came along a few steps more. 'Tell your master,' she said to the orderly, 'that Doña Elena is here, and will inform herself of his condition.'

Louis de Rubeaupré still remained in the little room which had been assigned to him when the Quinta was crowded to overflowing. It was so narrow that it would have been called a closet had it not been provided with a window which had two sashes opening on to the courtyard. He was lying on straw, propped up with his own greatcoat for a pillow, his servant's coat serving him for a covering. He was badly wounded. One arm was entirely disabled; there was a bayonet-thrust in his left leg; he was weak from fever; but at the first glance Doña Elena knew that this man, had he but the most elementary attention, would live, not die.

The colonel recognised her as she entered by the window, and so little did he estimate the situation that, as he heard her stick tapping on the round red tiles which composed the floor, a look of relief overspread his face.

'You are the Colonel de Rubeaupré?' began the mistress of the Quinta very smoothly.

Louis answered that that was his name.

'The man who intervened when my granddaughter and I were summoned before one of your subordinates?'

'I am glad to have been of service to the

Doña Joaquina—and to you,' the wounded man answered.

As she heard, Doña Elena marked two things. The first was that this Frenchman referred to her granddaughter by her name; the second was that his mind was evidently so filled with Joaquina that she, Doña Elena, only came into his consideration as an afterthought. She paused a moment, resenting these things and what they implied with all the force of her vehement nature, and then she walked a pace nearer to the straw.

'Monsieur le Colonel,' she announced, 'you will do well to send your servant away.'

'To send my servant away! Why?' exclaimed Louis.

'My people,' answered Doña Elena, 'the men who have worked on the Palafox estates all their lives, as their fathers did before them, will come back now that they dare show their faces. They will creep out from their hiding-places as rabbits steal back to the grass when the fox has passed by. I cannot protect your servant from them, and you know what their wrath and their vengeance may mean. But you can ensure your man's safety.'

'How?' breathed the soldier. He raised himself on one elbow. He looked hard at the black eyes fixed on him. Already he was beginning to have misgivings as to their friendliness.

Doña Elena permitted herself to smile at his disturbed look. 'Assure your man,' she went on, 'before me, that he is to rejoin his regiment, and he may go with his life, provided with a passport from me, since'—

'Since?' thrust in Louis, more and more perplexed.

'Since,' concluded the smooth, slow voice, a voice cruel as ungoverned hatred alone could make it, 'the Colonel Louis de Rubeaupré will be left behind.'

The wounded man heard. All his illusions were gone. He saw that he was face to face with an enemy who was as merciless as she was vindictive. For the moment he did not stop to ask himself why he was so hated; the urgent need to free himself from Doña Elena superseded every other consideration. He pulled himself higher on his good arm. 'What will become of me if I tell my man to go, and he leaves me behind?' he asked, not because he had much doubt, but because he wanted to gain time.

Doña Elena bent down until her face was almost on a level with his. Her sharp old chin was poked out, her thin hands crossed over the knob of her stick. 'You will die, Frenchman,' she announced.

'How?' gasped Louis de Rubeaupré. He was a brave man, and, though the beads came out round his brow, he kept his mouth firm, his glance steady.

Doña Elena waited as if to let the full significance of her decision sink into the Frenchman's

mind; then she went on: 'You must die, Frenchman; but'—

'But?' repeated Louis.

'You shall choose,' rounded off Doña Elena, 'the manner of your end.'

The man who heard her smiled bitterly. 'If I must die,' he blurted out, 'then the precise way in which I leave this world is but of secondary importance.'

'To you maybe,' retorted the old woman; 'but if there were others—one other—involved?'

This time Louis de Rubeaupré was indeed aroused. It was impossible to mistake the sinister significance of Doña Elena's speech. 'What do you mean?' he demanded. 'What can you mean? Who can be involved besides myself?'

'I mean this,' went on the old woman. 'I will give you, as I said, your choice. You can die to-night—your throat will probably be cut, and that of your servant with you; or you can send your servant away, and die as I choose. In the latter case, if you dismiss your man'—

'You forget,' thrust in the colonel, 'I am on the Marshal's staff. It is but likely that when it is known at headquarters that I have been left behind, a patrol will be sent back to bring me in.'

'You,' answered the old woman, 'will provide against that.'

'I!' exclaimed Louis—'I!'

'Even so, you, monsieur,' declared Doña Elena. 'You will send your orderly back to headquarters; you will send word that there are special reasons why you are safe at the Quinta Palafox. You'—sardonically—'can mention that you are in love with Doña Elena's granddaughter, and that the old woman knows it.'

She just waited to mark the effect of her speech, just waited to see this Frenchman start as his secret was alluded to, and then before he could answer she went on: 'You will assure your countrymen that they need have no uneasiness about you; that you would prefer to be nursed here.'

'And,' cried out Louis de Rubeaupré, 'if I refuse to help in my own murder?'

'In that case,' retorted Doña Elena, smiling a very fine smile, 'you will not suffer alone.'

'My servant has done no wrong,' protested Louis, for he saw now what was his true offence. 'Antoine has not dared to lift his eyes to the face of a Portuguese maiden.'

'It is not only your servant who will suffer with you,' went on Doña Elena.

'Who else?' cried out Louis. '*Grand Ciel!* who else?'

The old woman looked into the excited man's face; she saw the large blue eyes dilate; she saw a great, a horrible terror dawn in them.

When she was sure of the fear she laughed

again. 'You have guessed, Frenchman,' she said coldly. 'Unless you consent, Joaquina suffers too.'

'Why?' called out the soldier.

'Has she not smiled on you; has she not

looked back when you looked at her—she, a Palafox?' Doña Elena answered.

'You cannot kill your own granddaughter!' the wounded man expostulated.

(Continued in following section of this part.)

THE LAW AND THE GAMBLER.

By T. C. BRIDGES.

IT is difficult to imagine a racecourse without bookmakers. Yet that is what it has come to in New York, and several other states of the American Union have followed New York's example. The New York anti-betting law was passed in 1908, and, exactly as might have been expected, has practically killed horse-racing. Grandees of the American turf, such as Mr August Belmont and Mr James R. Keene, brought their studs to England; others sent their horses to western states where the laws are not so drastic.

The United States was the first country to prohibit the sale of alcohol, and it has prided itself on being in the forefront of similar social legislation. But so far as gambling is concerned, prohibitory legislation is spreading all over the world, and laws against betting are being framed and put into force in every quarter of the globe.

In the year following the New York legislature's Act, Mr de Villiers brought a similar Bill before the Transvaal Parliament. It went even further than the American law, for it not only prohibited betting on races and all other sports, but was designed to prevent newspapers from publishing betting information prior to races or other sporting events. More than this, racing was to be prohibited altogether except on Saturdays and public holidays, and the totalisator was to be taxed 2 per cent. on its gross takings. This Bill was not passed in its original form; but there is little doubt that within a few years South Africa as a whole will legislate against all forms of gambling.

There is probably no country on earth in which the gambling spirit is stronger than in Australia. In and around Melbourne there was until recently hardly a day in the year without a race-meeting of some kind. On the pony-course there were no fewer than one hundred and fifty-six days of racing annually. Betting on racing became such a notorious evil that some years ago South and Western Australia established the totalisator by law, and gave its control to the legitimate racing-clubs. But gambling in Australia was by no means confined to racing. All kinds of games of chance—'two up,' 'pak-a-pu' (the latter a form of lottery imported by the Chinese)—flourished. There were gaming or 'tote' houses by the score in every large town and in many small ones.

At last, in 1906, the Government of New South Wales took strong action, and shortly afterwards Victoria followed the same example.

The New South Wales measure makes heavy increases in the penalties for breaches of the existing gaming law, and street-betting is defined as betting in 'any enclosed or unenclosed land, not being a house or a racecourse, within any municipal district.' A fine of one hundred pounds is exacted from the occupier of any house used for gambling purposes, and the owner of any such house who has reasonable grounds for suspecting that it is being used for gaming has been given power to evict the occupier at ten days' notice. Moreover, any police-officer who believes that gaming is being carried on in a house is empowered to 'quarantine' that house. The quarantine consists of a notice obtained from the court, which is served on the occupier or posted on the door. After that any person found in the house may be arrested *without warrant* and imprisoned for six months. The same Act limits the number of race-meetings which may be held yearly within forty miles of Sydney or for the same distance around Newcastle. Also, no races may be held on courses less than six furlongs in circumference. The last part of this most stringent measure prohibits newspapers from publishing the odds on any *future* event; though it is still permissible to give the starting price of winners in events reported. This Act has had the most amazing results. It is said that the day before it came into force no fewer than seven thousand people were counted going in and out of gambling-shops in *one* street in Sydney. Next day these houses were deserted, and had their shutters up.

The Victorian Act went even further than that of New South Wales—much too far, most people say. For instance, the police were permitted to arrest a man without a warrant if they so much as heard him make a sixpenny bet with a friend. No odds or advertisements connected with betting might be published at all. The Act was simply prohibition, and was far more drastic than that of the State of New York. It has, we believe, been already considerably modified.

Still more recently—namely, in June 1909—the French Senate passed a law, introduced in the previous April by M. Ruan, Minister of Agriculture, making it a criminal offence publicly to lay odds against horses. This, of course, has banished the bookmaker from the French racecourse. We cannot, however, take it that this piece of legislation originated in any special

consideration for the morals of the public at large. Rather it was designed to protect the State-controlled *pari-mutuel* or totalisator, the takings from which are taxed to a pretty sharp tune.

Still, that there is a growing feeling against gambling in the country of our neighbours across the Channel is proved by the fact that public lotteries have at last been stopped. The last was begun three years ago, the amount being one and three quarter millions, and the final drawing was held on Christmas Eve 1910. Italy still keeps its State lottery, from which it draws a profit of at least a million a year; Prussia has its State lottery; while the Hamburg lottery is perhaps the best known of all. But in other countries lotteries are disappearing. In England the first lottery was drawn at the doors of St Paul's Cathedral in 1569. Early in the last century the State benefited by lotteries to the extent of three hundred and fifty thousand pounds a year. The last British State lottery was drawn on 10th October 1826, and they were finally abolished by law in the year 1836. The last American lottery was the Mississippi State lottery, which had an enormous vogue all over the States. But it, too, was abolished by law nearly twenty years ago.

Roulette and *rouge et noir* were played openly in kursaals all over the Continent until nearly the end of the nineteenth century. Now one must go to a private club or to Monte Carlo to indulge in these forms of gambling. Ostend is a town which may be said to have lived on gambling for very many years; but even there legislation has set its heel on public games of chance. It is some eleven years since it was announced that the Belgian Government intended to legislate against public gaming. The burgomaster and aldermen of Ostend at once declared their intention of resigning in a body rather than undertake the thankless task of settling the inevitable financial difficulties. It was estimated that the cost to the town by the suppression of the gambling clubs would mean the quadrupling of existing taxation. Until quite recently gambling has gone on at Ostend in a furtive sort of fashion; but two years ago a raid was made by the police upon the rooms of the Ostend Literary Society at the Kursaal, and five hundred people were found to be playing *baccarat*. The stakes, amounting to fourteen thousand pounds, were seized; but the men present did not submit tamely, and some of the gendarmes were roughly handled. The raid was due to a peremptory order from the Belgian Minister of Justice.

Quite recently a Bill was introduced into the French Chamber imposing a progressive tax on the profits of casinos and clubs all through the country. Apart from *petits chevaux* and such-like amusements, enormously high play goes on at many smaller clubs. One is known to have made forty thousand pounds in a year merely out

of the percentage of the stakes paid into the *cagnotte* at the commencement of each game. Paris is full of illicit card-rooms. A special section of the police detective department devotes itself to raiding these establishments, which have themselves an elaborate spy system for getting due notice of the arrival of the police. The mere fact of collecting such a tax would, however, appear at once to legalise the gambling which goes on in these clubs and casinos.

The gigantic profits reaped at Monte Carlo have naturally caused many attempts to start another gambling centre of a similar sort. Some years ago a Belgian syndicate applied to the Government of the island of Samos for a gaming concession. The syndicate offered in return to pay a royalty of five thousand pounds a year, increasing to fifty thousand pounds; to build railways and carriage-roads all over the island; to found banks and schools, a theatre and a circus; and to maintain a hospital; also to subsidise a good steamship service and to complete the quays. Samos would have jumped at the offer. The insular Assembly did, but was (perhaps fortunately) unable to obtain the sanction of the Porte.

Another proposed elysium for the gambler was Moresnet, a little town on the Belgian frontier between Aix and Herbestal. In August 1903 a gambling club was actually opened there, and every membership (six hundred in all) was applied for before it opened its doors. Formerly Moresnet was controlled jointly by Belgium and Prussia; but Belgium bought out Prussia. Belgium, after a few months, put a stop to this newest Monte Carlo.

Even in far Alaska the gambling which was until recently universal in all gold-camps has been suppressed by law. But the diggers were too smart for the United States. When the anti-gambling law was proclaimed at Nome the saloon proprietors at once put their heads together and built a casino on the ice outside the three-mile limit, and consequently outside the jurisdiction of the United States courts. This establishment contained gaming-rooms, a saloon, and a dancing-hall, and ran full blast all the winter, the buildings being taken down before the spring thaw.

In this country Parliament has at various times attempted to cope with the gambling evil. The best-known law on the subject is the Gaming Act of 1845, the main provision of which is the prohibition of the recovery of wagers by civil process. In 1892 this Act was amended and strengthened. Of late years the courts have shown a disposition to treat certain bargains in 'futures' and 'options' in produce as gambling transactions, at least in cases where it was clear that the parties concerned did not contemplate actual exchanges or transfer of the properties.

In spite of these and other Acts, and in spite of the fact that wagering on the gigantic scale

common among rich men a generation ago has gone out of fashion, there never was a time when gambling was so prevalent among the masses as it is to-day. Working-men buy newspapers for no other reason than to read the racing intelligence; and kerbstone bookmakers, although they deal in small sums from sixpence up to five or possibly ten shillings, will take from fifty to seventy pounds a day on the occasion of any big race. Some working-men seem to prefer making a shilling by a bet to earning three times that amount by steady work.

The English law prohibiting bookmakers from receiving money before a race anywhere except in the ring drove a number of bookmakers out of England. They first took refuge in Scotland, but in 1874 the extension of Cockburn's Act drove them to Boulogne. In 1891 they were expelled from France, and found a third headquarters in Middelburg or Flushing. There they remained until recently, when once more the law was on their track. Just a year ago a Bill was brought before the Dutch Parliament to prohibit them from carrying on their business in Holland. This caused a tremendous sensation, for there were no fewer than ninety of these bookmakers, and they employed fully five hundred clerks; so that their expulsion was naturally a heavy blow to the towns in which they resided.

While gambling carried to an excess is an evil

which injures all classes, it is very certain that any Act intended to control gambling requires to be very carefully drawn. If it is not, if extremists are allowed to have their way, the inevitable result is that the law is misused by zealots and brought into disrepute. We have a crying example of this sort of thing in the American legislation already mentioned. In many states in the American Union the law permits a policeman to enter a *private* house and arrest any person found playing any game for money. The result is that bridge at ten cents a hundred is equally illegal with poker at an unlimited rise. The legislature of Utah has made itself an object of ridicule to the whole world by enacting a law making the very game of bridge illegal. The penalty is fixed at five years' imprisonment! The limit in absurdity was reached in New York State, when a golfer was arrested on the links at Long Island on a charge of betting half-a-dozen golf-balls on the result of a match with another member.

Severity in anti-gambling legislation reaches its maximum in the Russian districts on the borders of Manchuria. All persons who play cards are liable to arrest. The punishment is one hundred lashes, in addition to being compelled to wear for one month a metal ring around their necks such as convicts wear. Any official convicted of gambling is to be flogged and dismissed the service.

THE MAN AND THE PEACHES.

A TURKISH STORY.

MANY are the fantastic stories related of Abdul Hamid, the ex-Sultan of Turkey, and his attendants forming the once famous palace coterie. The following, however, came to me from a reliable source, and my informant vouched for its authenticity. I must say that I was still incredulous; but, having told the story in company, I was surprised to hear one of my listeners say he knew it to have occurred.

On the European shore of the Bosphorus, not very far from the ex-Sultan's palace, Yildiz Kiosk, lived, some years ago, a certain Ahmed Rushdi Effendi, one of the hundreds of clerks employed at the Sublime Porte.

For twenty years Ahmed Rushdi Effendi's duties had consisted of writing in ornate language an official communication to provincial governors and sub-governors advising them that such and such a consul, or vice-consul, of such and such a great and friendly Power having been granted leave of absence, during such absence his duties would be performed by such and such other person, to whom the official addressed was instructed to extend the usual courtesies and honours due to his office. The wording of this advice never changed year in and year out, excepting as re-

gards the names of the parties concerned; and if, instead of writing the whole by hand each time, a printed form had been used, Ahmed Effendi's labours of twenty years might have been compressed into, let us say, one month.

But this is digressing.

For his quill-driving, or, to be precise, for his reed-driving capacities, Ahmed Effendi was supposed to receive a salary of two hundred piastres (equal to about one pound thirteen shillings and fourpence) per month. If, however, he received this salary six times during the same year he considered himself to be very lucky indeed.

Ahmed Effendi was, compared to many of his colleagues, in quite comfortable circumstances. He had no house-rent to pay, his one wife having brought him as a marriage portion the small house in which they lived, boasting of three rooms and a kitchen, and surrounded by a little garden; and, his duties not being very onerous, all the scribe's leisure time was given to the cultivation of this strip of garden. The whole year round this tiny patch supplied Ahmed and his wife with fruit and vegetables, and on these to a very great extent they managed to subsist.

So that Ahmed Effendi, not being ambitious, was a contented man.

In this peaceful household there was, at intervals of a year, but one discordant note, which rang out with increasing vigour each year during the season when peaches were ripe. The cause of this dissonance was a dwarf peach-tree which grew in Ahmed Effendi's small garden, and which yearly bore some six or eight mammoth peaches. Early in this couple's married life Ahmed Effendi's wife dreamed, as wives will, that her husband would one day attain notoriety, and that the mammoth peaches were, in some inexplicable manner, connected with his good fortune.

Fifty times during the present season, as during twenty previous seasons, Ahmed Effendi's wife had urged her husband to carry the peaches as an offering to their sovereign lord, and on as many occasions had her husband declined to do so, relating to his spouse the whispered tales of doom that had befallen those who happened to come under the baneful influence of the palace. On the one thousand and first occasion a listener might have overheard the following conversation:

'Master, we are simple people; such magnificent peaches are not for the "likes of us," and are not in keeping with our meagre fare. It is thy fate, and do thou carry them, I pray thee, to the palace and present them to the Benefactor of the World.'

'Wife, I have ever told thee that no good comes to those who have relations with the palace; and I, who have always been discreet and avoided intrigue, do not wish now to fall under suspicion.'

'But, oh my lord, think of the recompense that may be ours! What is thy fear? Can evil come of a good action? I implore thee, be guided by me.'

'Slave, I am content with my lot and what fate has given me. It is thy duty to know thy place, and not to try to lead when thou shouldst be content to follow, or ill may come of it.'

And on this occasion, as on one thousand previous occasions, Ahmed said he would never consent; and, as men will, he might have been seen a week later, dressed in his 'Friday best,' approaching the palace gates, carrying a large fancy basket, covered in true Oriental fashion with pink gauze and decorated with coloured ribbons, in which rested seven magnificent peaches, truly fit to present to a king.

On his arrival before the palace gates Ahmed Effendi took his handkerchief and carefully flicked the dust off his shoes, then with the same handkerchief he just as carefully wiped the perspiration off his streaming face, and, summoning all his courage, entered the palace and asked for the Grand Chamberlain I—— Pasha. To this great official Ahmed Effendi stated his mission, and begged him to present to their Imperial

Master the wonderful peaches that had grown in the garden of his humble servant.

The Chamberlain, knowing the sovereign's inordinate fondness for fruit, and hoping that the receipt of this unusual gift might put him into a good humour, when the moment would be opportune to mention a small personal matter on which his heart had long been set, promptly carried the basket of peaches into the presence of the Illuminator of the Universe.

It happened that everything turned out just as the Chamberlain had hoped it would, even to the personal trifle, and the Sultan was so pleased with the gift, and so curious to see this faithful subject who brought something and actually asked for nothing in return, that he commanded the Chamberlain to tell the donor to wait, and as soon as he was at liberty he would like to see him; inwardly registering a vow that he would make him eat one of the peaches in his presence in order to satisfy himself that they were not poisoned. The Chamberlain returned to the nervous Ahmed, and, delivering his master's message, showed him into a large reception-room, where he told him to wait until he should come for him.

It so happened that on this particular day a High Commission was sitting at the palace to investigate several recent cases of bomb-throwing in the city, and the room into which Ahmed Effendi was shown contained no small muster of suspected revolutionaries awaiting their turn to be examined.

Shortly after Ahmed Effendi had been left to his own thoughts another official entered the room, and in curt terms told the mixed crowd that, the preliminary investigation having ended, they were to be taken to the central prison. The room mysteriously filled with armed guards, who began to use gentle persuasion with the butt-end of their rifles.

Ahmed Effendi, who had hitherto kept his stand in a corner unnoticed, was now accosted by one of the guards with 'Hey, fellow! are you waiting to be appointed Grand Vizir?' Ahmed Effendi was at that moment absorbed in his own thoughts, and, to his credit be it said, had no such high aspirations; but, having no answer ready for this remark, he held his peace. His silence, however, had the effect of further exasperating the none too gentle guard, who was quite unaccustomed to such coolness.

'Well, do you take me for your servant awaiting your orders?' roared the impatient adjunct of the law.

'I am the man that brought the peaches,' was the only explanation thought necessary by the timid wielder of the pen.

'Oh yes!' retaliated the now furious guard, 'I have heard that story before, and it is now time for us to be moving;' which remark he accompanied with a vicious kick.

Ahmed Effendi, now thoroughly confused, and at a loss for words, began to splutter further

about 'peaches,' 'the Grand Chamberlain,' and being told to wait; but before he could frame any intelligible sentence a shower of cuffs and kicks rained upon him from half-a-dozen guards who had surrounded him. As he was by nature a weak man, his expostulations were drowned in oaths and torrents of abuse, while he was literally carried off his feet into the courtyard below, jostled into a waiting wagon, and in the company of two guards hurried off, as were the whole motley crowd of suspects, to the central prison. Every attempt made at explanation during the journey was met with a savage blow on the mouth and a command to be silent.

Arrived at the prison—minus his headgear and necktie, both of which had been lost in the struggle, and with the imprints of the soldiers' boots clearly visible on various parts of his anatomy—Ahmed Rushdi Effendi presented a very different appearance to what he had done when he quitted his little homestead not much more than an hour ago. Utterly exhausted, after repeated attempts to explain himself, our worthy scribe was thrown into a cell, with some others, in a condition more dead than alive.

When evening came, and her lord and master had not returned from the palace, Fatima Hanoum, the wife of Ahmed Effendi, was much concerned; and, after passing a watchful night, at daybreak next morning—her husband still being absent—she betook herself to the palace to make inquiries. After several hours of tedious waiting, having no particular business to state, she was successful in seeing the Grand Chamberlain, from whom she learned that such a person as she described had certainly been to the palace yesterday with a basket of peaches; and although he had been instructed to wait His Majesty's pleasure, it was found when he was sought for a little later that he had taken his departure.

One of the palace guards, who had only lately been appointed, and to whom she related her story, stated that he remembered such a man, and, struck by his disconsolate appearance, had spoken to him when he was leaving, and had heard him utter, 'Come again to-morrow! Always "Come again to-morrow!"' Nothing more could she ascertain.

Fatima Hanoum again wended her way homewards, but only to be disappointed in the hope she had entertained that her husband might have returned during her absence. Unable to account for her spouse's non-appearance, she decided to go to the department where she knew her husband sat on an ottoman with his feet curled under him before a 'what-not,' and, using his hand for a pad, wrote the official documents described above. Here she learned nothing but what she knew already—that her husband had left his office as usual on Thursday afternoon, and had not appeared at his customary hour on Saturday morning, after the intervening Friday holiday.

On each of her successive visits, both to the palace and to the Sublime Porte, Fatima Hanoum could obtain no further news of her husband. Only from the affable guard did she learn that, having again addressed the man he took to be her husband, he had this time heard him say, 'For ten years now I have always been told to come again to-morrow! come again to-morrow!' This disposed of her last ray of hope; and, remembering her husband's misgivings of what befell those who came under the suspicion of the palace, she now mourned him as dead.

In the prison where he was confined, Ahmed Effendi soon became known to the other inmates as 'the man of the peaches,' and was looked upon as a harmless monomaniac. Many months thus passed, when one day the bomb-throwers, including Ahmed Rushdi Effendi, were brought before the criminal court for trial.

When the turn came for our innocent friend to be placed on the stand he was asked his name; and the judge, after vainly searching the *dossier* for such a name, asked him further to state what was the affair in connection with which he appeared before him. To this question Ahmed Effendi replied unperturbed, 'The affair of the peaches.'

'Prisoner,' exclaimed the judge, 'your miserable career is well known to the court, and your attempt at jocularities is most ill-timed. You should bless your magnanimous master for giving a scoundrel like you a public trial, when without a doubt you deserved to be hung years ago.'

Ahmed Effendi, who by now had become quite accustomed to the incredulity with which his attempts at explanation were everywhere received, was not at all nonplussed by this outburst of the noble judge, and simply asked that the Grand Chamberlain be called to confirm his story. The judge, who saw rapid promotion for himself if mere chance had enabled him to unearth a plot in which so high an official was involved, immediately acquiesced, and a messenger was despatched to invite the Court Chamberlain to attend, and pending his arrival the sitting was suspended.

The hopes of the judge were, however, short-lived, for on the arrival of the palace dignitary and with the resumption of the trial, instead of that official showing the least concern at the sight of the poor scribe, he burst into loud laughter, and explained to the judge in a few words the arrival of Ahmed Effendi at the palace some months ago with a tray of peaches, and his sudden disappearance, although ordered to wait His Majesty's pleasure.

After this unexpected *dénouement*, Ahmed Effendi was permitted to depart with the Grand Chamberlain, who at once carried him off to the palace, where, on their arrival, after having placed him this time safely in his own private room, the Chamberlain went to explain to the Sultan the cause of the sudden departure of the donor of the peaches a few months earlier.

The Sultan, realising that an unfortunate mistake had been made, instructed his Chamberlain to inform Ahmed Effendi that any wish of his would be fulfilled.

'Well,' said this official on returning to his room, 'His Majesty has ordained that you be recompensed for your disagreeable experience, and you have but to make known your desire.'

'I only ask to be allowed to depart,' answered Ahmed Effendi.

'Nonsense, man,' said the Chamberlain; 'you have been the unfortunate victim of circumstances, and His Most Gracious Majesty wishes to compensate you for the inconvenience you have suffered. You have but to ask to be appointed governor of a province, or'—

'I have no such desire,' interrupted the other. 'I only ask to be given my freedom.'

'Fool!' shouted the Chamberlain, visibly annoyed, and not understanding such modesty, with which he himself was not blessed, 'have you no military ambition? Ask to be made a Field-Marshal; or, if your taste runs in other grooves, ask to be appointed a provincial treasurer or tax-collector.'

'No,' replied Ahmed humbly; 'let me go in peace.'

After they had argued much in this strain, Ahmed Effendi suddenly veered round and said that he would accept not one but three gifts. Their nature, however, he would only consent to name to the Sultan personally. In his resolve he was obdurate; and, unable to obtain any explanation of this volte-face, the Chamberlain began to have his doubts whether Ahmed Effendi's experiences had not slightly affected his reason, and hurried off so to report to his imperial master.

It should here be stated that in Turkey those whose minds are afflicted are considered to have been visited by the Divine hand, and are for this reason treated with a certain awe and respect which is often denied to others who are *compos mentis*.

On hearing the Chamberlain's story, the Sultan, who happened to be interviewing some of his Ministers of State, was as much concerned as his intermediary at Ahmed Effendi's behaviour, and ordered that this original character be at once brought before him. Ahmed Effendi was accordingly ushered into the Sultan's private study, where, in his sorry plight, he never once dared lift his eyes from the ground.

Struck with his humble and abject appearance, the Sultan addressed him in no unkind voice, telling him that he had offered him through his emissary anything his heart might desire, and that he understood Ahmed Effendi wished to make his request personally, to which he was now prepared to listen.

'Sire,' said Ahmed, 'I ask for a hatchet, the sum of two hundred piastres, and a copy of the Koran.'

To a mind accustomed to innuendo and hidden meaning, it is not surprising that this peculiar request visibly affected the Sultan. Could the mention of a hatchet carry some obscure warning? Was the request for a copy of the sacred book meant to convey a censure not at once apparent? But then the two hundred piastres—what connection could there be between this and the other two requests? Perhaps some such questions suggested themselves to the Sultan while he appeared lost in thought.

'Your desire is granted,' said the Sultan after a few moments' reflection, 'but on condition that you explain the meaning of this very singular request.'

'Sire,' replied our hero, 'with the two hundred piastres I shall obtain a divorce from my wife, the original cause of all my trouble; with the hatchet I intend to cut down my peach-tree; and upon the Koran I wish to swear an oath never to enter the palace gates again as long as I live.'

It may be that the grim humour of the situation, or the extenuating circumstances, or even the supposition that his mind had become deranged under the strain he had undergone saved this man from severe punishment for his freedom of speech, as it is stated that he was neither exiled nor decapitated. What actually did become of him I am quite unable to say. He certainly disappeared into obscurity much in the same manner as a meteor which flashes across the heavens is lost in infinite space.

TENOS AT EVENING.

OH Tenos, could I picture thee
As once I saw thee lie,
In all thy dark solemnity,
Against a sunset sky!

The calm, the gentle wreath of smoke
That rose against the hill,
Transfigured forms and shapes that spoke
Of something holier still.

The lonely fane that glowed again,
The upward paths men trod,
The marble stairs like children's prayers
That go straight up to God.

As chalice on the faithful heart
Bestows a draught divine,
Eve can her eucharist impart
To those that love her shrine.

The patchwork lives where motley thrives;
Old shames that blur the view
Drop from us then and leave us men
Who face the world anew.

But 'tis no final goal we reach—
Short respite from the strain;
The morrow brings the call to each
To start the fight again.

OSWALD H. HARDY.

Chambers's Journal

SEVENTH SERIES

THE SPHINX OF THE SOUTH PACIFIC.

By D. W. O. FAGAN.

AMONG all the enigmas of the world's long-past ages, there are perhaps none more inexplicable, and at the same time more interesting, than those of Easter Island, in the South Pacific, belonging to Chili.

Seldom visited, and a thousand miles from anywhere, a mere speck of solid earth set in the wide waste of a vast ocean, the island hides a secret that so far has defied all attempts at elucidation. Crowded into the narrow compass of its thirty miles of circumference is to be found probably a more romantic chapter of the past than it is possible to meet with elsewhere.

First mentioned in history by Captain Davis in 1686, the island was again visited by Captain Cook during his voyage of 1771-76; and it is to the record of the great circumnavigator that we owe the first detailed account of the wonders it contains. Memorials of a forgotten race stand on every hand. Their grim, absolute silence regarding the past challenges investigation, as if to say, 'Come, read me my riddle,' and at the last dismisses the baffled seeker, leaving the secret still unread. The great gray faces, that stare stonily out to the line of unbroken horizon from the terraces of the island slopes, tell us nothing. Speculation and research have alike proved futile. The wonder and the mystery still remain unilluminated; and, beyond the facts apparent to all, the world has practically learnt nothing of Easter Island.

Around the coast the cliffs have been cut into and foundationed to make wide terraces of cyclopean masonry so angled and sloped in perfect conformity to the lie of the surrounding country as to form almost a part of the hills themselves. Even in this age of mechanical science the building of these terraces would be an undertaking of no small difficulty. Many of the stones are large, measuring six feet and upwards in length by four feet square, and must weigh several tons. How they were transported from the distant quarries and raised into position forms yet another of those problems set by the engineers of a prehistoric past to puzzle the men of a later generation. No cement has been used to bind the masonry. The stones, cunningly tenoned and mortised, fit closely together, forming a solid whole that, except for mere surface abrasions, has defied the ravages of time.

No. 116.—VOL. III.

These terraces form the bases on which were set up the colossal statues in groups of four; but many of the statues have fallen or been thrown down. No attempt seems to have been made by the sculptors to portray anything more than the face, the carving always ending at the level of the shoulders. There is no depth to the head of the figure, the stone having been squared off behind the ears. Above the brows, too, the head has been squared and flattened for the reception of the cylindrical circle of red tufa with which each head was crowned. No attempt at frippery of ornamentation mars the simple severity of execution, which in itself is impressive. All the efforts of the original designers have evidently been directed towards the expression on the faces. The type of face is severely intellectual, and bears no trace of the Negroid or Papuan. The nose is fine, and the chin well formed and prominent. But the most noticeable characteristic of all is the look of haughty disdain that the sculptors have succeeded in producing in the imperishable stone. The thin, protuberant lips are curled into an expression of scorn, and the wide-open eyes stare from beneath heavy brows with imperious contempt.

The statues were all so placed that the faces front the sea, the eyes for ever searching questioningly the long horizon of an empty ocean. How many cycles have passed since first they were set up! For how many untold centuries have these stony eyes, day after day, seen the red chariots of the morning rise above the eastern sea-rim, to sink again into the gray of the west, who shall say?

The statues vary in height from four feet to sixty feet, the average height being between sixteen and seventeen feet, and they are of corresponding bulk; but one still lying in the quarry where it was fashioned—the largest that has been measured—is over eighty feet in length. And herein lies much of the mystery of the island—the work those ancient artificers had planned to do was never completed. Upwards of five hundred statues have been found; but scarcely one-third of the number have been erected in the places prepared for them. Many still lie, in various stages of completion, in the quarries beneath the rocks from which they were cut; many more are scattered over the island

[All Rights Reserved.]

FEBRUARY 15, 1913.

slopes, as though their transport from quarry to site had been suddenly interrupted.

The activity with which the work was conducted appears to have been immense. There is much, also, that points to feverish haste. The confusion and want of system apparent in the workings somehow suggest the spur of fear—fear, perhaps, of some epochal cataclysm that, even as they worked, loomed ominous above the workers' heads. Faces outlined in the natural rock of the quarry walls and still uncut, and complete and half-finished images that lie scattered around, indicate the moment when the sculptor flung down his chisel and the workman his tools as the terror fell.

What manner of men were these workers of the dim past? Were they the remnant of some great people that, retreating step by step before impending doom, had sought a last refuge on the island heights? Did they hope by building here a fortress-temple guarded by hundredfold reduplication of their god's features to stay the common peril? What was the cataclysm that swept workers and records alike to destruction, leaving only the cold gray faces with the sneering lips that tell no tale? And, lastly, granting these things, what of the continent of which the island must at one time have formed a part? These things form the riddle of Easter Island.

It is, of course, idle to speculate. Tradition and literature are silent as the stone images themselves; but that the ancient dwellers in Easter Island came of a race already far advanced toward ultimate civilisation is amply proved no less by the stupendous work undertaken than by the genius displayed in its execution. The inhabitants of the present day, of a wretched, low type, and numbering scarcely one hundred, can tell us nothing. 'The stones have been there since the beginning of things.' That is all they know. Will the problem ever be solved? Will the island yield its secret to future research? It seems unlikely.

The problem which is presented here is quite unique in many respects. The archæologist and the ethnologist have in great measure passed it by, or at most have accorded it scant attention. The island is so isolated and difficult of access, of such small importance to the world, and all working data are so entirely absent, that it seems the secret of the great gray faces must remain for all time among the inscrutable mysteries of things.

The craters of two extinct volcanoes have furnished the source from which the stone was quarried. From one has been taken the hard, gray stone of which the images are formed;

the other has supplied the red tufa of the crowns.

As the images and crowns were fashioned and cut on the spot from the natural rock, the subsequent raising of the huge monoliths to the craters' rim, the descent of the mountain-side, and the transport over eight miles of rough country to the sites chosen must have been very difficult and laborious.

Owing to the difficulty presented by the rough and harbourless coast, very few of the images have been shipped from the island. Indeed, the removal of the larger ones would be a costly and hazardous undertaking. Even the smaller ones are heavy and clumsy to handle; and some idea of their weight may be gathered from the fact that one measuring no more than eight feet in height, now standing in the British Museum, weighs more than four tons.

It is somewhat strange that an explorer so markedly observant as Captain Cook should have overlooked, or at least failed to record, the existence on the island of other relics which present another page of the unwritten history of this lost people. About the slopes of one of the four volcanic peaks that form the high ground of the island are many solidly built masses of masonry, formed of huge blocks of stone uncemented together. The structures are long and narrow, unpierced by windows, and have ludicrously small entrances. Several of the buildings—all of which seem to have consisted of one chamber six feet in width by five in height—measure upwards of one hundred feet in length. The floors are strewn with a debris of decaying timber that evidently once formed a lining to the stone walls. The wood, it is true, crumbles at a touch; but on it may still be traced the carved pattern of the ancient decoration. We may conjecture that these buildings were the barracks that housed the hosts of old-time workers.

There are other buildings of which it is more difficult to explain the use—great piles of stonework, with orifices so small as to preclude all possibility of entrance by the investigator who is not equipped with dynamite and boring tools. Apparently these structures also consist of one long chamber.

The walls of the buildings and even the sides of the quarry show traces of a strange hieroglyph, wall-paintings and geometrical designs that point to a picture-writing that hides the secret of the age-old masonry—a writing, to which, alas! we have no key. Will the future bring forth a second Flinders Petrie who shall solve the mystery and wrest the secret from the island Sphinx?

THE SHIP OF SHADOWS.

CHAPTER XVII.—TO THE ROAD.

WE rowed easily but steadily. In the early morning light I tried to make out the features of the shore. There was the suggestion of woods and heughs, here and there a gleam perhaps of a yellow creek, but all as yet blurred and vague in the half-light. Between us and the shore stretched the long sandy fringe of the Stewartry seaboard. The tide was at the flow, and an occasional stroke of the oars was now enough to keep the boat moving; so we drifted pleasantly, resting, waiting for the way. There was scarcely a ripple on the sea, the tide crooning around us, giving the boat a slow, drowsy, cradle-like swing. In the stillness and the sense of security the days and nights on *The Ayrshire Rose* seemed years ago. So I thought as we leaned over the oars and rested. I saw Evan's head nod once or twice; and, watching him, I dozed, and dreamed that I was at home, and that some one was knocking far too early at my room-door.

'I woke with a start to see Evan in the stern, hammering the seat with a stretcher to waken me. We had been asleep for an hour.

'He handed me the spy-glass. "Where are we!"

'I turned round, put up the glass, and in a trice my pulse was at a gallop. For under the glass, like the sudden raising of a theatre's curtain, there leaped forward into vividness a picture that I had carried in my heart throughout all my wanderings, a promontory dark green with woods, rising behind it hills laced with morning mists; a sentinel isle in the gateway of a little estuary.' He pointed westward. 'You can see them all from the cliffs over there—Screel, Bengairn, Balcary Point, and the Isle of Heston. I was within a summer day's tramp of home, and at the sight the glass grew suddenly dim.

'I handed the spy-glass to my comrade with "The sun is in my eyes, Evan!"

'He laid a big, kind hand on my shoulder. "No, laddie; it's your heart's in your eyes. The sun isna fairly awake yet. 'Deed, ye needna be ashamed, for the best men have just a touch o' a woman in them. Man, if yon were the mists on the Cuchullins instead o' them bits o' hillocks, I might pe feelin' the sun in my old blood as well as in my eyes too!"

'A few strokes of the oar brought the boat within fifty yards of the rim of the tide. I knew my bearings, and when her nose touched the sand we quickly planned our last move. We went over the side, waist-deep in the water; and then, dragging her half-a-dozen yards to a little hump of sand, we turned her keel upwards and left her to the will of the rising tide.

'To splash through the shallows to the sands

took us but a moment, and in half-an-hour we were walking briskly under the green arch of a bird-haunted wood that skirts Balcary Bay on the western side. Not a soul was astir at that early hour. In the village of Auchencairn—somnolent enough at broad noon—we heard a clock strike four.

'A couple of miles farther along the road we curled up snugly enough under the lee of a haystack, and slept the sleep of the just. When I woke, instead of the bilge and tar-laden aroma of the cramped fo'c'sle, a cool breeze greeted us. I stretched myself luxuriously, and sat up to discover the miracle of a green field, beyond it glowing uplands, vivid, splendid with the daring bloom of the whins. The breeze carried with it the scent of the hay and the whins, apricot and languorous, and there we sat for half-an-hour, feeling it was good to be in Scotland. But the sun was climbing, and the open road called. We had a wash in a burn, and took the road, Evan whistling alongside me, his beloved concertina under his arm.

'A glimpse of the sea gave us no signs of *The Ayrshire Rose*. We guessed that she would run with the tide somewhere up the Firth, and purposely had struck westward of Auchencairn. Evan's plan was to get to some quiet railway station, and thence unostentatiously push north off the beaten track. I knew my way, and had gone out of my track to see him part of the road.

'We tramped steadily on. Oh! the good brown hills and the windy moors; the white specks of farm-"touns" sprinkled among the tumbled hills; the kind eyes of the lochans, blue from the summer sky! "Tarry here!" cried the peewits. "Tarry here!" A hundred summer voices, a hundred singing burns, greeted us. We covered the road in deep content, our hearts answering the magic bugles of the homeland. We might have been princes coming into our own, with never a care in the world, instead of two shabby sailor-men on tramp, a few pounds in our pockets and the 'fore-the-mast marks on our hands.

"Oh the oak and the ash and the bonny ivy-tree!
They grow sae green in my ain countrie,"

Evan trolled out; but I knew that he was mentally comparing every turn of the road with Skye.

'Bread and cheese and beer at a country inn, where the Galloway *patois* refreshed me almost as much as the provender; then to the road again, through the heart of Girthon, until we came near the railway that skirts Minnigaff, the burliest parish in that burly land.

'On the slant of a road by the Little Water of Fleet, girt about by birch-woods, we halted,

bird-voices from the thickets very loud in the stillness.

"Well, Evan, we've faced all kinds of weather together; but it's come to good-bye," I said, and for the life of me I could not keep a quaver out of my voice. "We'll meet again, I hope."

'He shook his head, looking at me long and kindly. "I doubt it; but if you will pe takin' my advice, it will pe to bide at hame, an' leave the sea an' roamin' alone, for the sea is like a woman—the more ye'll pe givin' yer heart to her, the more she will seek, an' the more she will keep callin', callin' to ye! An' more! A woman whiles grows old, but the sea never, never! It's mysel' that knows. For the truth is that I've lost notion of any roof over my head barrin' the deck. We have a true sayin' in the Gaelic, 'Blue are the hills that are farthest;' an', as like as no', I'll pe leavin' my old bones far enough from Skye. But ye're young, an' maybe in a year or two ye'll pe glad o' the advice o' a lonely old shell-back that never could guide himsel'. Bide ye at hame."

'He gave me an address that might find him, stood for a moment, then wrung my hand, and suddenly started off at a run. He never once looked back, but near the top of the dusty brae he slowed to a walk. Then the concertina broke into "On the Road to Garelloch," and the last I remember of him was his stepping out briskly to the tune, until it died away and he went out of sight down the other side of the hill. I never saw him again.

'As for me, I knew the countryside like my hand. After Evan and I parted, I sauntered leisurely through the Stewartry, making a détour across the Water of Urr, until I struck the main road at the Nine-mile-Bar, and at night-fall, for the first time for a couple of years, heard the ten o'clock bell ring from the old Mid Steeple of Dumfries. This in your ear. I got a cold-storage welcome from my aforesaid respectable relatives; but I took Evan's advice, and have done little roaming since—except in my dreams.

'Sometimes I come to dream here, where the ship lies bleaching. I know it is fantastic; but at times I fancy that the dead bones stir, and I see *The Ayrshire Rose* alive again from truck to water-line. Her sails curve and fill with life. I

can hear the crunch of the seas on her bows, the hoarse call of the watch; and I "sign on" again for a phantom cruise, around me the lost company of *The Ship of Shadows*.'

I give the story from memory, of course; but I do not try to—I cannot—reproduce the distinction in his presentment of it; the undercurrent of sympathy and love of his kind, the restraint and suggestion—the technique, I had almost said, but the word does not chime with his easy fluency, the speaking gestures of his nervous, capable hands, the vividness and ease with which he visualised the scenes for me.

'Man alive!' I said involuntarily, 'why don't you write all this?'

He gave me a quick, grateful look.

'You think it—my telling of it—worth writing?' He shook his head. 'But you forget. Obviously, it wouldn't do for publication. You see, the others concerned in it'—

'Change the names, the setting, the men, the woman, the ships,' I answered.

'You think, then, that it makes—that it is a good story?'

'Without doubt, as you tell it.'

'Thank you!' he said. 'Thank you! Some day, perhaps, I may write it.'

The afternoon was waning, and I rose, with an apology, to go.

'I think I shall linger here. There is a promise of a fine sunset,' he said.

I was curious to know more of him, I own, and I gave him a lead.

'We must meet again. *Au 'voir*.'

'Good-bye. Er—thanks awfully for—for—the cigars,' he replied, shaking hands with me, and the artificial accent of convention so soon after the grim links in his story and the vision of the blood-stained deck grated like a false note, almost giving me a momentary suggestion of its utterance behind a mask.

'Good-bye,' he said.

'Good-bye.'

Nearing home, I looked back from the cliff to the sands, and saw the sun lower, hesitate for a moment like a bather, and then take the water, the long golden ripples etherealising the wreck and the man's solitary figure.

(Continued in following section of this part.)

STAFFORD HOUSE AND ITS MEMORIES.

By SARAH A. TOOLEY, Author of *Royal Palaces and their Memories*.

FOR many years no sale of property has created such widespread interest as that of the lease of Stafford House, recently purchased from the Duke of Sutherland by Sir William Lever.

The stately and historic mansion enshrines some of the finest memories of the Victorian era. There is scarcely a man or woman of note in the

social, political, literary, or artistic world of the period who has not ascended its famous staircase, and many celebrities from abroad have enjoyed its hospitality. Its art treasures outvie those of Buckingham Palace near by, and it is unrivalled as a home of philanthropy. Its noble owners have made it a tradition to lend Stafford

House for the promotion of benevolent work and great causes. There William Lloyd Garrison and Harriet Beecher Stowe pleaded the cause of the American slave, the Earl of Shaftesbury pictured the sad lot of the slaves of labour at home, and Garibaldi voiced Italy's cry for freedom.

'What the future of Stafford House will be,' wrote Lord Ronald Gower in 1883, 'is not easy to guess. In twoscore years or so it reverts to the Crown. It will then probably become the home of one of the numerous princes that the future royal family will have to house.' The reversion to the Crown thus anticipated was postponed by the extension of the lease to the present Duke of Sutherland, which took place a few years ago; and now Sir William Lever holds the fate of the famous mansion in his hands.

Stafford House rears its massive bulk and pillared entrance in the south-west corner of St James's Parish, and seems to dwarf the castellated walls of its neighbour, the dingy old palace of St James's. The house occupies land which has been Crown property since 1532, when Henry the Eighth purchased the manor of St James from a community of Leper Maidens who from Norman times had dwelt in a hospital dedicated to St James the Less, in the then lonely region far removed from the City. Henry the Eighth coveted the demesne which formed so fair a piece of woodland country close to his newly acquired palace of Whitehall. He purchased the manor, razed the hospital to the ground, and on the site where 'leper maydens' had shaken their cups and platters to solicit alms from wayfarers passing their solitary abode he erected the Manor House of St James's, or the House in the Fields. It was designed by Holbein, and eventually became St James's Palace.

The grounds of Stafford House formed part of the fair expanse of fields and woodland which surrounded Henry's manor house. Where the Duchess of Sutherland has held her garden-parties and charity fêtes, bluff King Hal, in jaunty hat and feathers, with a cavalcade of courtiers in white and silver riding in his wake, and horns blowing, went a-maying with Anne Boleyn.

Stafford House was not, however, the first mansion built upon this site. Its forerunner was Berkshire House, the residence of the Earl of Berkshire at the period of the Restoration. The ubiquitous Pepys visited it, and records in his *Diary*, 19th November 1666: 'To Barkeshire House, where my Lord Chancellor hath been ever since the fire.' On the following day he makes the further entry: 'To church, it being Thanksgiving Day for the cessation of the plague. By coach to Barkeshire House, and there did get a very great meeting; the Duke of York being there, and much business done, though not in

proportion to the greatness of the business, and my Lord Chancellor sleeping and snoring the greater part of the time.' It would seem that in the stress and confusion of the time owing to the Plague and the Fire, the Earl of Berkshire had lent his mansion to the Lord Chancellor.

Two years later Berkshire House had been purchased by Charles II., who in April 1668 presented it to the notorious Barbara Villiers, then Countess of Castlemaine, and ultimately Duchess of Cleveland. It proved too large for the lady's use, and she disposed of the mansion, sold the large garden for building plots, and reserving the south-west corner of the estate, erected Cleveland House, named in honour of her new title of Duchess of Cleveland. The name is still perpetuated in Cleveland Court, Cleveland Square, and Cleveland Row, St James's. The memories of this period are associated with this beautiful and reckless woman of Charles's dissolute Court, driving forth in her coach-and-eight, and giving card-parties at which fortunes were lost and won. She retired to Chiswick in her later years; and at her death her title passed to her eldest son, Charles, first Duke of Cleveland, who eventually, in 1722, settled in Cleveland House.

For the next phase in the evolution of Stafford House we pass to the reign of George the Fourth, when the Duke of York became the possessor of Cleveland House, and on its site erected the present Stafford House on a scale of magnificence in keeping with his position as heir to the throne, prompted possibly by the building enterprises of his kingly brother, who was then converting old Buckingham House, a few hundred yards away, into a palace. The Duke of York died in 1827, without entering upon the occupation of his magnificent new mansion.

It is said that the money for building the house was lent to the Duke of York by his friend, the second Marquis of Stafford, afterwards first Duke of Sutherland; but be that as it may, the Marquis of Stafford now became the possessor of the house, and gave it its name.

Disraeli, with his fondness for introducing real people and places into his novels, could not resist the fascination of Stafford House, which was the most talked about house in London when he first entered Parliament, a thin, pale, dark-complexioned young man, with black curls and the dress of a dandy. Later he described it in *Lothair* under the name of Crecy House, 'one of the half-dozen stately structures which our capital can boast.' 'An heir-apparent to the throne in the earlier days of the present dynasty,' he continues, weaving facts into his fiction, 'had resolved to be lodged as became a prince, and had raised, amid gardens which he had diverted from one of the royal parks, an edifice not unworthy of Vicenza in its best days, though on a far more extensive

scale than any pile that favoured city boasts. Before the palace was finished the prince died, and irretrievably in debt. His executors were glad to sell to the trustees of the ancestors of the chief of the house of Brentham [Trentham] the incomplete palace, which ought never to have been commenced.

The novelist goes on to relate that the family which obtained possession of the mansion 'was what is called a lucky family—that is to say, a family with a charm that always attracted and absorbed heiresses; and perhaps the splendour of Crecy House—for it always retained its original title—might have in some degree contributed to fascinate the taste or imagination of the beautiful women who generation after generation brought their bright castles and their broad manors to swell the state and rentals of the family.'

The latter description is particularly applicable to the Marquis of Stafford, the purchaser of Stafford House. His wife, who became known as the duchess-countess, was Countess of Sutherland in her own right, and brought to her husband the vast Sutherlandshire estate, with Dunrobin Castle.

The marquis was high in favour at Court, and the fact that he was established with his richly dowered wife in the late Duke of York's magnificent mansion, close to the abode of the monarch, suggested to William the Fourth that it would be fitting to make the marquis a duke.

The manner in which the title was conferred is related in the *Stafford House Letters*, edited by Lord Ronald Gower. When William the Fourth first mooted the idea of a dukedom, the marquis had some idea of retaining the name of Stafford; but the king said that his sister, the Princess Augusta, had suggested that Sutherland should be the new title, so Duke of Sutherland the Marquis of Stafford became. It had doubtless occurred to the Princess Augusta that as the wife of the marquis was Countess of Sutherland in the peerage of Scotland, the title should be preserved in her husband's dukedom; also the family felt that the title of Sutherland would be 'satisfactory to friends in Scotland, and give umbrage to none.'

William the Fourth likewise settled in bluff, characteristic fashion the title for the new duke's heir, hitherto Lord Gower. At a dinner at the Royal Pavilion, Brighton, on 10th January 1833, the king called out, 'Lord Stafford,' and Lord Gower stepped forward.

'You intend, of course, to be called Stafford?' said the king.

Lord Gower replied that no determination had been arrived at.

'I think you ought to be so,' said the king, 'and I have called you by that title.'

Lord Gower could only acquiesce in the royal command, and became Marquis of Stafford.

The first Duke of Sutherland died in 1833,

six months after his creation; but already he and the duchess-countess had laid the foundations of the magnificent hospitality of Stafford House, which was to reach its zenith under their son, the second duke, and his wife, the Duchess Harriet, Mistress of the Robes to the young Queen Victoria.

The name of the house fluctuated during the foregoing period, and we find it referred to in diaries of the time sometimes as York House and more frequently as Cleveland House. I have before me an early catalogue of the pictures contained in the mansion which is inscribed as *A Catalogue of Pictures belonging to the Marquis of Stafford at Cleveland House*.

The name of Stafford House seems to have been permanently adopted for the mansion when the second Duke of Sutherland and the Duchess Harriet entered upon their reign in 1833. It now begins to figure as one of the most magnificent social centres of London, and became the talk of the town.

Greville thus refers to it in his *Memoirs* for 15th July 1835: 'The night before last there was a great concert on the staircase at Stafford House, the most magnificent assembly I ever saw, and such as I think no crowned head in Europe could display, so grand and picturesque. The appearance of the hall was exactly like one of Paul Veronese's pictures, and only wanted some tapestry to be hung over the balustrades. Such prodigious space, so cool, so blazing with light; everybody was comfortable even; and the concert combined the greatest talents in Europe all together—Grisi, Malibran, Tamburini, Lablache, Rubini, and Ivanhoff. The splendour, the profusion, and the perfect ease of it all were really admirable.'

Such was Stafford House when William the Fourth was king.

It has been estimated that its first noble owners spent at least a quarter of a million on its decoration. It was the last of the great houses to be decorated with the pomp and magnificence of the Louis the Fourteenth period. But, superb as were the gilding and the painting, the house was chiefly remarkable for the art treasures which it contained. The palatial hall and magnificent staircase are surrounded by galleries and saloons where these treasures are lodged. Though some have been dispersed since its palmy days in the early Victorian period, Stafford House remains to-day a palace of art, where the works of Murillo, Titian, Tintoretto, Rubens, Rembrandt, Paul Veronese, Leonardo da Vinci, and Landseer and Gainsborough are to be seen. The picture gallery is one hundred and thirty feet long, and one side is nearly covered by Murillo's two immense paintings of the 'Prodigal Son' and 'Abraham and the Angels.' These were purchased by the second Duke of Sutherland in 1836.

The position and importance of Stafford

House were greatly increased when, on her accession, the young Queen decided to make Buckingham Palace her home. The arid wilderness of sand and building débris which lay between the desolate and derided palace of George the Fourth and Stafford House, on the opposite side of the Mall, now began to blossom like the rose. The roads were made up, the footpaths levelled, and fashionable promenaders thronged the vicinity. All the pomp and circumstance of Court life became focussed about this portion of St James's Park. The Mall was thronged with the equipages of foreign ambassadors and the nobility, and began to look as gay as it did in the days of the Stuarts. Stafford House stood in dignified grandeur overlooking the gay scene; and thither on occasions came the young Queen herself to grace the hospitable mansion of the Mistress of the Robes.

In the recently published *Diary of Queen Victoria's Girlhood* we find the following graphic description of a Stafford House royal dinner-party.

'August 22, 1839,' the Queen writes, 'at 20 m. to 8, I went with Mamma, dear Victoire, Lady Lyttelton, Uncle, my 3 cousins, Lady C. Dundas, Thérésina, and the Lord and Equerry, to Stafford House, where we were received by the Duke and Duchess of Sutherland, and were taken into a pretty drawing-room downstairs, full of fine pictures. Dinner was announced soon; the Duke of Sutherland led me in, and I sat between him and Lord Melbourne to my right. The dining-room downstairs is not large, but pretty; many fine pictures; fine plate. The Duke seemed much better. The House had been up very early; only the Bolton Police Bill; Lord Melbourne, pale and ill, said he was not well, and ate almost nothing. I said to him it was all that fish dinner.'

'After dinner I found my other ladies and gentlemen, Mary Howard and Elizabeth, Evelyn and Caroline in the drawing-room; the Duchess then showed us all the pretty rooms downstairs, and then took us up to see her beautiful bath-room [a great luxury at that time], bedroom, dressing-room, and sitting-room all full of such pretty things and pictures; and then we came downstairs again, and the gentlemen came in. I observed to Lord Melbourne how pretty the room was. He said, "But this is only the Vestibule;" and that upstairs was all the finery. [The State apartments are on the first floor.] We then went upstairs, and the Hall and Staircase, lit up, with a band in it, was really the handsomest thing I ever saw. We sat in the pretty room where the Christening had been; I sat between Victoire and the Duchess, all on chairs; Uncle and my cousins behind us. We remained sitting here for some time, having tea and ice. We then went into the Gallery, which is quite unfinished, to see the effect of some lighting. After that we sat in the room where we lunched last

year; I sat on a large sofa with dear Victoire; and then Lord Melbourne came and sat down there. "This is a beautiful room," said Lord Melbourne; "that Gallery will always be a dingy room," which I denied.'

The young Queen proved right in her judgment, for the completed gallery, as we know it to-day, is certainly not a 'dingy' apartment. "

The Duchess of Sutherland had a very natural wish to purchase the lease of Stafford House and make it a permanent possession of the family, and the girlhood diary of Queen Victoria throws an interesting light on the circumstance. In February 1838 the Queen writes: 'Spoke about the Duchess of Sutherland—her family; Lord Melbourne said she was naturally very proud; spoke about her house, the lease of which she wishes to buy, but which, as it is Crown property, Lord Melbourne said she could not do; he dreaded the time when the Duchess should learn she could not do so; but that he was afraid of writing to her before she received the formal answer from the Treasury. I told him, however, it would be better if he did so, upon which he said, "Then it shall be done."'

The affair passed off without any rift in the lute to disturb the harmony between the young Queen and the first lady of her Court. And if the duchess experienced any ruffled feelings, they must have been mollified when Queen Victoria, going from Buckingham Palace to a Stafford House party, paid the now historic compliment, 'I have come from my house to your palace.'

Stafford House was at the zenith of its fame during the twenty-eight years in which the Duchess Harriet reigned over its destinies. The duchess was a handsome woman of the fair Saxon type, with a gracious mien and commanding presence. Lawrence depicted her in her prime in the portrait which hangs in the ground floor of Stafford House. She was held in great esteem and affection by her royal mistress, was an ardent sympathiser with the Prince Consort in his beneficent schemes and lofty ideals, was a patron of literature, art, and music, the friend of many famous men and women at home and abroad, and a hostess of abounding hospitality. She welcomed guests of all ranks and interests, and lent her house for the furtherance of many humanitarian objects. The duchess was a pattern wife and mother, and combined the domestic virtues of the Court of Victoria with the social graces of a *grande dame* of old Versailles. Rogers poetically described her as the good fairy of a fairy palace. Amongst the outstanding men of her later intimate circle were Tennyson, Gladstone, Wilberforce, and the late Duke of Argyll, her son-in-law. It is no small tribute to the duchess that when Gladstone received the news of her death he wrote: 'I have lost in her, from view, the warmest and dearest friend, surely, that ever man had.'

The wide range of interests which were repre-

sented at Stafford House may be judged from the fact that on one occasion an exhibition of wicker coffins of all sorts and sizes and patterns was held in the garden, *à propos* of the 'earth to earth' theory then much discussed.

The duchess was a sympathiser with Italy and Poland in their struggles for freedom, and with the Abolitionists of America. Amongst the many scenes which took place during her reign at Stafford House the reception given to Harriet Beecher Stowe is outstanding. After the author of *Uncle Tom's Cabin* had pleaded the cause of the slave before an audience at Stafford House, which included some of the most notable people of the day, the duchess took from her arm a gold chain bracelet, and, placing it upon the arm of Harriet Beecher Stowe, said that it was typical of the slaves' fetters which she hoped would soon be broken. Some ten years later Mrs Stowe was able to have the bracelet engraved with the words, 'Abolition of Slavery in the United States of America.'

It is a noticeable coincidence that the glories of Stafford House waned with those of Buckingham Palace. The Duchess Harriet became a widow in the same year as Queen Victoria. Buckingham Palace now lost the bright effulgence of a gay Court and happy family life which had distinguished it throughout the Queen's married life, and became merely the occasional official residence of the sovereign. Stafford House passed to the third Duke of Sutherland;

and, although he and his first duchess continued its traditions of wide hospitality, it lost something of the peculiar *cachet* which was attached to it during the palmy days of the Victorian Court.

Under the present Duke and Duchess of Sutherland the social and philanthropic traditions of Stafford House have been revived. The duchess is well known for her interest in questions of the day, and for her love of literature. She is an author of repute, and delights in the society of people of literary and artistic tastes. Her garden-parties at Stafford House have been remarkable for the men and women of varied interests and conditions gathered together. The cause of philanthropy and social reform has been voiced again and again at Stafford House, and it has played a distinguished part in the festivities of two coronation years. There are few notable visitors to London from other parts of the world, or delegates to congresses and conferences from the overseas dominions and abroad, who do not retain a memory of Stafford House.

In reply to a recent inquiry in the House of Commons as to the future of Stafford House, the Prime Minister, Mr Asquith, replied that the Government had received from Sir William Lever an offer of the remainder of the lease of Stafford House as a gift to the nation, subject to certain conditions. The Government much appreciated the generosity of the offer, and were considering the matter.

AT THE QUINTA PALAFOX.

CHAPTER III.

'I CAN send her to a convent,' Doña Elena answered, 'to a place of penitence where daughters who have forgotten what is due from them are sent in our country. Think how Joaquina will enjoy that! She has no vocation, no inclination to sacrifice and mortification. She is young. The rule is so severe that it implies perpetual hunger, perishing cold in winter, burning heat in summer. Think how she will suffer!'

'But'—began Louis.

Doña Elena silenced him. 'I have decided,' she said; 'I want no argument. My granddaughter must do as I wish. She ought to suffer; she shall suffer as I have described. Who is to prevent it? Her brothers certainly will not, since she has disgraced herself by looking at a Frenchman—unless'—

'Unless?' repeated Louis de Rubeaupré.

'You consent to my alternative.'

'And if I do?' asked Louis slowly.

'Joaquina shall go free.'

'I have only your word,' said the wounded man.

Doña Elena threw up her head. 'Fool!' she retorted, 'do you not know that I was born a Lerios, that I married a Palafox? The oldest

blood in the Peninsula does not lie. I have said that Joaquina shall go free.'

The Frenchman heard. He dropped back on to the straw, and lay with his widely opened eyes upturned, searching the discoloured white-washed ceiling. He was thinking hard. Anyway, it seemed to him that he must die.

'How do you intend to dispose of me?' he demanded.

'If you accede to my proposal?' asked Doña Elena.

'Yes.'

'That,' answered the old woman, 'you will know when you have dismissed your servant.'

Louis de Rubeaupré's eyes returned to the ceiling. He watched a great spider making its way over the surface; he heard the clash of the gate in the wall without. Life was sweet, and he did not want to lay it down. Life, even according to Doña Elena's showing, held the promise of Joaquina if he could but find the way to live. He turned over the situation in his mind. He could see no loophole. And, whatever was to come, he must save Joaquina from a life of misery.

'Come,' said Doña Elena when the spider

was curling itself into a ball close to the crack in the ceiling; 'you keep me waiting, Frenchman.'

It was the supreme moment. Louis de Rubeaupré could save the girl he loved, the servant who had been faithful to him; but he could not save himself. His blue eyes cast one swift glance through the window into the courtyard. He listened again, listened as if the very straining of his ears must bring a French patrol riding up the hill. But he heard nothing. Suddenly he seemed to realise how thick were the walls of the Quinta, how solitary was the situation of the house. Twenty hideous stories, told to him with bated breath since he entered Portugal, sprang into his mind. If only he knew what death he was to die; if he had but his pistol, and could make a sharp, swift end!

He raised himself. Doña Elena's eyes were fixed on him.

'Then,' observed the old woman insultingly, 'since you hesitate, love is not greater than life with a Frenchman.'

'I accept,' cried out Louis, stung by the taunt.

'I accept. Swear to me that Joaquina shall in no way suffer, and then do with me what you will.'

The old woman heard. Not the faintest impulse of pity stirred her; nothing in her hard nature bade her pause. 'You have my word,' she answered. 'Now, when I summon your servant you must give him a message for your General. You must bid him set out at once.'

Louis de Rubeaupré opened his lips to comply. The first time he tried to frame a sentence of acquiescence no sound came.

'Call Antoine,' he managed to say on making a second effort, 'and I will tell him what you will.'

In another moment Antoine Grandet stood by his master. For one instant Louis de Rubeaupré looked up at the great faithful fellow. When Antoine's broad back was turned there would remain but suffering and death. Yet to convey the merest hint of this to the man who would have risked everything for him was to spoil all.

'Antoine,' the colonel began, keeping his voice firm and steady, 'attend to what I have to say; and with Doña Elena to listen, with Doña Elena's glittering eyes fixed on him, he gave the message.

'But, *mon colonel*,' expostulated the soldier, 'I would rather stay with you. You need some one to look after you.'

Louis shook his head. 'You forget,' he returned, 'that I shall be in the hands of this lady.'

Antoine turned about and faced the little old woman. From the height of his extra inches he calmly scrutinised the dark, sharp-featured face. 'I do not like it, *mon colonel*,' he decided as he turned back. '*Fois d'un chien!*' he protested again as he looked still harder into his master's face; 'but if it were Antoine Grandet to command he would not leave his colonel.'

Louis smiled. He put out his hand and clasped the soldier's. 'But, indeed, my friend, you must leave me,' he said.

Grandet drew himself up and brought a reluctant hand to the salute. It was plain to see that he was dissatisfied, perplexed. 'If these are your orders'—he began in a mumble.

'They are my orders,' said Louis de Rubeaupré very slowly, very quietly.

Antoine saluted again. He wheeled about; but as he stood in the window, his big form shutting out the light, nature overcame Louis.

'My faithful friend,' he gasped, 'give me your hand again before you go.'

Antoine turned about so quickly that he was in time to see a quick movement from Doña Elena. She lifted her stick as though she would strike; her face was convulsed with contempt and disdain. But before the honest Breton could even be sure of the rage which was imprinted there she composed her features again.

'Yes,' she said, her tone as smooth as oil, 'come back and shake hands with your master before you leave him to my care.'

Antoine walked out of the Quinta with a slip of paper which Doña Elena assured him would protect him for the next six hours from any Portuguese that he might meet. The soldier knew that it would take him a considerable part of that time to get to the French lines, and yet he had not gone a dozen yards away from the walls surrounding the Quinta when he pulled up. He stood, with the bright sunshine on him, with the landscape smiling before him, and very slowly he raised his great right hand to his beard and began to stroke it.

'*Nom d'un cigar!*' muttered this faithful soul, 'I do not like it. *C'est vrai*, I do not like it.' He waited again; then he turned about. He looked at the line of solid white wall, at the flat roof of the house rising above it. 'I tell you,' he protested for the third time, 'I do not like it.'

With a shake of his shoulders he began to go down the hill. He went on until he came to the well and the iron wheel. Beside that he halted anew. He recollected how his colonel had drawn water, and for whom. He remembered the glitter in Doña Elena's eyes when he left her; he remembered the name that had been on his master's lips time and again when he was unconscious.

'*Sac à papiers!*' swore this faithful soul, 'my name is not Antoine Grandet if I leave my colonel.'

He stood a moment longer, one foot, in a worn regulation-boot, on the stone rim of the well, his chin resting on one hand, the other fingering his pistol. He wondered what he could do, what he had better do. Antoine might not be a very subtle person, but he realised that to present himself openly at the Quinta would do no good at all. If things were as he felt them to be, if some harm were meditated against his master, he must be on the spot, unsuspected, unseen, to circumvent that harm.

It was not for quite a little time, while the sun rose higher and still higher, that a way presented itself. Then, with a sudden joyfulness, Antoine

Grandet slapped his knee. He took his foot off the masonry and set off at once, not down the hill towards Coimbra, but up the rough track as though he would mount to the summit of Busaco.

He was making towards that outhouse, set among the camellia-bushes and the mimosa which backed on to the hill. Everything depended on Joaquina being there and on her grandmother not being there. Antoine, as he stumbled over a boulder, as he slipped on the clayey soil wet with the rain which had poured in torrents after the battle, felt that the girl could not have left the shelter. His master's life hung on the chance of her being there. He went on speedily but warily. He knew that his pass from Doña Elena specified the exact route on which he was to be immune from attack. He was obviously going in the opposite direction, and yet the additional risk never so much as entered his mind. Very soon he reached the outhouse. The door was shut, and he dared not knock. He raised the rough latch and pushed it open.

Joaquina was within. She started up when she saw a man in a French uniform. With an imperative gesture, Antoine bade her be silent. He shut the door, and then advanced towards her; and as he came along he saw that Joaquina recognised him. 'Mademoiselle,' he began, 'I am——'

'You are,' interrupted the girl, a certain eagerness in her tone, 'the servant of Colonel de Rubeaupré. Why have you come here?'

'To beg you to help me,' answered Antoine, going straight to his point.

'How do you wish me to help you?' Joaquina inquired.

'I believe the colonel's life is in danger,' answered the orderly.

'How?' demanded the girl. 'From whom?'

But Antoine hesitated. After all, 'that old woman,' as he called Doña Elena, was this beautiful girl's near relative. The ties of blood might prevail. He might lose everything. The next moment he dared all. 'My master's life is endangered by your grandmother,' he said bluntly.

Joaquina heard. She raised her head as if she were about to protest; then, with her proud chin half-tilted, she paused. One reflection had struck her, had stopped her. What the soldier had said was but too likely to be true if Colonel de Rubeaupré were unprotected and in Doña Elena's hands. 'Where is your master?' she asked breathlessly.

'Lying wounded in the Quinta. He was left behind.'

'Then why are you not with him?' Joaquina flashed out.

The soldier explained, and as Joaquina listened she grew suddenly cold. Her grandmother, Doña Elena de Palafox, who preached undying hatred of the invaders, would never nurse a Frenchman unless she meant to make herself certain that he should not recover.

For one moment—knowing that, realising all it foreshadowed—Joaquina stood overwhelmed with the feeling of her own helplessness. Never had she taken the initiative; never had she opposed her grandmother's iron will. She leaned across the rough table. 'Why did you come to me?' she waived.

'There was no one else,' answered the soldier.

'I can do nothing,' began the girl.

Then Antoine played his trump card. 'Mademoiselle,' he said sturdily, 'if you cannot help my master, no one else can. You know how the colonel saved you, but you do not know what he thought of you. I do.'

'You do!' cried out Joaquina, her face crimson, her voice an indignant protest.

'Yes,' answered Antoine steadily, 'I do. Not because the colonel told me or any man. A Frenchman is a gentleman as much as one of your own *hidalgos*. But when my master was off his head, when he did not know what he was talking about, then he called for you.'

'Called for me?' exclaimed the girl.

'Yes, mademoiselle,' the soldier assured her, 'my master called for you day and night.'

After that Antoine Grandet was silent, and Joaquina was silent too. The time was passing, and yet they both waited.

At length Joaquina sighed heavily. She lifted her head and looked the faithful Breton full in the face. 'My friend,' she said softly to him, 'I do not know how we are going to do it, but somehow we must save your master.'

Antoine put up his hand. 'I am at the orders of mademoiselle,' he told her, ranging himself under her superior powers of invention.

The girl began to rehearse the situation. 'We must get into the Quinta unseen,' she muttered; 'and we must get *him* out without any one knowing.'

'But how, mademoiselle?' put in Antoine, remembering the encircling walls and the heavy locks on the two gates.

Joaquina leaned over to him. She put up her little hand and took hold of the flap of his coat. 'Frenchman,' she whispered impressively, 'French soldier, can I trust you?'

'*Bien sûr!*' returned Antoine with his habitual brief simplicity.

'Frenchman,' went on Joaquina, mindful that she, a Palafox, was betraying the secrets of her house to an enemy, 'there is a secret way into the Quinta.'

'Not by either of the gates?' muttered the soldier.

'Not by either of the gates,' the girl repeated.

'*Grand Ciel!* how, then?' demanded Antoine.

Again Joaquina hesitated. Even with the fate of the man she was about to try to save trembling in the balance, she could not forget that she was going to do that which would shut her out as long as her life lasted from her grandmother's pardon. With a little shudder, with

her face even a paler hue than usual, she went towards the low couch in the corner. Tumbling off the rug, she pulled up the row of planks.

'Come here!' she said over her shoulder to Antoina.

The great bearded giant approached. He

looked down into a dark, round opening, and saw narrow, winding steps. '*Mais, nom de nom!*' he ejaculated, as he realised that this secret way had been there during all the French occupation, and that it had never been found out.

(Continued in following section of this part.)

THE OYSTER-FISHERIES OF THE WATTENMEER.

By GEORGE ADAMS.

ALONG the western coast of Schleswig, from a few miles to the north of Heligoland to the frontiers of Denmark, stretches the Wattenmeer. A fringe of low, sandy islands, limited in area, divides it from the North Sea, and forms a kind of natural breakwater. Between the islands and the mainland is an expanse some ten miles wide by about twenty miles long, consisting largely of stretches of water varying greatly in shape and dimension, dunes, shallows, sandbanks, and channels both swift and sluggish. In a few places islets throw patches of green amid this waste of dark blue and pale yellow, except when wintry fogs blot out everything from sight. Here are the most important oyster-fisheries of Germany. They are the property of the Prussian State, and were leased some years ago to a company. The fishing-banks number fifty-eight, and range from about three acres to some seven hundred acres, covering a total of nearly five thousand acres. The fishing area, however, increases almost every year. Most of the oyster-banks lie on that side of each channel through which the water flows freely at high-tide, thus bringing the oysters a constant supply of nourishment from the North Sea.

The oysters of the Wattenmeer differ widely from those found off Heligoland and the chain of islands extending towards the Dutch border. They are carefully and scientifically cultivated, and are much larger; they have thin shells, and their flavour is similar to that of the Channel 'natives.' In summer each of them produces approximately a million others as spawn, which develop only at a high temperature. At first the spawn is white and milky, then it passes from pale blue to a sort of dark blue, and finally becomes a blackish and granular substance. When cast off it is of the same weight as water, and floats in and out with the tides. After six or seven days its gradually increasing weight causes it to sink. If it falls into mud or on a muddy surface it is lost. In all cases the wastage is enormous, and a couple of marketable oysters obtained from every million of spawn is considered a satisfactory result.

Experience has shown where the spawn generally sinks, and towards the end of spring special beds are prepared. These are composed of oyster-shells, stones, bricks, gutter-tiles, &c., previously dried and covered with lime to give them a rough

surface. The best beds are in channels where the water flows freely and quickly, and brings the most nourishment. Young oysters cannot thrive in such strong currents, as they receive little sustenance, and do not grow so fast; but in the course of time they are transferred to where their growth is accelerated.

At the beginning of every high-tide oysters open to receive whatever food the water brings, and close again during the ebb. Especially when they are young, oysters have many species of enemies. Foremost among these are starfish, which drive their fangs through the open shell and drag out their prey, and the sea-urchins, which bore a hole through the shell and suck out the contents.

The fishing-vessels present a remarkable contrast. Besides paddle-steamers and smacks, they include a variety of craft partially or altogether unlike anything familiar to us; as a rule, they are very wide and rarely draw more than two feet of water. Their crews hail from the neighbouring islands and Schleswig, and earn a hard and precarious livelihood from agriculture when the oyster-fishing is closed. The after-deck of these boats, and particularly of the larger ones, is provided with apparatus resembling two gibbets. The first, close to the stern, is surmounted by from three to six pulleys. In its rear stands the other in front of a corresponding number of windlasses. A rope, ending with a big hook, runs through each pulley and is wound round a windlass. At the end of every rope is a basket made of small iron rings. When the nets are lowered the vessel slackens speed considerably to let them dredge the surface of the beds. Then the contents of the nets are hoisted and emptied on the deck, and the operations are repeated.

When the heaving, struggling mass on deck begins to scatter in all directions, there is revealed a jumble of crabs, crayfish, sea-urchins, sea-anemone, pipefish, starfish, small flounders, and many other denizens of the deep, besides rays' eggs, empty shells, stones, pieces of brick, and oysters of various dimensions.

The incoming boats are immediately boarded by gangs of men provided with huge baskets, into which are thrown the catches. These baskets are hoisted into trucks running on rails and drawn to the sorting-house by horses. The contents of the baskets are divided into four lots:

oysters, other edible fish, 'hurtfuls,' and empty shells, stones, &c. The edible fish are usually the workmen's perquisites; and the 'hurtfuls,' including starfish, sea-urchins, and so forth, are all buried in the sandy land, patches of which become fairly suitable for cultivation after this manuring has been done for a few years. As to the shells, they are reserved for use the following season.

The saleable oysters, when carefully cleaned, are placed in a separate reservoir, and the others are sorted into three sizes. Sizes one and two include those that will be fit for sale in one and two years respectively; the smaller ones fall into size three. To each size are assigned suitable places in the reservoirs, and special kinds of food.

Within sight of the mainland lies Sylt, measuring forty square miles, and therefore the largest German island in the North Sea. Only two-fifths of its surface is suitable for cultivation, the remainder consisting of heath, marshes, dunes, and sandhills. How long this island will retain its present size is doubtful, as for centuries the waves have been eating away its coast, despite the efforts of the Prussian Government to prevent erosion. Its population does not exceed five thousand.

In the north of this long strip of land lies the village of List, the headquarters of the fisheries. Its cluster of huts, inhabited by seventy persons, is perched on the top of an undulating dune

thirty-four mètres in height. Whatever it is or has it owes to the energy and foresight of the authorities at Berlin and of the company holding the monopoly. They have vastly improved the diminutive port, built a landing-pier fifty mètres long, a sorting-house, a packing-house, wash-houses, stables, store-houses, offices, dwellings for the managers, overseers, skippers, and men employed at the reservoirs and dock, besides a large erection containing accommodation for about twenty workmen who have their homes elsewhere and live at List only during the fishing season.

The three reservoirs are well worthy of inspection. They are constructed of iron and asphalt, and each has a capacity of one thousand two hundred cubic mètres. There is a tube one hundred and twenty mètres long, with a diameter of eighty mètres, between the sea and one side of the reservoirs. This tube, which terminates in a sluice, is carried through the dune and feeds a canal surrounding the reservoirs. The sluice is automatic. Other locks connect the canal with the reservoirs. Some of these locks fill the reservoirs, others empty them, and others again clean them. The reservoirs are emptied and refilled at each ebb and flow. Plans are ready for the erection of three additional reservoirs on a same scale.

As the popularity of the Wattenmeer oysters is increasing among the Germans, it is safe to predict a prosperous future for these fisheries.

THE LAST OUTLAW.

AFTER THE '45—A REMINISCENCE OF THE HIGHLAND SURVEY (1870).

By an Old ROYAL ENGINEER, Author of *The Curse of Cluny*.

Because the good old rule
Sufficeth them—the simple plan,
That they should take who have the power,
And they should keep who can.
'*Rob Roy*,' WORDSWORTH.

GLEN QUOICH, the glen to which this story relates, is a part of the Glengarry estates, Inverness-shire, and is really a continuation of Glengarry in its higher reaches, running westward towards Loch Hourn Head. The vast extent of these Highland estates owned by the most powerful chiefs and their clans can hardly be realised by the ordinary Lowlander who has never had the pleasure of visiting these wild, romantic districts. It may be thought by many that the Highland glens are barren and sterile; but such is not the case, for they are in parts well cultivated, and the slopes of many of the mountains are embossed with long stretches of beautiful woodlands. Even in the little glens in the more remote and out-of-the-way places there are fertile oases to be found where the industrious inhabitants find simple and solid comfort unknown to many a Lowland cottar.

Speaking of these vast estates, but ignoring the property of the Duke of Sutherland, the

greatest Scottish landowner, we may take as an example the Breadalbane estates, the property of the Marquis of Breadalbane. They are over one hundred miles long, although not very wide, extending across nearly the whole breadth of Scotland, from the mouth of the Tay on the east to Loch Awe on the west. Altogether he owns four hundred and thirty-eight thousand three hundred and fifty-eight acres. A man able to walk along a tract of his own land stretching as far as the distance between London and Warwick must have enormous power. From this an estimate may be formed of the great area once owned by the proud chief of Glengarry.

Macdonell, chief of Glengarry, possessed the estates extending from near Fort Augustus, Loch Ness, on the east, to the sea at Loch Hourn Head on the west, and a glance at the map will be sufficient to impress upon any one the vast extent of country over which he ruled. This proud chief in days gone by exercised absolute jurisdiction over his fierce and powerful clan. The greater number of the clansmen resided in the more cultivated spots in Glengarry and Glen Quoich, along the fertile banks of Loch Oich,

and along the shores of Loch Lochy to the Cameron or Lochiel country. Others, again, inhabited the little, out-of-the-way glens. These clansmen recognised no law but the will of their chief, who could muster at call upwards of eight hundred claymores, all wielded by efficient warriors whose greatest ambition was to die for him. Whether the cause were right or wrong the clansmen never questioned; the chief's cause was their cause, the chief's king their king.

In the 'troubulous times' of '15 and '45, Glengarry, by his tactics and cautious strategy, managed so far to evade responsibility as to save his estates from forfeiture. His territory in the heart of the Highlands, coupled with the ready support afforded him by all his kindred Macdonald clans, naturally gave him great influence with the more powerful Jacobite chiefs, in whose secrets Glengarry was known to be deeply involved. Taking apparently no active part, the wily chieftain sent his clan in force to the side of Prince Charlie at Culloden, secretly directed by his orders, and under the command of a kinsman, whose loss in case of defeat would be of less importance.

The battle of Culloden was fought on the 16th April 1746. After their defeat the spirit of the clans was broken, and their chiefs had to flee to the Continent for safety. Many had lost their all—name, rank, estates, and fortune. Now the spirit of those stirring times seems best expressed by the minstrels of that day. Nowhere in the annals of any country since the world began can we find a record more beautifully expressed or a more exquisite set of ballads than those written on this fallen cause. These ballads stand alone, a halo of kindly, pathetic, fervent feeling lighting up every word and breathing unswerving devotion; history, ancient or modern, has scarce a parallel that can afford a theme of self-sacrifice so whole-hearted, or call back to the heart and mind an evidence of such stern yet tender adherence to a cause (though sadly and reluctantly admitted) scarce worthy of the ruin and disaster which overwhelmed the defeated chiefs. But, however right or however wrong, it was in the minds of many of the best and purest-hearted men of the day a just and righteous cause.

After Culloden the Highlands continued to be in a more or less troubled state for many years. Numerous bands of Highlanders lived in undisguised hostility to the lawful authority of the Government, being either legally proscribed on the charge of rebellion or having voluntarily disclaimed allegiance to the House of Hanover. The Government, with a wisdom opportune to the moment, wisely conceived the idea of subduing this unrest by turning the evil with which it had to contend into a benefit and a security to the kingdom at large. It was decided to form the clansmen into regiments; and as this could only be done by placing the men of each clan

under their own representative chief or their nominated *daoine-uasals* (or gentlemen of the clan) as officers, it was so arranged. On no other condition would the project have been possible, so far as the consent of the clansmen was concerned. This wise policy was speedily put in operation, and so successfully did it work that it requires, at this time of day, no speech or writing to eulogise the result. The clansmen and their successors, as represented in the Highland regiments both past and present, have immortalised their country's fame by their dauntless courage. Noble and heroic in the cause of king and country, as they were, their deeds are recorded in the fire of their valour and the blood of their kindred clansmen.

Among the military appointments made at this time was that of the chief Alexander Macdonell of Glengarry, who held the rank of colonel in the army, and who was immortalised by Sir Walter Scott in *Waverley* as the gallant Fergus Macivor. He was the chief from whom Sir Walter received his celebrated deerhound Maida. This was the famous Glengarry who died in 1828, and who was recognised by all his countrymen as the last of the chiefs of the ancient mind and manners. He united in his person the head or chieftainship of the two great septs of the clan Dughall or Macdonald—namely, Glengarry and Clanranald—and is said to have lived a century too late. He rode about in full Highland costume, with his eagle-plume in his bonnet, and with shield, pistols, and dirk, his gillies behind him, and his pipers blowing with might and main before him. His love of pomp, his idle retainers, and the law-courts so burdened his estates that after his death his son was obliged to sell them and emigrate to the Colonies. This young chief's parting with his birthright, and the consequent extinction of the old clan ties, with all the endearing, though often arbitrary, institutions, must have caused regret in the minds of some at least of the ancient race. It was the uprooting of the stem which had held together and supported so many branches for generations, with its far-reaching interests; the snapping of the bond of union which had united two of the most powerful and turbulent of the Highland clans—'the extinction of a little sovereignty, and the transfer of the virtue and violence, thus sheltered, from action to memory.'

Practically all the property was sold; the Glen Quoich to the Right Hon. E. Ellice, P.C., chairman of the Hudson Bay Company; the Glengarry portion to the Marquis of Huntly, who sold it to Lord Ward; and the latter again sold it to Mr E. Ellice of Glen Quoich, who built Invergarry House, a beautiful modern mansion, situated near the junction of the river Garry with Loch Oich. It may be interesting to know that although the present proprietor of these vast estates owns practically all, yet the ancient, ruined Glengarry Castle, and the rock on which it

stands, Creagan an Fhithich—that is, the Raven's Little Rock—and the old mausoleum at Killfinan, near Laggan, where the former chiefs of the clan rest, were excluded from the sale, and it is said that this retention of the castle secures the title of Macdonell of Glengarry to the heir-male, or the head of the clan, for ever.

Glengarry or Invergarry Castle, standing on the Raven's Rock, is now a magnificent ruin. The rock rises from the waters of Loch Oich about midway on its western bank. Loch Oich is a sweet inland lake, fringed with birch, ash, and hazel. Its surroundings were in perfect solitude until the formation of the Caledonian Canal; and at a still earlier date, before the military stations of Fort Augustus and Fort William were established, or the Highland military roads were made (1726–1737), must have been a perfect sanctuary. The people were amenable to no laws but those of their chief, who could defy all Government authority when it suited his purpose so to do. Glengarry Castle, like many of the ancient Scottish castles, was a fortified residence. It was burned down by order of the Duke of Cumberland in 1746, after the defeat of the clans at Culloden. Gazing on its ruined towers, the stranger sees in its decay a fitting emblem of the departed glory of the once great and powerful Glengarry chiefs, whose war-cry or slogan was, '*Creagan an Fhithich!*'

At the end of the eighteenth century Glen Quoich was a wild, pastoral country, embosomed in the heart of lofty mountains. Mile after mile could be traversed without the sight of a human habitation, save the hut of a shepherd raised in some nook or cranny, partly sheltered from the winter blasts and storms. The banks of Loch Garry and Loch Quoich are girdled with huge mountains, in winter sear and brown and overspread with withered fern, but in summer covered with rich, luxuriant pasture. These mountains present fine, bold outlines, peaks, cones, and domes towering aloft in solitary grandeur.

In the bend formed in the centre of the waters of Loch Quoich, and within the Glengarry estates boundary—although only a short distance from the loch's southern shore, which is Lochiel's property—is situated a small island named Eilean MhicPhi, or MacPhee's Island. This island, which is less than an acre in extent, and of little or no value beyond being an adornment to the surrounding scenery, came under our notice in connection with its name, for purposes of insertion as a place-name on the Ordnance Survey maps. As the origin and circumstances appertaining to the name were of an interesting character, we have been led, through seeing a copy of an old record referring to it, taken from the *Inverness Courier* of 25th November 1840, 'to tell the story as it was told' to us, being greatly assisted in doing so by the *Courier's* account, which the editor courteously furnished us with.

On this lonely spot, which is as solitary as the heart of hermit or recluse could wish, resided

(1840) a Highlander, old and stern, who bade defiance to all the civil powers, and lived a free denizen of nature. In the early days of the last century Ewen MacPhee, a fine, sprightly, athletic lad, enlisted in a Highland regiment of which the chief Glengarry was colonel. And here we may pause just to say that, although nearly the whole of the Glengarry clansmen bore the patronymic clan-name of Macdonell, there were included as clansmen other adherents, as was well known. For instance, there was a small body who bore the name MacUalrig, said to have been a minor sept of the Clan Choinnich (or Mackenzie clan), who had been compelled to flee from their own country for some terrible act of internecine revenge, and sought sanctuary under the chief of Glengarry. This chief could depend upon his own kindred clansmen (the Macdonells) for carrying out almost any villainy; but when it was an act of more than ordinary treachery and devil's work, he called on the MacUalrigs to execute it, and they never failed him.

Ewen, having joined the army, was led to believe, or was promised, that he would receive speedy preferment. He went through his exercises with correctness and regularity, but promotion came not; so he one day deliberately marched out of the ranks and betook himself to the hills. His retreat being discovered, an armed escort was sent to apprehend him, and by the connivance of Glengarry he was taken, handcuffed, and marched back a prisoner. Ewen's local knowledge of the whole countryside proved of great advantage to him in this sore stress on his freedom. He went quietly with his escort till he came to Stratherrick, where, on their approaching a deep, precipitous ravine, he suddenly rushed from his captors, and, making a tremendous leap over it, escaped. The escort fired after him, but apparently without any effect on the dauntless Highlander. To this day the place is known as Leum an t' Saighdear, or the Soldier's Jump. Ewen dashed his handcuffs against a rock, broke them, and was once more free among the wilds.

He retraced his steps towards Loch Quoich, and established his abode in the little glen of Corrybuie, which is on the south side of the loch and on the estate of Lochiel. It is an out-of-the-world retreat, and here the outlaw lived for many years unmolested, supporting himself by hunting, fishing, and rearing goats, without any one daring to make him afraid or presuming to speak of rent. As a companion was wanted to relieve his solitude, Ewen wooed, won, and ran off with a damsel of fifteen, who eventually bore him five children. At length, however, the law prevailed for a time, and the adventurer was ejected from Corrybuie. He submitted quietly, and took refuge in the little island in Loch Quoich, which he deemed safe and impregnable. He constructed a hut of turf (or divots) and birch-trees, and procured or made a boat to enable him to communicate with the mainland. His goats, about fifty

in number, were quartered upon the neighbouring hills, and his gun and rod supplied his wants in fish and game. Ewen's strong, handsome, and muscular frame, clad in the Highland costume, was embellished with the skean-dhu (or black dirk), without which he never went abroad. In winter the situation of the lonely family must have been awful.

The tenants of the estate treated the outlaw with respect, some from fear of his daring character, others because of his supposed witchcraft or supernatural power, which was thoroughly believed in by the natives of the district. Thus a supply of meal or a sum of money would from time to time find its way to the lonely island, and the heart of the outlaw was made glad for the winter. He personally believed that he possessed a charmed life; but this did not dissuade him from keeping his loaded gun constantly at his bedside during the night, or having his dirk ever ready by day to supply mortal means of defence. As he always went armed and avoided giving offence, he was not molested, although he was well known to the inhabitants; and the fact of his determination not to be taken alive made it a matter of prudence not to attempt his arrest or arouse his sense of danger. On one occasion he was pointed out to a stranger with the incautious remark, 'There he is;,' on which Ewen drew his dirk and attacked and wounded the stranger, a Mackenzie by name.

The few who had intercourse with Ewen represented him as strongly attached to his family, and it is related by the late Dr Carruthers, editor of the *Inverness Courier*, that on the day when he visited the glen one of Ewen's children had died—died in that solitary Patmos which was destitute of neighbourly aid or consolation. Overwhelmed with grief, the old man took his boat and crossed to a shepherd's hut, begging the shepherd to assist him in making a coffin for the dead child, as he could not steady his hand under the blow of the calamity. 'One touch of nature makes the whole world kin,' says Shakespeare. The assistance was freely given. Some birch-staves from an old herring-barrel were formed into a rude coffin, and a day or two afterwards the child was interred in a spot exactly suited to Ewen's taste and character; for the ancient burial-ground used by the simple people of the glen is also situated on an island in another part of the lake. A number of the graveyards of the clans are to be found on such solitary islands, where, under the shadow of the silvery birch,

amid the odours of the wild thyme and bog-myrtle, many a weary heart long ago found its last refuge. 'The poet's thoughts, the warrior's fire, the lover's sighs are sleeping there.'

When in 1840 the new proprietor, the Right Hon. E. Ellice, visited Glen Quoich after purchasing the property, Ewen called upon him like a dutiful vassal of the old feudal time doing homage to his liege lord, and presented some goats'-milk cheese. His terms were simple but decisive. He told Mr Ellice, not that he would pay rent for his island, but that he would not molest the new laird if the new laird did not molest him in his possession! The grizzled aspect, intrepid bearing, and free speech of the old outlaw struck the Englishman with surprise. Ewen instantly became a favourite, and was not for the time being disturbed.

In February 1842, however, he was bereft of his property, which consisted of a flock of sixty goats. These MacPhee had pastured on the farm occupied by Mr Cameron of Corrychoile, near Roy Bridge, Lochaber; and as he had never paid 'grass-mail,' the goats were seized as compensation for the loss sustained by Mr Cameron's sheep. One day, when the outlaw was absent, a party of Mr Cameron's shepherds, armed with guns and sticks, seized and drove off the goats. MacPhee's wife, who knew how to handle a rifle, gave quick pursuit, firing several times upon the party. They fled precipitately, but managed to drive the goats before them, and to secure them in the old castle of Inverloch near Fort William. MacPhee on his return vowed vengeance, and Mr Cameron was fain to pay him for the goats to avert threatened evil. The outlaw was afterwards evicted from his island, as his notions about property were too primitive.

Ewen MacPhee, the last outlaw, was a wild, unconquered Highlander, one of the types of a fierce and hardy race in whose nature strong passions were mingled for good and evil. He lived long and grew gray under the ban of the law. In his later days he was often seen at Fort Augustus and Inverness, but finally lived with his family at Fort William as a peaceful and well-disposed resident; and so he quietly ended his days without fear of being molested by either civil or military authorities. The little island which bears his name, Eilean MhicPhi, and is so recorded on the Ordnance Survey maps, will serve to retain the name of 'The Last Outlaw,' whose story we have endeavoured to tell, long after the incidents relating to it are forgotten.

TRAVELLERS' RISKS.

APART from the actual horror of shipwreck or danger of railway accident, to which only the most nervous give any thought at the time, travel entails a number of minor risks, of

which, however, those who have no taste for it make so much that one might imagine that a man never died in his bed at home. Among the worst diseases that confront the tourist are

those two terrors of the tropics, yellow-fever and malaria; and to both the bird of passage is less subject than the settler, a curious fact that is less known than it should be. Since, however, various mosquitoes have been conclusively convicted of the carriage of both complaints, ordinary precautions in the way of mosquito-screens, besides quinine, should provide effectual protection. Dysentery is another phantom that haunts the wanderer in the lands of the equator, and it likewise may be averted by using only boiled water. So, too, a pith helmet and green umbrella will defeat the evil purpose of the sun, and gaiters may be worn as a safeguard against deadly snakes. There are some lesser risks arising out of climatic conditions, but on these local information is usually forthcoming. The treacherous sunset hour of the Riviera winter is perhaps the most familiar example; but there are others, notably in Australia and California.

Considerable risk is run by the traveller who does not exercise moderation at table; and if the total renunciation of alcohol while he is in the tropics is too much to exact, the extreme latitude in this respect should be a very modest daily allowance. Excessive indulgence in the rich cuisine of otherlands may bring swift retribution to stomachs accustomed to plainer fare, and the wise man, even if he may not always act on it, at any rate bears in mind the sound advice in *Ingoldsby*:

Whatever you do, have your eyes on the joint!
Keep clear of side-dishes.

This was the view of that robust old sportsman Colonel Hawker, who, always with an eye to straight shooting, restricted himself to the simplest of food, a discipline which did not in all cases enhance the pleasure of his travel. Indulgence in tobacco may also be carried to excess, and any rule locally honoured is worth the tourist's regard. Thus he will rarely see any one smoking out of doors in the Russian winter, and he is likely soon to learn the reason from his throat if he flouts the caution of the natives, who have good cause for their self-denial. It is probable, indeed, that the long cardboard mouthpieces provided with Russian cigarettes are intended to protect Russians against themselves by reducing the proportion of tobacco. While, therefore, Russians smoke an enormous number of cigarettes, they do not actually inhale more tobacco-smoke than those who seem to indulge more moderately in other countries.

The other minor risks of travel are less easily defined, and consist in the vague perils which are popularly supposed to invest sudden change from familiar conditions. Such is the moral of one of the *Lettres de Mon Moulin*, in which Daudet relates the pathetic story of the goat of M. Seguin, which, silly creature, snatched its liberty only to be devoured by a wolf. There are always wolves in the traveller's path, but there is no sound reason for his behaving like a goat. It may have been at such pitfalls that Erasmus

hinted darkly when he vowed that it was better to die good than see Jerusalem; but a more convincing estimate of the manifold dangers that hedge the traveller may be gathered from the old Italian adage that the traveller should have a falcon's eyes, an ass's ears, a monkey's face, a merchant's words, a camel's back, a hog's mouth, and the feet of a deer. Perils that call for so tremendous an equipment must be great indeed, and those who have travelled in Italy may perhaps see sweet reason in more than one of these recommendations. Travellers have at all times been watched with apprehension by those they leave behind, and one old writer declares that no man should go abroad without first making his peace with God and satisfying his creditors.

If any one makes much of these risks of travel besides those who know nothing of them, it is the imaginative traveller himself, either in his letters home or in conversation after his return. He is assailed by the same temptation that proved too much for the garrulous *Æneas* before Dido, or the love-smitten *Othello* winning his *Desdemona*. A sympathetic audience makes havoc of his sense of proportion. Every risk is magnified until it fills the picture. With a little help from the imagination and a little disregard of the truth, a man may conjure up in his back-garden dangers quite as alarming as in a tour round the world. Those who have travelled a hundred thousand miles and more without one solitary adventure that could reasonably be described as hazardous know the comfortable commonplace of travel and the paucity of its risks. The insurance companies know these things also, and few charge any additional premium for travel within the boundaries of Europe.

THE MOORLAND.

SING me a song of the moorland wide,
Of the moorland rolling far and free,
Purple and brown in the billowing tide
Of a silent, measureless sea.

Scarred and furrowed by torrent wild,
Bare to the sun and the fierce winds' sweep,
Mists encircling the rocks up-piled,
Fern and bracken climbing the steep;

Home of all wild and wandering things—
Shaggy cattle with startled eyes,
Flash of a sea-gull's gleaming wings,
Mournful plaint of a curlew's cries.

Fragrant moorland with breath like wine,
Far outspread 'neath a northern sky,
When in crowded streets I faint and pine,
In dreams on thy bosom let me lie!

Once again in the heather bloom,
While the laden bees hum drowsily,
There let me sleep till the day of doom,
Till mountain and moorland cease to be!

J. M. KRAUSE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

IN my previous paper, a brief narrative of some impressions of a dash through Canada, I wrote of the great earnestness, the cold severity, the hard and matter-of-fact energy that are displayed everywhere in this wonderful land of opportunity, the like of which in that respect there is not elsewhere on the face of the globe, and never will be again. Now, as a study of a new land and an adapting people, Canada is the most intensely interesting subject conceivable, and all the more for the fact that she is of us, of the Empire, and there is the great problem of her future association with us, one glorious point in regard to this problem having been splendidly demonstrated of late. Now that question of the nature of the future association, or loyalty if you would have the word, seems somehow to come up at almost every new thought, each new impression. Everything that you see and hear as you wander through this country, which is bigger than the United States, and almost as big as Europe, seems to have a bearing on that question of the imperial future. It may be the predisposition of the travelling homelander, or the obsession of the subject, that makes him see almost every object and every action tested for its qualities of or tendencies towards unity or separation; but the fact is there, and the result is that one of an open, unprejudiced, and intelligent mind finds his views and thoughts and feelings upon this subject undergoing a continual process of change. With certain slight halts and recoveries, however, the process for the most part works all one way, and that is from doubts about the absolute and affectionate unity to no shred of doubt at all, but the happiest and most inspiring confidence. For my poor part, having an interest aroused in this question, and applying the test to all that I saw and heard, that was just the progress of the idea. I have already suggested that when you go up into Canada from the United States you are apt to find the change a little chilly to the emotions. With a serviceable sense of patriotism and a comfortable pride of possession, you may feel when your train has passed through Port Huron at night, and gets along towards Toronto, that now you are at home, where everybody will do all things for you, be bright and cheery in

No. 117.—Vol. III.

doing them, and pay a proper deference to such a master homelander, as people do when he travels upon the continent of Europe—but perhaps more so—and not as Americans did in the States, where, welcome as he was, and hospitable as they were, they did not permit him the retention of his special British pride, nor allow him to believe that he was better than any one else, or specially entitled to any more than the ordinary courtesies that the Americans employ for their social and business purposes.

* * *

But at Toronto the earnest Canadian seems to give you to understand that he has neither time nor disposition to talk unless you have business to do with him. His features are generally strong, and the cold and stern demeanour that sits upon them invites no pleasantries. The men are going about their business always. They are pushing their way along, pushing their country along. Seeing the methods and manners of these people, and having watched the thousands 'going through,' as I called it—through to the Far West—Calgary, Edmonton, Bull Moose, Medicine Hat, Prince Rupert, and all the other ascending cities—you begin to feel the process of a second creation going on in this wonderful country, the earth being taken straight from God and worked upon by man with all his most up-to-date appliances. The speed and thoroughness of it all are amazing. Half-a-dozen huts made up Calgary thirty years ago. Ten years later she had a population of only a trifle over four thousand. Now it is about fifty thousand, and Calgary is a modern city with all the proper appurtenances thereof. And the speed of things is quickening all the time with the extra facility that comes from experience. To-day in the train you may ride through virgin woods or along an untouched prairie, and before you have passed through another of your seven ages there may have arisen at such a spot the town hall, the public library, the great streets and the cars thereof, and above all the C.P.R. or G.T.R. depôt which sets the life-blood circulating through the new city. When a railroad flings out a tentacle into another piece of raw Canada, as is being done all the time, cities and industrial centres spring up all about it, and especially at

[All Rights Reserved.]

FEBRUARY 22, 1913.

the terminus, as if by magic. This is the way of a second creation such as there has never been on any other continent. Throughout the Old World the cities and towns have not been made; they have been for the most part the slow growths of hundreds or thousands of years; and in that slow growth and shaping, like the petrifying of some amorphous clay, there has been bred about them a certain cultured way of life, a way of taking things as they come, and getting along with comfort. The difference is that the European seems to live because he has to, and the Canadian because he wants to. When you first consider the temper of the Canadians you must remember these circumstances; and then also you must remember that in the case of comparatively new Canadians they are often people who have come away from the motherland with some feelings of sadness and disappointment in them which have not yet worn away. The motherland failed to feed and keep them as they wished, and they were turned adrift. At this period discernment and justice are not conspicuous in them, and they are not expressing their gratitude to the Crown on every possible occasion. They do not assemble in the streets to sing about the glories of the Empire; they do not hunger for news of the latest London sensations; they just go about their business with straight faces and cold, closed lips. If you were to tell them you came from Liverpool, or Manchester, or Glasgow, or Edinburgh, and were a British subject, they might seem to be no more moved than if you informed them you belonged to Reykjavik. So there is that seeming chilliness everywhere; but these Canadians say little and think deeply, and my Lady of the Snows does not wear her heart upon her sleeve, you will see.

* * *

When you wander about Toronto and consider it in its various features, a new set of views upon this imperial unity question is presented. As I have said, it has been described as more British than Britain and more American than America. Neither statement is correct; certainly not the former. When I was in Quebec or Montreal it was easy enough for me to think of myself as being, if not in England, at some large place in France; but in Toronto all that you can feel is that you are in the capital of Ontario, and that Ontario lies right alongside the states of New York, Ohio, Michigan, Wisconsin, and Minnesota. Toronto is quite American in its ways. It, of all cities over which the Stars and Stripes do not float, is most American in its plan and American in its system. It is, of course, mapped out in blocks and straight lines and rectangles, and cars of American design run along most of its streets. It does not call its streets by numbers; but, when it can avoid doing so, it does not call them streets at all, but simply 'King' or 'Yonge.' It has stores and shops of the American sort, and some goods are displayed

that are declared with no shame to have come from New York. The fashions are set by the great American eastern city. 'Latest fall shapes from New York' I see on hats in the windows; 'Broadway style' I notice on something else. You see there is more in common between New York conditions and those of Toronto than there is between the conditions of London and the Canadian city, and so a readier sympathy in such matters. What New York does in dress is right. (When you go to New York you find it is trying to do what London does, and offering the latest from Piccadilly, so it all comes right in the end!) The clothes are all of American cut and design. Then I see Toronto going in at last for skyscrapers in the New York way. She does not as yet build them at all so high, but the new offices of the C.P.R. rise nearly twenty floors aloft, and that is getting on. In its white enamel the building looks very much like a young New York house. The hotel systems and the foods are to some extent the same as in New York, as indeed they might be expected to be, as they suit the circumstances best. There are the same kind of quick lunch and light refreshment places. There is one of the 'Childs' restaurants such as New York is covered with, and it is open day and night. Some of the newspapers are very American in make-up and manner, though they utter no American thoughts. They have the same bluntness of headline, the same scare sort of way, the same form of expression, and they go in for the same kind of cartoons. You may buy the weekly or Sunday paper with the coloured supplement the same as in New York; in fact, the coloured supplement with pictures of the Tired Tim variety is printed in New York. But much worse than this, the Canadian writers have begun to Americanise the King's English in a way I do not like at all. This is really bad. They are shortening the words, tending to spell them phonetically, and generally making them look queer and improper to an extent that even the Americans do not go. While I was in Toronto I saw some most daring exhibitions of word-reforming. This should not be while Canada is a Dominion. It counts for more than the Canadians may think. We know that they are above all an intensely practical people, and we know also that our English is a queer old language, with hosts of absurdities and inconsistencies grown into it by its long history. But all of the Britains should go along in one British way, and with much respect I would tell the people of Toronto that they are not doing a nice thing in this matter. Then you find that in Toronto they are most enthusiastically playing the American games, and playing them with Americans. I observed that some of their lacrosse clubs were in financial difficulties; but they play baseball in just the American way, with all the American expressions, and they

belong to a league which embraces clubs at the other end of the lake round Buffalo way—American clubs. Of course the money is the same; the dollar bill of Canada and its equivalent in the States are as like as two bills could be. American songs are sung whenever there is singing of a common and impromptu kind to be done; the latest New York and Chicago stories are told; and one day when I walked some way out along King Street I stood for a few moments at a corner to realise the amazing fact that at the kerbstone there was an Italian organ-grinder and his lady with their machine, on which had been pinned a cigarette-box badge of the North-West Mounted Police, and of all the tunes in freedom that these Neapolitans were rattling out, this one was the 'Stars and Stripes for Ever'! Leaving out this ludicrous case, the thoughtful homelander, wandering about the city and making notes, marks all these similarities, these imitations, and he asks if they do not beget or arise from sympathy; and when two countries have so much in common, nearly everything, why—It does not matter; it is not so.

* * *

Watching and thinking, I could not help the feeling that while an impression of America was that it was a country without a soul, it was not so with Canada. There is a difference. Canada is surrounded with the elements that make for a deeper feeling. She has finer scenery; there is more original romance in her bare, new lands. In the States there is beautiful country in the west and in the north-east; but it takes a long time for the oppression of that appallingly monotonous train-journey through the flat, bare middle to be relieved. I remember how, after one long spell of it, I suddenly felt a tingle of pleasure, even though it was dark, as I realised that for the first time for long enough my train was climbing a hill. I looked out and saw the incline. We were at the foot of some of the mountains of the east. Once I sailed all the way down the Hudson River from Albany to New York, and they said I should find it to be at least as grand as the Rhine. It was not, though the river-boat that I sailed on was the finest thing of its kind I had ever seen, with its thick green carpets everywhere, its plants and flowers, its easy-chairs, and its orchestra playing excellent music as the paddle-wheels churned their way along the stream. It was interesting to look up at the Catskill Mountains and see where Rip Van Winkle slept so long and well; and just for a few minutes, after leaving Poughkeepsie, when we turned a bend and passed those splendid hills which, rising up from the edge black and steep, shaded the waters round about—the great 'Storm King,' 'Old Cro Nest,' and 'Breakneck' Mountain, with their history and traditions attached to them—it was really splendid. But one must ride far for tremor of the

emotions caused by scenic wonder in the United States. Canada has far more glory, wild and tame. For an example of the latter, there is Quebec. I shall not forget the Sunday morning when, after a night-journey from Montreal, and a scanty breakfast before eight in the morning at a little French café that was not too inviting in appearance, I climbed up to the heights, tramped over the Plains of Abraham, stood reverently for a moment at the spot where Wolfe died, and then rested in the fresh sunshine on that magnificent promenade, half-way, as one fancied, between the glittering St Lawrence below and the unfecked blue above. A battleship down there on the limpid water was but as a little canoe; away to the left there were hills and islands, and the St Charles bending round the corner. Across on the other side was Levis; and from there, and behind me, and all about, there arose in an otherwise silent world the sweet chiming of Sunday bells from, as it seemed, a hundred towers. The silver music suited the scene and the time. It was the most wonderful, noble, peaceful view of its kind that I had ever looked upon. I drank in the glory of Quebec, and I felt one happiness that had not been mine for a long season.

* * *

Niagara is of the States and the Dominion. By gentle hints kind people tried to prepare me for a disappointment. The Niagara Falls have been a name with us all since our cradle-days. They were surely so wonderful that they could hardly be real. One friend told me that he went to the Falls every year as he would go to pay a great homage to Nature, and that he was more awe-stricken every time—that he was much more so the third time than the first. People would put it that way. So I curbed expectancy when I approached the Falls in the most desirable way, by taking steamboat across Lake Ontario, on the bosom of which we were soon out of sight of land. Entering the Niagara River, we hitched up and went ashore at Lewiston, and then had the car-ride which, with that along the Riviera cliffs from Nice to Mentone, ranks as the finest in the world. Up the great gorge we sped at the water's level almost all the way; soon we were at the whirlpool, and then there, in the far distance, silent, seeming as if they were illuminated by a heavenly light, and with a filmy vapour hanging about them, were the torrents that are a wonder of the world. The wild water of the whirlpool, curling and raging as indeed to suggest the angry mood, and those sublime Falls in the distance, made an ineffaceable first impression, and one cared little about what followed. I elected to be one of the tiny minority of visitors to the place who bid their nerves be still, and, stripping themselves of all clothing at an appointed place, and then donning some rough flannel vestments, descend the Biddle

Stairway with a guide, and take the greatest shower-bath in the world. On arriving at the base of the Falls, with the American flood on the right and the Horseshoe on the left, and, as we are told, a little matter of a hundred million tons of water tumbling over these precipices every hour, the object is to pass along the rickety bridge in front of the Central Fall just by, and then round it and through the Cave of the Winds, between the fall and the rock behind it. Timidly, falteringly, with the guide only with me, I step along the bridge and stand before the Fall, which then beats out a blinding spray, and the bath begins. Nothing can be seen save at fitful intervals of bravery, when for an instant the eyes are opened and shut down again by the water almost with a click. Nothing can be heard but the tremendous roar. The guide comes close and screams, and as in a distant whisper he is heard to recommend that the soaking flannels be taken off and the bare body be given to the beating waters. The spray whirls and whistles about. It is like a hundred shower-baths in one—no, a thousand, ten thousand. It is glorious, heavenly, and yet fearful. Presently the oil-skinned leader shrieks his whisper to come along. He and I are there alone with the rushing Fall. He pulls at my hand, we slide along the rickety planks, and creep under the mighty cataract, between it and the cliff. We are then, meek and helpless almost, in the Cave of the Winds. The roar is louder. Now the back of the Fall showers itself against me. It is splendid, but terrible. One feels so very lonesome. We get through at last. The spray still dashes hard against us, but we have got so far from the tumbling water that we can see and realise. And then some thoughts inevitably arise upon the greatness and the power, and yet the beautiful gentleness, of Nature. There like a great kind lion she toys with a puny little kitten, almost caressing him. Did she but disturb the torrent in the least from its settled position, he would be crushed to an awful death; but she is constant, reliable, and he moves away with awe and wonder.

* * *

Yet I should not have told this commonplace story of a visit to such an old sight as the Niagara Falls. I had had it in mind to get quickly past the Falls to tell of a trifling incident, which was in its way significant, that happened on the homeward journey that night. Darkness fell on the lake soon after we left Lewiston, and no moon arose; so the *Chippewa* (half-full as she was with baskets of peaches which she had taken aboard, a glut of the fruit having happened at the farms and orchards) paddled her way through blackness, and I muffled a coat around me and sat on deck with feet up on the rails like many others, and fell to meditation. It was a place and time and situation to think of

home. Two young girls from Toronto were on deck-seats on my left, and they began talking animatedly to each other about their domestic and other affairs. One explained the circumstances of a marvellously rapid change of residence by her family, the difficulties of it, and the excellent manner in which all inconveniences were overcome. It was a story that would hearten and encourage a flitting Londoner on quarter-day. They talked of men in whom they were interested, and then of a royal princess at home in England, though they had never seen England. They showed knowledge of the kingly set, and whispered appreciatively of homely and domestic qualities as features of the highest life. They kept on about the princess; it seemed a topic that they liked. They disputed concerning an incident in her history, and about a feature of her appearance. They continually used the word 'princess,' and then it suddenly dawned on me that I had not heard that word all the time I was in the United States—never since I left England. It did not much matter, but it was curious. So the princess mattered to these Toronto girls. There was something here—an Empire with bonds.

* * *

I must end this story of impressions. But as you linger longer in Canada you realise more and more that the Canadian, as I have said, does not wear his heart on his sleeve; that he is a severe, earnest, strong, silent man who is always going about his business. In the material sense he knows that he can make life very well worth living in a land that abounds in richness, and that is what he is going to do. But he feels the bond, and is a great, true, loyal colonist, as we have lately seen. Some time after I appreciated him the full truth was demonstrated. I was at Montreal on an occasion that was unique. I had once met Sir Wilfrid Laurier in London, and had some interesting talk with him on expanding Canada. Here I had the satisfaction of meeting the new Prime Minister, the great Canadian who has succeeded him. Mr Borden is a very different type of man. There is not that fine delicacy about him that hangs upon Sir Wilfrid; he seems more of the strong, silent, resourceful British Canadian I have talked about. He had then only just come back from his visit to England, where he had been settling those splendid navy schemes. Here at Montreal he was to make his first great speech on his return, and explain things to the Canadians. I went into the big hall of the Windsor Hotel to listen to it, and it was not a thing to forget. That meeting of Canadians did not look at all like a political meeting at home. It was a much more impressive gathering, all the people thoughtful, and for long unemotional. They listened eagerly to what Mr Borden had to say, as his strong voice went rolling through

the hall. He made pictures of empire, spoke of duties, interests; and now and then, when towards the end the emotions of the listeners were stirred, and they were given to imagine the big mother and her scattered children, and

the enduring parental and filial sympathy, some great, wild cheers rang up to the roof, such hot shouts from the heart as one seldom hears. Then, indeed, one understood that Canada was all right.

THE SHIP OF SHADOWS.

CHAPTER XVIII.—PHILISTINE AND ARCADIAN.

THAT evening Hugh and I played 'a hundred up' at billiards. I lost. I am the better player; but I lack concentration, which is to say that I am the worse player. After the game he and I smoked by the snug bay-window, in the after-dinner peace that comes from a day in the open, good digestion, and a good cigar.

'You ought to have beaten me, Frank; but you asked "Is this my ball?" too often. Your wits were wool-gathering,' said Hugh with complacency.

'I was thinking about a story that I've heard,' I replied, for the wreck of *The Ayrshire Rose* had been in my mind the whole evening.

'Must keep your mind on the game. It's half—it's the whole battle in everything. (By the way, that reminds me that I've an accursed "memorial" to read to-night.) As I was saying, concentration of purpose—one's mind on the game.'

He never could resist an opening for giving me a word in season—and out of season, for that matter.

'It depends on the game, doesn't it?' said I. I was in the mood for arguing on any side.

'You mean?'

'That some games aren't worth the candle; that the happy selection of a career is half the battle; that industry and concentration are of little use to a man who is chained to work that he is temperamentally unfitted for. Genius'—

He took the bait without noticing that I dangled it. 'Means a transcendent capacity for taking trouble,' came the triumphant platitude.

'Which is one of the stupidest and falsest generalities ever written!'

He stared at me.

'I quoted from Carlyle,' he said with an air of finality.

'I don't care. The phrase is base metal, if it were Socrates's or Shakespeare's. "Talent does what it can, genius what it must," rings clearer. No amount of argument will convince me that all the pains a thoroughbred takes in the plough will make him do his work other than sulkily and badly, if indeed he'll do it at all.'

'Then let him starve! Man, the scores of good fellows that I've known to go under, apparently mysteriously, really through sheer lack of concentration—men that you knew.'

He named half-a-dozen. I mentally recalled them. 'Yes,' I said,

'most of them men of intense vitality and imagination.'

He rushed at the word 'imagination' like a pike.

'There you are! Imagination is your King Charles's head, Frank! Its possession, real or fancied, is often an excuse for a pose ending in loafing. In nine cases out of ten it's a positive hindrance to success.'

'Yes. The breed that would have sent Keats back to his gallipots—the ruck of the world—often murders its teachers. Imagination might be a hindrance if the doom of a man endowed with it happened to be the career, say, of a pork-butcher or a cheesemonger. These are respectable, even necessary, occupations; but their spur is the huckster sense, the hope of this world's gear.'

'But some one must do what you are pleased to call the huckster-work of this world,' he said with a touch of crossness.

'Of course. I don't disparage them. They are probably pleased with themselves, for Providence has arranged that they don't know that, compared with the artist in anything, they are merely gropers in the gutter for bawbees! Art may be—is a merciless master, demanding the royal service of a man's life. But the big fact remains. Not the least reward of the creative artist—the man who gives this royal service, laughing at all temptations and compromises—is that his is the cleanest of all pursuits, the one that works least injury to one's neighbours. Imagination is the salt of a sordid world. No man who ever benefited the world has not blessed it. It makes life possible. It—it's vision, man! Now, an you love me, don't say, "Imphm!"'

'I won't! But you're off on your hobby, and I sha'n't gallop after you!' laughed Hugh. Then he finished, a little irrelevantly, 'Still, the fact remains. Life's a grim syllogism. If a man will not work, neither shall he eat. Whatsoever a man findeth to do—don't y' know?'

'Yes. The pitiless fact is that so many find their hands trying to do the wrong work. However, I must be off to-morrow, and we may not meet for years. Let's change the subject, old man.'

He nodded acquiescence, and then asked, 'What was the story you were thinking of when we were playing billiards, Frank?'

'One I heard to-day. Do you remember, I wonder, a morning fifteen years ago when you

went fishing, and left me behind because of the weather—the morning a schooner with no one on board took the sands?’

‘I remember about the schooner. Her bones are still lying out there.’

‘I was on board the wreck of her this afternoon, and heard her story. It interested me vastly, especially as I got it from the only man who knows it.’

Hugh looked at me. ‘What’s that? The only one! You may have chanced on some one who was able to give you a few details; but, bless my soul! the story is fairly well known. To my inartistic mind it’s commonplace. But, then, I’m not an artist in anything except, I hope, salmon flies.’

‘Commonplace!’ I repeated. I was surprised, and I suppose I looked it, for he seemed puzzled. ‘I thought it anything but commonplace. The whole thing—the collision, the fight with the sea, the two men and the woman, and the end. Heavens! it is tragedy.’

‘You must be dreaming, Frank. I *know* the schooner’s story.’

‘So do I!’ I said with some acerbity.

‘Let me hear the outline of it, will you? and we’ll compare notes,’ he said after staring at me for a moment.

Nothing loath, I gave him a skeleton narrative of the voyages of *The Berwick Law* and *The Ayrshire Rose*. He listened judicially, without uttering a word, until I stopped.

‘Now, who on earth could have stuffed you with all that? You’ve been badly had, old son.’

‘Had! What do you mean?’ I faltered.

‘What I say. The schooner’s real story was the vulgar one of a swindling master who stole her on a voyage abroad, changed her name, and sold the cargo somewhere on the English coast. He and his mate, his accomplice in the theft, paid off the hands, and the two rascals sailed her up the Irish Sea. They left the ship in a small boat, and landed somewhere or other on the Solway seaboard. I know the yarn, for I was consulted in a similar case of barratry a year or two ago, and got professional access to the papers in *The Ayrshire Rose* business through one of the Advocate-Deputes.’

‘There—there *must* be some mistake,’ I said feebly.

‘Yes! The mistake is that you have knocked up against rather a useful liar, that’s all! Why, the skipper and the mate were caught afterwards. They pleaded guilty, and did appropriate “time.” What did you pay this Munchausen for unfolding his wonders of the deep, may I ask?’

‘Not a sou. I shrank from the idea. The man was poorly dressed, but there was a—a—you know—a—something about him. Then he knew books—and all that—better than I do, and tried not to show it.’ I described him as best I could, and added that I rather thought that he lived near the village.

‘I don’t know him, and I can’t say that I’m sorry. What beats me is this,’ said Hugh: ‘why should a man waste his time telling you “hair-breadth ‘scapes and moving accidents” if it wasn’t for money?’

‘It wasn’t for money, I’m sure, Hugh. I *couldn’t* have offered him money.’

‘Well, I give it up. Perhaps you’ll admit that this at least is an instance of imagination running to seed.’ He dismissed the subject with a shrug of his shoulders.

‘P’raps,’ I said absently. I was in no humour now for a discussion. The thing was inexplicable. Had I been dreaming? Trinidad—Saint Pierre—Lowden at the helm, revolver in hand—the two men bringing the schooner up the Solway! I walked across the room to the fireplace, where I smoked in morose silence.

On the chimneypiece were some of Hugh’s belongings—a silver trophy or two won at golf or billiards; two or three good sporting prints; in the centre a photograph of a group of youngsters in flannels, on the margin the arms of an old Scottish school. I looked at it idly. Next moment I was hurrying with it into the light at the table.

‘Here, Hugh!’ I called. In the centre of the photograph, sitting down, was a youngster, a shy smile on his boyish face. ‘That’s him!’ I said, in the excitement of my find as heedless of grammar as the monks in ‘The Jackdaw of Rheims.’ ‘That’s the man I met to-day at the wreck!’

Hugh looked at the photograph.

‘*Bosh!* That’s Jim Lennox—“Proxime” Jim. Yes, “Proxime” Jim! It can’t be, Frank!’

There was no mistaking the face. I was positive about it, and I said so.

‘Extraordinary! You must be wrong, misled probably by a chance likeness. The photo is the school eleven, years old, of course. True, I’ve lost sight of “Proxime” Jim. He was a shy, sensitive little chap. Clever as they make ‘em! Very straight chap, too! I can’t imagine him sitting solemnly lying to you for a summer afternoon.’

I took another look at the photograph.

‘I don’t think I’m wrong. Let me hear about the man! Why “Proxime” Jim?’

‘*Proxime accessit*, y’know. He *very nearly* did things! But a brilliant man. He was “proxime” in old Mac’s class, and “proxime” in this, that, and the other class. The name “Proxime” stuck to him. Good man all round! In the end he went to Oxford. He left suddenly, I heard, without taking his degree, although he promised well. I haven’t heard of him for years. No, this isn’t the Sir John de Maundeville you met to-day. However, it isn’t worth bothering about. Now, I must buckle to my “papers.” Sorry.’ He rose and went into his sanctum, leaving me to ruffled and conflicting thoughts.

After all, the fault was my own if I chose to listen to and believe a mere stranger! As Hugh said, the futility of it was inexplicable. *Cui bono?* But I recalled the man's frankness, his gestures, his complete immersion in his story, the beads of sweat on his brow as he told it. I

looked at the photograph again, and again the likeness challenged me.

For once I did the obvious and practical thing. I went quietly out and sought the road to the village.

(Continued next month.)

'TWIXT GUINEA COAST AND TIMBUCTOO.

By Captain C. E. COOKSON.

HALF-WAY along the old Slave Coast, facing south toward the Gulf of Guinea, stands Cape Coast Castle. Thence a winding bush-path leads northward, which in the days of Prempeh, 'King of All the Ashantis,' was the principal route to Coomassie, his capital, tucked away amidst many thousand square miles of primeval forest. The old Cape Coast road is now little used, for a railway has been built from the modern port of Seccondee, and Coomassie is separated from the coast by eight hours only, instead of at least ten days as formerly. A march of seven or eight days from Coomassie takes one beyond the northern limit of hills and forest to a fringe of flat orchard country, gradually merging into the open plains and pasture-land which spread right away to the Upper Niger valley. Here was an ideal hunting-ground for mounted slave-raiders, such as Barbatu and the Mandingo chieftain Samory. The latter did, in fact, establish an 'empire' a few days' march only from Timbuctoo, and struck terror into the hearts of the simple-minded Negroid tribes of that region up to the very borders of Ashanti, until himself hunted down by French and British troops in 1897-98. The scene of his ravages was then divided up into protectorates under French and British rule, one of which has lately been incorporated into the Gold Coast Colony, under the name of the Northern Territories.

Though in point of actual distance the greater part of the Northern Territories is nearer to the coast than to the arch of the Upper Niger where stands Timbuctoo, their physical characteristics and inhabitants are similar to those of the neighbouring French colony of Upper Senegal and Niger, and essentially different from those of Ashanti to the south. Moreover, owing in some measure to the dense forest and almost precipitous hills of the Ashanti highlands, communication with the coast is very incomplete. This difficulty is well illustrated by the fact that the Gold Coast hinterland had not been visited by a Governor for five years previous to 1912, when Mr Thorburn undertook a three months' journey therein—and I had the honour of accompanying him as extra A.D.C.—the first complete tour of the country made by any British official.

Not the least interesting of our experiences was the visit to Coomassie *en route*, that delightful peep into the somewhat monotonous forest of

Ashanti, and the later voyage down two hundred miles of river, where the rapids, no respecter of persons, seemed to take a particular pleasure in tossing from rock to rock the Governor's own 'dug-out.' Ashanti, however, has found many chroniclers; and the canoe-journey, novel enough as far as we were concerned, was probably not different from one over many a better-known waterway than the Volta; so the following study is confined to the comparatively little known hinterland.

In the southern province of the Northern Territories the monster trees which lend such grandeur to Ashanti scenery give place to diminutives dotting a portion of the elevated plain—the chief characteristic of the whole of the Northern Territories—and impeding the view without offering any obstacle to cross-country travel. Here and there are patches of open country, while the silk-cotton tree, or less frequently the coco-nut, affords an occasional landmark. In the northern provinces grass-land and open plains are more general, and moderately wooded or orchard country exists only in the neighbourhood of river-beds. A marked feature of the whole country is the Upper Volta River, displaying itself like a lob-sided candelabra, with the White Volta as a central stick, the Black Volta its left branch, and the little Dakar tributary on the right struggling bravely to keep the balance. During the rainy season, lasting four or five months, the twin Voltas and their tributaries are raging torrents; but for several months of the year the former, though broad, are shallow and sluggish, while the latter are dry or at best a mere series of pools. During this dry season the Northern Territories as a whole are a parched and desolate region, where the dull, flat outlook is only relieved by an occasional kopje or native village. A marked exception, however, is to be found in the Bawku district, forming a wedge between French and German colonies in the extreme north-east of British territory. Here the landscape is relieved by undulating ground, intersected by the valleys of several tributaries of the Volta, which, though dry in hot weather, still leave vivid patches of green here and there, while some hills to the north afford a background all the more pleasing because it is exceptional in this country.

Owing to the tsetse fly which infects the bush

and is so fatal to horseflesh, ponies cannot be kept either in Ashanti or the coast districts of the Gold Coast, except at Coomassie itself and at Accra, where large clearances have been made. In the Northern Territories, however, many of the native chiefs have large mounted retinues, and a hammock slung on a pole and borne by four men, the conveyance commonly used in bush travelling, is seldom seen.

The natives of the Northern Territories live mostly in round mud huts, with flat roofs also of mud. The villages are divided into compounds, each belonging to one family, and consisting of a number of huts connected together by a mud rampart. In Bole district, however, lying to the south-west, and bordering on Ashanti, the huts are square shelters, with the inner side open, as in Ashanti compounds. Moreover, in Bole itself, where the fear of the slave-raider still haunts the native imagination, the division between the compounds is scarcely perceptible, and the whole village has the appearance of a large, square mud fort, for the ramparts are particularly high. On the other hand, the natives of Bawku and other more flourishing districts have begun to build their huts with conical grass roofs, formerly tabooed through fear of the raider's torch. A feature of nearly every compound in the northern districts is the family granary, a tall, narrow building with conical roof rising above the huts and rampart which surround it.

Shea-butter, the chief export of the Northern Territories, used as a lubricant, is the fruit of a wild tree very common in the districts immediately north of Ashanti. The native condiment called *dawa-dawa* is the product of another small tree, which it is the custom to farm out at a yearly rent of four shillings. The staple food of the people is guinea-corn, which is cultivated and stored with a thrift quite exceptional amongst West African natives. In some parts there are yam-fields; but the yam appears to be an importation from the coast, where yams and plantains are the staple food. Hitherto the strict prohibition of all kinds of alcohol in the Northern Territories has protected the native from the evil effects which usually follow the introduction of spirits to a primitive people.

Nearly every village has its professional 'hunterman,' whose duty it is to kill the larger game which do damage to the crops, and whose pleasure is to shoot the smaller antelope for food, and occasionally to act as a guide to the white sportsman. In the latter respect he seldom displays the same eagerness or skill as the Indian *shikari*. In the larger villages there are several of these 'huntermen,' who were always much to the fore in the welcome accorded to the Governor on his late tour. The 'hunterman' of the southern province, armed with muzzle-loading 'dane-guns,' would let off deafening charges right over the Governor's hammock; but as we approached the north and left Coomassie

(whence powder has to be obtained) farther and farther behind, firearms gradually gave place to the more picturesque bow and arrow, and the deafening discharges to mimic show by archers, lightly clad, with antelope-skins over their shoulders, if not stark-naked. Large herds of elephants visit certain localities every year, and leave unmistakable tracks in the marshlands which they prefer, besides occasionally breaking down the light culverts of Government roads encountered *en route*. Lions frequently raid the villages, and actually took a man out of his hut at one place a few days before our arrival; but though a few have been shot lately, they cannot be said to be as common as they are elusive.

Perhaps the most interesting of all the natives of the Gold Coast hinterland are the Fra-Fras. The name Fra-Fra is in reality a nickname (from *fura-fura*, meaning 'good-morning') for three kindred tribes, the Nankannis, Nankurassis, and Kasassis. From their stronghold in the Tong Hills the two former used to be the terror of passing caravans, until less than two years ago they were dislodged therefrom by a company of the Gold Coast regiment, assisted by the constabulary. It is on their account that a detachment of one company, the only military force in the Northern Territories, is stationed at Zouaragu, within sight of the Tong Hills, which are now forbidden ground. Since the recent opening of a station at Bawku, the Kasassis of that district have prospered, and are no longer the crude savages they had the reputation of being a few years ago. Their women appeared to me particularly well clothed, and the ladies of the 'fig-leaf' are far less common than amongst the Grunshis, another tribe in the extreme north, but west of Bawku.

Most of the tribes have distinct tribal marks, consisting of cuts on the face in varying patterns. The most remarkable of all is the Fra-Fra tribal mark, an elaborate but symmetrical pattern of groups of parallel cuts on the forehead, cheek, and chin. Girls are often marked also with similar patterns on the body, and in spite of the mutilation of their skin have a real fascination of their own. Frequent visitors to the Gold Coast are the Moshis, Wangaras, and Basaberimis, from French country. There are settled communities of the first-mentioned—a Moshi can be recognised by three long parallel cuts on each side of the face—at Bawku, Zouaragu, and other places in the hinterland. The Wangara tribal marks are three cuts splaying outwards from the corners of the mouth, often seen amongst labourers on the gold-mines of Ashanti and the colony. Less common is the Basaberimi, with a pretty lemon-pip pattern on each side of the face, who travels occasionally all the way from the Niger valley to enlist in the Gold Coast regiment or police.

All the tribes referred to in the preceding paragraphs are without doubt closely related

to one another. To a different category belong the Fulanis, who still form the ruling class in Northern Nigeria, and a distinct, though humbler, portion of the community in the Northern Territories. The Fulah, who claims Timbuctoo as his native country, has probably Moorish or Arab blood in his veins, for his sharp features are a remarkable contrast to those of his Negroid fellow-inhabitants of the Niger valley, and his fatalism smacks of the desert. He is essentially a herdsman, and in the Gold Coast hinterland indispensable, for without him the cows remain unmilked and the natives of the country lack the milk which they like, and yet will not obtain for themselves.

The samples of native dances to which we were treated were modest, but on the whole monotonous. The usual female dance is a tiresome *pas seul* with bent head and shuffling feet. At Bole, Lorha, and other villages there are the 'monkey dancers,' men with tails of *tie-tie* (native rope) and anklets of loose pieces of tow, who follow each other round in a continuous circle, and contrive to make an astonishing din by a shaking movement of the feet. At a tiny village called Tuna, in Bole district, where the natives seem to have a comparatively varied repertoire, we were spectators of a rather effective and amusing cotillion, of which I will endeavour to give the reader some idea. It is not possible to do justice in print to the performance, which might be counted vulgar by persons unacquainted with the savages' code of vulgarity and unable to realise the grave, almost refined, demeanour of the performers themselves. Imagine two solemn, dark damsels doing a turn not unlike the chassée of Sir Roger de Coverley, but with a far greater vigour than ever was seen in an English ballroom; the steps consisting of gazelle-like springs on both feet, in perfect unison with the drums, and the whole manoeuvre culminating in a severe shock between their two unmentionable extremities! At Y'pala, where we stayed the night after passing Tuna, the 'dancing-mistress' had instituted a system of turns whereby the dance began with the two youngest girls and ended with the two oldest hags in a continuous round, the elderly performers often making up in skill and manoeuvre what they lacked in grace. There are no doubt other dances of a coarser type which even the native idea of modesty forbids to be performed before Europeans.

Musical instruments other than the drum are quite exceptional. The Lobis of Lorha district in the extreme north-west have a kind of xylophone, the 'notes' consisting of wooden staves, to which variety of tone is given by a number of graduated calabashes forming the base of the instrument. The effect is quite pleasing, but somewhat marred by the too great insistence of the inevitable drum accompaniment. The Kasasas of Tili, near Bawku, have a kind of primi-

tive violin, with a gourd as the body of the instrument, and a small semicircular bow which produces a few mournful notes out of a single string. Drums are of all sizes and conditions, the greatest variety being seen at Navarro, the capital of Grunshi country. Here we listened to a concert of hide instruments, wherein the usual order of things was reversed by some monsters being placed in the forefront, while the kettle-drums barely contrived to make themselves heard from the back in the brief intervals caused by fatigue of the more prominent performers.

As to morals there are great diversities of opinion; but it seems to be the generally accepted view that the modesty of women only begins where in civilised society it is not uncommonly supposed to end. That such a curious idea of morality, if carried to extremes, is harmful for the race can hardly be questioned. But that there are points in its favour, if carried out in moderation, as I believe it to be in the Gold Coast hinterland, is proved by the fact that the native of that country is second to no other West African negro in physique, amiable disposition, and courage under discipline, whilst disease and deformity are almost unknown to him.

One of the most astonishing characteristics of this people is the small part that 'religion' appears to play in their daily life. There are amongst the pagan inhabitants certain superstitions, usually connected with the supposed powers of the medicine-men. But fetish idols, which obtrude themselves so constantly on the notice of travellers in Ashanti and the coast regions, are far less prominent in the Northern Territories. Of mutilations of face or form, so common amongst savages of primitive type, the only signs are tribal marks on the face and occasionally on the body, which in no way interfere with the natural life, comparatively free from superstition, led by male and female alike. In 1905 there was a serious attempt made by emissaries sent from Mecca itself to stir up a Mohammedan 'revival' in this part of Africa. Many converts were made, and some uneasiness was caused amongst officials by the militant character of the propaganda. Local enthusiasm subsided immediately on the expulsion of these emissaries; but undoubtedly large numbers are still professing Mohammedans. There are even Mohammedan temples to be seen in some places, weird mud structures with pointed steeples decorated with an irregular pattern of short, protruding stakes. Few of the natives, however—if we except the Fulanis, who are intruders—appear to have the Mohammedan temperament, and I doubt if 'the true belief' has gone very far, or will go much farther, amongst the happy-go-lucky inhabitants of the Upper Volta valley.

These random jottings from the back-of-beyond do not claim to be more than the impressions of a traveller whose knowledge of native

life and customs is a matter of observation rather than of study. I have been unable to find any studies, scientific or otherwise, of this particular region of Africa beyond an admirable report by Colonel Northcote, who first took over the territory for the British Government, and some French monographs on adjacent territory under their rule. A very interesting field for ethnographic and anthropological research is opened by our occupation of the hinterland; and this country has, moreover, an historic past, closely interwoven with the movement of races in the

great African continent. The seed of civilisation has now been sown on the soil left fallow by centuries of neglect, and already bears the early fruit of happiness and content amongst the natives; but it is only through a sympathetic study of native life and customs that a full harvest of material prosperity can be reaped at some future period without the loss, meanwhile, of those pagan virtues common to many primitive peoples, but nowhere more evident than among the fine races of the Gold Coast hinterland.

AT THE QUINTA PALAFOX.

CHAPTER IV.

'YES,' answered Joaquina, replying to the bewilderment and the consternation of the man, 'it is a secret of the Quinta. My countrymen have used this secret passage to gain information, to overhear what the enemy said, as long as the invaders have been in the Quinta. Now'—— She stopped.

She looked down into the darkness again. Recollecting that there was no light below, she came back into the outhouse, took a candle from a box in a corner, lighted it, and with it in her hand went back to the steps. 'Follow me,' she said to Antoine. 'I know the way. We may be able to reach Colonel de Rubeaupré this way.'

Antoine carefully lowered his great body into the aperture, and no sooner were they at the foot of the steps than he took the candle from the girl's hand, and, raising it first on one side and then on the other, began a methodical survey of his surroundings. He stood in a large, vaulted chamber.

'The corn-chamber when the Quinta had to stand sieges,' Joaquina whispered to him.

Antoine nodded. The two went on again. The next room was much like the first.

'How many are there?' Antoine was beginning, intending to ask her if there were not a way up from these store-vaults into the heart of the house, when a sudden action by Joaquina stopped him. She put her hand on his arm. In the faint, flickering light of the candle, Antoine saw a new expression of horror spring into the girl's dark eyes, saw her face drawn down into lines with a hideous terror.

'What is it?' the big man asked.

'Do you hear nothing?' Joaquina gasped.

The soldier listened.

'Do you hear nothing?' the girl repeated.

'Do you not?'—her voice hissing in its suppressed vehemence—'hear it dripping?'

'I hear water dripping,' began the Frenchman.

'You do not understand,' cried out Joaquina.

'It is not merely the dripping of water; it is that the spring in the court has been set working; it

is that the water in the well is flowing into the great tank. That is another secret of the Quinta. There is a contrivance, a wheel in the masonry at the head of the well in the courtyard, by which the water can be turned off into a tank below. It is an old device—ever so old. It is said that Dom Pedro invented it so that if an enemy captured the Quinta he might be able to deprive them of water.'

'If it is so old'—— Antoine began.

Joaquina stopped him again. She guessed the thought in his mind.

'However old it is, the contrivance works,' she returned. 'My grandmother had it put in order in case it might be of use when the French came. Now'——

The girl broke off. She went along a few steps. About her were the massive walls of the old store-chambers, and coming faintly to her in the damp and the dimness was a steady, even dropping. She put up her hands and pressed her fingers into her ears as though to shut out the even, thudding sound, then looked about her wildly.

'What is it?' demanded Antoine, for there was evidently more here than he understood.

The girl turned round and faced him. 'Dom Pedro used the contrivance for other things,' she told him.

'For what?' demanded Antoine.

'To torture those he wanted to get rid of with a death by inches,' Joaquina faltered.

'To torture'—— the soldier began.

'Don't you see?' cried out Joaquina. 'The water falls into the tank drop by drop. It rises so slowly—it might take hours—if a man were shut into that tank'——

Antoine had heard enough. '*Grand Ciel!*' the soldier cried out, 'the old woman has shut my master into the tank; she has turned on the water; he is'——

Joaquina was past speech. She bent her head. But Grandet did not so much as notice the gesture. He was hurrying through the stone vaults in the direction of that regular, mono-

tonous dripping. Joaquina, with her knees trembling, her hands cold, and her face aflame, followed him.

Antoine hurried into the next cellar. There was damp on the floor of this one; a little trickle was running down the drain in the centre. The faithful servant followed the line of that drain until he found himself in front of a massive square tank of stone some seven feet high, open at the top so that no victim might die of suffocation before he had time to drown.

Grandet walked up to this huge erection. The first thing he saw was that the trickle of water he had followed emerged from one point at the base of the tank. But before he bent to examine that egress, before he tried to make out whether it might or might not be made to serve him in any way, he shouted. '*Mon colonel!*' called the faithful soul—'*mon colonel!*'

At first only the dropping of the water answered him; then there came a faint sound, but a sound which was unmistakably that of a human voice.

It was enough for Antoine Grandet; it was enough for Joaquina. The two standing outside that great square erection of stone were animated by the same resolve. They were both of them certain that Louis de Rubeaupré was slowly perishing within; they were both of them determined to rescue him.

'But how?' breathed Joaquina, giving voice first to the difficulty that was but too apparent to both of them.

Antoine Grandet did not answer the question. He walked round the four walls of the tank. On every side he met a smooth surface. He concluded that the victims were somehow dropped into it from above. He looked round the vault. There was nothing to help him there, though there were great rings in the walls that suggested horrible possibilities. He came back to the tank, and, hardly hoping anything from it, bent down to examine more minutely the trickling overflow. The water came out at one place, and at one place only. Antoine concluded, therefore, that this must be the result of some arrangement, and not, as he had at first thought, of a defect in the masonry. He thrust the blade of his sword between the bottom of the tank and the floor. It went in a little way and then encountered something hard. Antoine pushed against the obstacle, and then, to his great amazement, the large slab of stone grooved to form the drain opened an inch or so. The Frenchman did not know what might result, but instantly he set to work to widen the opening.

He worked with all his might, and threw the whole of his ponderous weight against his sword, which he was using as a lever. There was the danger that the tampered steel might snap. Antoine knew this, and yet he went on.

The perspiration dropped off the honest fellow's face. Joaquina looked on, her lips

trembling, her hands clasped. Then the water began to gush out of the tank; it came forth gurgling as it fell into the hole that the stone disclosed; it rose and flooded over into the cellar.

It increased in volume until a new fear presented itself to the soldier. '*Mademoiselle!*' he exclaimed, 'this isn't something more—another of these devices? It won't flood the whole cellar?'

'I know of nothing,' said Joaquina, as she stood with the overflow wetting her feet, with the gurgle and the rush in her ears.

In reality this horrible situation lasted for but a fraction of time, though it seemed an eternity to the two watchers; then the volume of water sensibly diminished.

They had merely opened a sluice which emptied the tank.

Antoine waited until there was but the dropping from above, but the trickle from below. Then he bent down. He felt for the bottom of the drain. When he encountered a solid foundation he lowered himself into it. He stood a moment, his arms resting on the floor of the cellar, while he stamped with both his feet to make sure that the drain would not give way and drop him into the well or whatever carried off the water that he had released from the tank. When so much was safe, he bent down and inserted his arm into the sluice which emptied the tank. It went in without difficulty; then he moved it up as far as it would go—up, down, to and fro. Finally he raised himself.

'*Mademoiselle,*' he said, '*Antoine Grandet is going to wriggle through this hole, or he is going to squeeze to death in it.*'

If Joaquina really understood, she uttered no protest. She watched the faithful soul divest himself of his coat; she watched him pull off his boots; she watched him take his sword and push it along before him.

'Be ready, *mademoiselle,*' Antoine counselled as he lowered himself into the drain again.

It was a desperate venture, and Antoine knew it. The drain was some five feet deep, and the sluice into the tank just wide enough to give him a chance of success if he got through quickly. If he got fast he was doomed, as the falling water flowing to the outlet would assuredly suffocate him.

There was nothing for Joaquina but to wait. She sank to her knees and lifted her hands. Antoine had stuck the candle upright on a ledge, and it cast uncertain, flickering shadows about her. She knelt there in the stillness. She seemed to be hours alone. She turned her head sharply from side to side as if in one corner or the other she was sure to see her grandmother's cruel eyes fastened on her.

At length, after Joaquina had lived through a time which made her know herself—her heart, her love—as nothing else ever would, she heard her name.

It was Antoine Grandet calling to her. He was alive, then; he was within the tank. She rose and went towards the sluice. She saw nothing there. She snatched up the candle and hurried round to the opposite side. There she saw the end of a rope hanging over the brim of the tank.

'Pull!' called Antoine laconically.

Joaquina was afraid that the rope hung too high for her to catch it. '*Madre di Dios*, but I cannot fail!' the girl implored. She sprang up. Her fingers just touched the hempen surface, but failed to grasp it. '*Madre di Dios*, it is for his sake!' implored the girl.

She tried again. The second time she was more successful. She began to pull at the rope. She felt that there was a weight on it. She prayed to the Holy Mother, to all the saints, that it might be heavy with Louis de Rubeaupré. When she saw Antoine's head appear over the top of the cistern she knew that he held a form in his arms, and that she had been assisting him to hoist up this form.

Grandet looked over, measuring the distance to the ground. He was evidently wondering how to lower his burden down. Finally he called to Joaquina to throw her end of the rope back to him. He caught the end as it came upward, coiled it, then he slid his colonel's form over the rim of the tank, and cautiously paid out the rope until Joaquina could catch the human bundle and guide it to the ground. Louis de Rubeaupré had fainted.

For a moment longer Antoine hung by his hands; then he dropped and stood by Joaquina. He looked at her. 'He is alive,' he said to her. He saw her gaze with dismay at the closed eyes and the white face lying at her feet. 'They had tied him upright against the post that I suppose was put there so that poor souls might take as long as possible to drown. I undid the rope and tied it round him. I threw one end to you, for I could never have climbed up the post without you to help, and as you pulled I guided him up.'

'How did you climb up yourself?' breathed Joaquina.

'As for me,' said Grandet—and that was evidently a matter of small moment—'I clung on to the staples in the post that the rope had passed through. It was nothing, I assure mademoiselle. A veteran learns to climb like a cat as well as to fight.'

The next moment Louis de Rubeaupré opened his eyes and became conscious again. He knew that he was saved; he saw Joaquina, and in some way he realised that she had had a hand in freeing him.

Antoine left the two of them for an instant while he went and searched for a certain flask that was in his coat-pocket. It was one of the old campaigner's cherished possessions. Eau-de-vie, the veteran was wont to proclaim, saved more lives than all the doctors in the camp. He poured a little of the liquid down his colonel's throat. The fluid revived Louis. He looked from his servant to the woman he loved.

'You did this for me?' he began.

'And,' put in Antoine before another word could be said, 'mademoiselle here must do more yet.'

'What must I do?' asked Joaquina, very happily, very softly.

'You must go back, mademoiselle,' the big man assured her, 'and you must see that no one is in the outhouse.'

'After that?' breathed Joaquina.

'I will bring the colonel up that way,' Antoine answered, 'and then I will carry him to the French lines on my back. My pass gives me six hours. I can do it before the time is up.'

The girl bent her head. For an instant she would not meet the blue eyes which were awaiting her glance.

She rose; she made a movement as if she would go without another word.

'Joaquina,' cried the Frenchman passionately, 'I cannot let you go; you cannot leave me.'

'Of course not,' put in Antoine Grandet stolidly, taking it upon himself to answer this momentous question. 'But it is I, Antoine Grandet, who, when I have left my master in safety, will come back for mademoiselle.'

THE END.

THE MONTH: SCIENCE AND ARTS.

SOLVING THE PETROL PROBLEM.

THE increasing cost of petrol constitutes one of the most disturbing factors in motoring circles at the present moment, and has led to considerable academic discussion. So far as Great Britain is concerned, it must be admitted that very little has been done to mitigate the difficulty. Here is a splendid field for inventive effort, and the brains which succeed in unravelling the problem in a practical, simple, and

inexpensive manner will accomplish one of the biggest achievements in the realm of commercial science. Petrol, as is well known, is one of the higher distillates of petroleum, and in its production the baser liquid fuel, kerosene or paraffin, is thrown out. Before the arrival of the high-speed internal combustion engine the prime product was paraffin, the more volatile spirit being waste, which was burned as refuse. To-day the position is reversed. The spirit is the article for which the distillers mainly strive; and the

heavier oil, being ousted from its former market, is thrown on the hands of the refiners. Seeing that a greater proportion of paraffin than petrol is obtained from a given quantity of crude petroleum rich in the volatile constituents, it will be realised that this superfluity of paraffin is a serious item to the manufacturer. Accordingly, to recoup for the loss arising from the disposal of the lower-grade fuel, the purchaser has to pay more for his spirit. The oil-producers have been assailed vehemently for their avaricious tactics; but it is only another interpretation of the old law of demand and supply. The solution of the problem rests with the engineer; he is the man who should be persecuted, not the oil-refiner. If the former were to concentrate his energies upon the evolution of a rational carburettor capable of vaporising paraffin the trouble would end. The average motor-engineer will retort that it is a hopeless quest. But science is unfamiliar with the word impossible. The American motor-engineers, who are more vitally affected by the rise in the price of petrol than their British colleagues, instead of wasting their energies upon pen, ink, and paper, are striving to make their engines run by paraffin. One firm is within measurable distance of success, as its vehicles burn paraffin, which costs in America twopence halfpenny per gallon, as compared with the more volatile fuel costing a shilling for the same quantity. If the American engineer can solve the problem, it is surely not beyond the skill of his British colleague to do so. Substitutes will never be able to compete with the original article; but many automobile manufacturers in the United States are to-day fitting their cars with two tanks—one, of small dimensions, within the other. The small tank carries a supply of petrol for starting the engine, and when it is fairly under way the petrol is cut off and paraffin is used. This meets the situation very efficiently, though it cannot compare with a direct system of using the denser oil exclusively.

AN INGENUOUS ADJUSTABLE ASH-GUARD.

When describing the Houghton adjustable fire-grate in a recent issue of the 'Month' we referred to the fact that the under-part of the grate was necessarily left open. In the average room this is a great disadvantage; but the drawback has now been very ingeniously overcome. An ash-guard has been devised which can be adapted to any type of grate, whether fitted with the Houghton invention or not. The guard may be described most suitably as a number of small palings about four to six inches in height, set upon two parallel longitudinal supports. The pieces are not attached to one another, but their two edges, being bent at right angles to the face and pierced with holes, enable the sections to be threaded on to the foundation, which comprises two pieces of round iron about three-eighths of an inch in thickness. At one

and the outermost piece is kept in position by a nut with the foundation burred over, while at the other extremity the two rods are threaded and carry a nut which can be screwed up to hold the pieces in position. As the edges of each section merely press together and are not attached, the guard can be bent to the shape of the grate. The ash-guard is made in various styles—in copper and brass, both burnished and lacquered, as well as with antique finish. The brass guard is to be recommended, as it possesses the best wearing qualities, and does not discolour with heat. It is made in stock-sizes both as regards length and height, and small knobs are fitted to enable the guard to be moved easily. It can be made to fit any grate-front within its length, as by releasing the nuts it can be shortened to suit the conditions. Any mechanic can accomplish this in a few minutes if the purchaser is unable to make the alteration himself. It is an ingenious invention, and gives a very neat finish to the fire-grate. After doing service in one room, it can be adapted to the grate in another in a few seconds. As the guard is fitted with two small, substantial feet, it maintains its position when set.

A SHORTHAND TYPEWRITER.

From time to time attempts to increase the efficiency of the office have been made by the evolution of machines for printing a shorthand system. Some two or three years ago an English device of this kind appeared upon the market—the stenotype; but it failed to create more than a passing interest. Now another machine, with a similar name, has appeared in the United States, with which, it is reported, a skilled stenographer has attained a speed of five hundred and ninety-two words per minute. This machine differs from its English namesake in that, instead of carrying certain signs to represent letters and words, as in a shorthand system, it prints phonetic spelling. It has twenty-two keys, seven at the left of the keyboard being initial consonants, the remaining seven possible initial consonants being obtained by combinations of the first seven characters. On the right-hand side of the keyboard are ten final consonants, the balance of eight possible finals being likewise obtained by combinations. In the centre are four keys corresponding to the vowels *a, e, o, u*, the fifth vowel, *i*, being supplied by a combination. The stenographer using this appliance works in conjunction with a system of abbreviation or code. The idea, although introduced with true American advertising, is far from being new; and, so far as experience in the Old World is concerned, such machines have not proved very capable time-savers. A German inventor has recently introduced a typewriter in which complete syllables are printed; but here again the intricacy of the system demands hard and constant practice for several months to attain

complete efficiency. As the phonograph is coming into use extensively, while to save time many dictate straightway to the typist, and, in addition, simpler and easier letter-copying methods are being adopted, the advantages of a shorthand typewriter appear to be somewhat limited.

A RAPIDLY GROWING CITY.

One naturally looks to such new countries as Canada and the western United States for instances of amazing growth of cities. Therefore it is somewhat surprising to learn that one of the most rapidly growing centres in the world to-day is in South America. This is São Paulo, the capital of the coffee-growing state of Brazil. Its present population is nearly four hundred thousand, yet its progress is so remarkable that within the next twenty years it is expected that it will touch the million mark. During the year 1911 four thousand houses were built, and were snapped up before they were finished. Rents are exorbitant, as may be imagined. In view of the city's future, a comprehensive and expensive modernising system, which will even eclipse the 'Hausmannising' period of Paris, is to be undertaken. The authorities have already completed a magnificent opera-house which ranks as one of the finest in the world. The old cathedral is to be demolished, and a new building of imposing architectural magnificence is to be built on the site at a cost of four hundred thousand pounds. The boulevards, viaducts, asphalted streets, promenades, and a public garden, designed by M. Bonvard, the architect to the French capital, will entail an outlay estimated at four million pounds, to which the State has already made a first contribution of seven hundred thousand pounds.

ALUMINIUM TANK-WAGONS FOR RAILWAY TRANSPORT.

One of the latest developments in connection with aluminium is its application to the transportation in bulk of liquids upon railways. Its light weight certainly offers many recommendations for such service, seeing that a cylindrical vessel of two thousand seven hundred and fifty gallons weighs only one ton. The development enables a big saving to be effected in freight charges, while the hygienic properties of this metal should recommend its use for the carriage of edible liquids in bulk. For instance, it should serve to supersede the unsatisfactory methods now in vogue for conveying milk from the dairy-farming districts to large retailers in big centres. The can now used is primitive, while it does not coincide with present-day interpretations of bulk transport. By means of the aluminium tanks a far greater quantity can be carried on a single truck than is possible under present conditions, the contents are better preserved from outside influences, and the work of filling and emptying is much easier and more

quickly done. Moreover, by resorting to steam flushing, far greater cleanliness of the vessel itself may be secured. The tank is also adapted to the transport in bulk of edible oils, chemicals, and other fluids. The idea is not limited to railways; and, as the tank can be used with equal facility upon the highroads in conjunction with motor-lorries, it should prove a useful adjunct to the dairy-farm where carriage is by road from producer to consumer.

THE ECONOCOOKER.

Devices for facilitating and simplifying the housewife's most difficult task of cooking appear to be endless. Certainly a wonderful display of fertile ingenuity is manifested in this direction. The latest is the econocooker, which, as its name implies, claims to be an economical apparatus for preparing comestibles for the table. The system certainly is the acme of simplicity. In this device neither flame nor fuel is necessary except as an accessory, the task being performed, one might say, by radiant heat. The apparatus comprises a tray, over which drops a large bell-cover so as to envelop the contents completely. This cover is lined with an insulating material which serves to keep in the heat. Within this device are placed a number of cast-iron discs which have been heated on a fire, gas-ring, or what not to such a degree that water will hiss when dropped upon them. These discs are laid on the tray, and thereon are placed the various culinary utensils supplied with the apparatus, each of which contains the desired article—fish, meat, soup, vegetables, sweets, and so forth. The cover is then slipped over the whole and locked. The heat stored up in the cast-iron discs, radiating throughout the confined space, cooks all the articles simultaneously. After the vessel has been locked no further attention is required, the food being cooked gently and thoroughly; it cannot be spoiled by too fierce a temperature, and yet cannot be underdone if the proper time is allowed. Even when cooked it cannot spoil if left in the cooker, because the heat merely keeps it in the heated condition. Moreover, the losses arising from cooking are reduced to the minimum. There is no smell or dirt, and no utensils are required beyond those supplied with the appliance. The dishes in which the articles are prepared can be transferred direct to the table in the same manner as casserole or fireproof china, as they are not soiled or rendered unsightly in the cooking process. It is claimed for the invention that it reduces the art of cooking to a mechanical operation, and the dishes certainly retain all their nutritive properties. The saving in fuel and the avoidance of waste arising from inattention, such as prevails with a coal or gas fired oven, more than recoups for the initial outlay for the apparatus. Efforts are now being made towards applying electric cooking to the device, inasmuch as there

are many conditions where the heating of the discs becomes impossible by existing methods. This can be effected by heating the discs electrically before inserting them. The invention is rational, and should meet with success, although at first the careful housewife will not readily believe that a task which to her is one of grave concern can be accomplished so easily and completely.

PAPER CLOTHING.

While the day has not yet dawned for our clothes to be fashioned from paper, yet a step in this direction has been made. As is well known, paper constitutes an excellent material for securing warmth in wintry weather. An American firm has introduced what it calls a paper vest. In reality it is a kind of waistcoat that can be worn by men, women, and children, the idea being to wear it beneath the ordinary outer clothing. It is made of a stout, soft material throughout, and fastened in front with laces instead of buttons. It has been subjected to exacting tests—the North American winter is sufficiently cold to demonstrate the efficiency of such a garment—and has been found highly successful. The wind cannot penetrate the material, while all the bodily heat is retained. The vest is extremely light, and has practically no bulk, so that the fact of its being worn is not discernible. Owing to the care exercised in the selection of the paper, the vest has a long life, and when its period of usefulness is over it can be thrown away without one feeling that it is an expensive luxury. These vests are sold in the States for about two shillings, and the meed of popularity which they have received should be a sufficient inducement to British manufacturers to market a similar article.

TWO THOUSAND POUNDS AWAITING AN INVENTOR.

The New York, New Haven, and Hartford Railroad Company, having suffered two terrible accidents on its system through the drivers deliberately disregarding the signals set at danger, are attempting to eliminate dependence upon the human factor in the driving of trains. The Interstate Commerce Commission, after deliberating upon the second accident for two months, recommended that the railway companies 'ought to experiment unitedly with the automatic train-stop until a device of practicability for general use shall be available.' Thereupon the above-mentioned company decided to stimulate inventive genius, and to search for a practical apparatus whereby the engine may be pulled up, either by setting the air-brakes or closing the steam-throttle automatically, in the event of the signals being set at danger. To secure this a prize of two thousand pounds has been offered. The stipulations are not exacting, and inventors will not be able to complain about scant treatment if they possess a feasible idea. Its test of efficiency is to be its adoption within the

years 1913, 1914, or 1915 by either the New Haven, the New York Central, or the Pennsylvania Railroads, or its approval and recommendation by the Interstate Commerce Commissioners.

THE COAL-ENGINE.

One of the reasons why oil-engines and petrol-motors have become so popular is that the actual engine which does the work is the only piece of mechanism needed; whereas with a steam or gas engine we have the extra trouble of looking after a boiler or gas-producer, together with the additional space taken up and some risk of explosion. Furthermore, the amount of fuel consumed by a large oil-engine is very much less than is required for a steam or gas engine of the same power. Thus, if an oil-engine uses half-a-hundredweight of oil a day, a gas-engine of equal power needs one hundredweight of coal, and a steam-engine one and a half hundredweight, to give the same power; and it is only the much higher price of oil which still allows gas and steam engines to find a market. Now, if we had an engine which consumed only the same weight of coal as the oil required by an oil-engine—half-a-hundredweight in our example—and needed no boiler or gas-producer, the coal-engine, as we may call it, would have all the advantages. This coal-engine is now an accomplished fact, having been invented by Dr A. M. Low; and experiments with an engine of one hundred horse-power have shown that the weight of coal consumed does not exceed the weight of oil needed in some of the most economical oil-engines. Although coal is apparently fed into the engine, it really passes through a gaswork in miniature. In ordinary town gasworks the gas is made in retorts containing coal, which are heated by a furnace built round them. In the coal-engine the retorts are in the form of tubes which pass through the end of the cylinder just beyond the point to which the piston comes. Now, the explosion of gas and air causes very great heat; in fact, a gas-engine cylinder would actually be burnt or melted if it were not surrounded by a water-jacket. This heat acts the part of the furnace in the town gasworks, and gas is given off by the coal in the tubes, to be subsequently drawn into the cylinder as required. The coal is kept slowly moving through the tubes by revolving worms, and by the time it reaches the ends it has burnt away to ashes, which fall out into a suitable receptacle. The action is quite automatic; it is only necessary to fill up a hopper with coal, and the engine will run for hours without further attention. Another development likely to have similar effects is the production of tar-oils from coal, which still leaves a rich coke for domestic and other purposes. These tar-oils are already used in oil-engines, and eventually the results may prove even better than in the coal-engine. In view of

these developments, we need not suffer any anxiety as to the failure of our sources of power in time of war.

'THE CANADIAN BOAT-SONG' AGAIN.

The authorship of this poem has been variously ascribed to John Galt, J. G. Lockhart, Professor John Wilson, and the twelfth Earl of Eglinton. The writer of the article on Galt in *Chambers's Cyclopaedia of English Literature* thinks that to credit either Galt or the Earl of Eglinton with its authorship is equally absurd. The poem is so unlike Galt's other verses that more direct evidence is required to prove that he was the author. Mr G. M. Fraser, of Aberdeen Public Library, in his *Literary and Historical Sketches* (1908), makes a laboured attempt to prove it to be wholly the work of Professor John Wilson. Mr Thomas Newbigging, in a recent publication, *The Canadian Boat-Song and other Papers* (Sheratt & Hughes), takes particular pains to prove that Professor John Wilson could not possibly have written the poem, and that the most likely person to have done so was the Earl of Eglinton. The song was first given in print in a *Noctes Ambrosianae* paper by J. G. Lockhart in *Blackwood's Magazine* for September 1829. The poem so inserted was said to be from a friend in Canada, and a translation from the Gaelic. The second verse is one that is most frequently quoted and misquoted:

From the lone shieling of the misty island
Mountains divide us, and the waste of seas;
Yet still the blood is strong, the heart is Highland,
And we in dreams behold the Hebrides!

Fair these broad meads, these hoary woods are grand,

But we are exiles from our fathers' land.

A writer in *Tait's Magazine* for 1849 ascribed the poem to the Earl of Eglinton. The conclusions arrived at by Mr Newbigging are that the song was by one who sympathised with the Highlanders in their being forbidden to wear the Highland garb and accoutrements, and in their banishment from their native land; that it was written long before the altered version that appeared in *Blackwood* in 1829; that in all probability it was written by a soldier who was proud of his country's past, and that none was more likely than Hugh Montgomerie, the twelfth Earl of Eglinton. Why has so little been made of the possibilities of J. G. Lockhart's authorship? The author of one of the best biographies in the language, of several novels, the clever *Peter's Letters*, the *Spanish Ballads*, and the pathetic verses on immortality so often on the lips of Carlyle in his later days, was surely quite capable of writing the poem. We have good authority for saying that the letters and papers of Lockhart in the archives of Mr John Murray, publisher of the *Quarterly Review*, were not laid under contribution for Andrew Lang's biography of the son-in-law of Scott. There might be a hint in some of

these letters, for he wrote most of the above-mentioned number of the *Noctes* while editor of the *Quarterly Review*.

A GREAT AUSTRALIAN DAM.

An Australian correspondent has described the new Burrinjuck Dam in New South Wales. It is the second largest dam in the world—second only to the Assouan Dam; and although not yet finished, it has already come into use. It is set between two granite mountains that rise from opposite sides of the Murrumbidgee River. Forty-five miles of the river are held back by this great wall in the neck of a gorge, and when the dam has risen to its full height of two hundred and forty feet the enclosed lake will be half as large again as Sydney Harbour. Two hundred miles farther down the river, at Berembed, another great work is contemplated. When the combined system is complete, between five and six million acres will be served. Vast tracts of the so-called barren land of Australia could be made to blossom if irrigation were as scientific as in some American states. 'Immigration and irrigation' is the motto for Australia. The Director of Australian Immigration announces that irrigated farms are now available for farmers in the Murrumbidgee Valley, irrigated by the Burrinjuck Dam. The New South Wales Government will give assistance in house-building, fencing, grading, and seeding to a limited number of British farmers.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE CHOICE.

Do what is right, and I will be content!
I say it bravely, though, at times, grim fear
Shake my weak heart and make the burning tear
Well up to blind mine eye. I was not sent
Into your life to bid your soul relent
From its high sense of duty. Through each year
Follow that pathway till it disappear,
However far from me those years be spent!

Is there no other morn, that we withhold
This day of life, though long, at Duty's call?
If parted, shall we trudge on through the cold,
Uncomforted of God? And will there fall
No gleam of glory from the hills of gold,
Where all paths meet, and God is all in all!

KATE MELLERSH.

The April issue of Chambers's Journal will contain the opening chapters of a New Serial by J. J. BELL, entitled

ATLANTIC GOLD;

also complete Short Stories and Articles of general interest and entertainment.

Chambers's Journal

SEVENTH SERIES

ATLANTIC GOLD.

By J. J. BELL, Author of *A Kingdom of Dreams*, *Wee Macgregor*, &c.

CHAPTER I.

YAWNING, Stephen Arcus dropped the newspaper and turned to the window overlooking the rush and crush of Piccadilly. At the end of three minutes he yawned again, and glanced idly round the almost deserted smoking-room. Had the month been June instead of September he would still have been uncertain of finding a familiar face, for his visits to his club were rare. He stretched himself from his long legs to his broad shoulders, and took up another newspaper. The hour was noon. His fresh, lightly bronzed complexion and clear, grayish eyes denied a sleepless night as a reason for all this yawning and stretching; the fingers that held the printed sheets admitted no tell-tale tremors.

There was nothing particularly distinguished about the young man's appearance. He was well groomed rather than smartly dressed. He was neither fair nor dark, and his clean-shaven countenance, while it offered no hint of moral weakness, promised more strength of will, perhaps, than tenacity of purpose. Stephen Arcus must always be doing something. Thus far—he was now thirty-two—he had, in the conventional sense of the phrase, done nothing. He had only seen about three-fourths of the world, and had lived as his neighbours for the time being lived; he possessed, at any rate, the great gift of adaptability. His nearest surviving relations were cousins. An inherited fortune yielded him a trifle over five thousand pounds a year.

The doors at each end of the smoking-room opened almost simultaneously. Through one came a page-boy, through the other a dark, worried-looking man in regulation City garb. Both came towards Arcus; the boy, who bore a telegram on a salver, arrived first. Taking the telegram in his left hand, Arcus rose and gave his right to the new-comer.

'I was wondering whether you were going to turn up, Anstruther. One moment.' He opened the envelope, glanced at the message, nodded a dismissal to the boy, and reseated himself at the little round table opposite his friend. 'In fact, I was going to 'phone you if this wire gave me the news I wanted,' he continued. 'Can you come with me to Scotland?'

'When?'

No. 11a.—VOL. III.

'There's a train at one-thirty.'

'To-day? Good heavens, no!'

'You've been talking about a holiday all summer, and now we're into September.'

'Talking's easy,' said Anstruther wearily, lighting a cigarette. 'But why Scotland? You're not keen on killing things.'

Arcus passed him the telegram. 'I've bought that motor-boat I mentioned yesterday.'

'You haven't lost much time. Didn't you want to have a look at the thing before purchasing?'

'The man for whom the thing was built—a marine engineer, Sir Francis M'Calmont—died the other day. It's a cruiser, not a racer; can stand some weather; fairly roomy, and may be handled by one man; now lying at Greenock on the Clyde. It seemed pretty much what I wanted. Take a cruise with me, Anstruther.'

'You tempt me; but—but what on earth made you buy the boat when you are going abroad again so soon?'

'I've a month to put in before then. I've had enough of town; and my few friends, with the exception of yourself, would expect me to kill things, as you put it; if I accepted their kind invitations to the country. At present I'm not hungry enough to kill things.'

'And you are not yet looking for a wife?'

'Does a man ever *look* for a wife—unless he is over forty, a fortune-hunter, or a widower?' Arcus laughed. 'Did you *look* for the charming lady to whom you are engaged? Of course, I should hardly venture to ask you to come with me had she not been from home at present.'

'I honestly wish I could come, Arcus. But even a stockbroker cannot leave his business on an hour's notice.'

'Your partner can look after things, can't he? I understand you have no boom on at present.'

'Wish we had. But we've got something on which may turn out to be quite as exciting—and ruinous—to many people,' Anstruther drew his chair close to his friend's and lowered his voice. 'My chief reason for coming to see you this morning, Arcus, was to ask you to let me have any bearer certificates of American and colonial securities you may happen to hold. I

[All Rights Reserved.]

MARCH 1, 1913.

shall want them for a month—six weeks at most. Will you?’

‘Certainly, my dear fellow. I don’t hold much in that way, but you are welcome.’

‘Thanks, thanks!’ said Anstruther hastily; ‘but I’m not going to borrow money on them. And I only want securities on which no dividend has been paid within the last few years, and on which no dividend is likely’—

‘I’ll tell my bankers to hand you over all the scrip I have. I’ve got to call at the bank on my way to the station.’ Arcus glanced at the clock. ‘Plenty of time. I packed my bag on chance. What were you going to say?’

‘I must tell you my reason for asking for these certificates. I am asking for the certificates of a similar nature from all our clients who hold them, in order that they may be submitted to an expert.’

‘Hope he may find them worth more than we think.’

Anstruther laid his hand on the other’s arm. ‘I hope he won’t find any of them worth less than the paper they are printed on. Listen, Arcus! What I am about to tell you is a secret as yet. At present it is only a whisper that has reached us from the other side. The papers have not got it so far. One does not want a panic. Perhaps you may remember that about ten years ago some of the Continental municipalities had their bonds forged in a remarkably successful fashion. No doubt plenty of the forgeries are still in existence. Anyway, the forgers are still at large. They may have retired on their fortunes, or they may be directing their skill and energies in another direction. At the moment the bearer certificates of at least three American railroads are said to have received the attention of forgers, and the thing has been so well done that there is no saying how far it has gone.’

‘You mean that the forged scrip may be enjoying a large circulation?’

‘For all we know, the banks and safe-deposits may be full of it. Fortunately for people on this side, they don’t hold much of the American stuff. But there is no reason why British scrip should not be forged also. It’s only a case of science against science.’

‘The police are at work, I suppose?’

‘I don’t know. Probably they are. We’ll hear soon enough.’

‘The public ought to be warned.’

‘The forgers ought not, if they are to be laid by the heels. It’s a difficult question.’

‘How was the discovery made?’

‘A clerk in our correspondents’ office came upon two certificates bearing identical numbers. It took an expert to say which was the genuine one.’ Anstruther sighed and lit a fresh cigarette. ‘Well, that’s one pretty good reason for staying at home, isn’t it?’

‘Staying at home won’t stop the forgers, and

you say you require an expert to test the scrip. Leave the job to him and your partner,’ said Arcus. ‘I see that you can’t come to-day; but why not join me—say on Thursday next week? Join me at Portree in Skye on Thursday night. Leave here by the Great Northern on Wednesday night. How’s that?’

Anstruther smiled uncertainly.

‘Look here,’ said his friend, ‘you’re about played out. But I want you to come for my own sake. You’re the only man I know who would appreciate the trip I have in mind. You don’t get seasick, you’re not too particular about what you eat and drink, you can pass by a golf-course, and you don’t want to talk all the time.’

‘I guess I should want to sleep most of the time. What is your programme after Portree?’

‘We shall run across to the Hebrides, then through the Sound of Harris, and up to West Loch Tarbert, where there is a Norwegian whaling-station. I met the manager in Gibraltar last February, and he gave me a standing invitation. If the weather is anything decent we can make a trip out to St Kilda; and I hope it may allow of our following one of the whaleboats.’

‘By the gods, you tempt me sorely!’ cried Anstruther. ‘It’s what I need—what I desire. I’m sick of money-grubbing. The market-place stinks in my nostrils. All the same, a little motor-boat on the big Atlantic—it’s the open sea, isn’t it?’

‘Oh, we shan’t take foolish risks. You can count on my running for shelter at the first threat of a storm.’ With his pleasant smile, Arcus rose leisurely. ‘Well, I shall look for you on the mail-steamer at Portree on Thursday evening. We’ll stay the night at the Royal Hotel. I shan’t ask you to sleep on board oftener than is necessary.’

Anstruther rose also. ‘I almost think I shall be there,’ he said. As they descended the stair he added, ‘Don’t forget to instruct your bankers about that scrip. Of course you won’t say why I want it!’

‘I understand. Don’t worry if you find a few wrong uns among my certificates. A forgery or two won’t worry me.’

‘I wonder what would worry you,’ said Anstruther with a laugh. ‘But it will be rough on people who can’t afford to lose.’

‘It will be a change to lose on scrip that isn’t genuine. If you come across any specially hard case you might let me know.’

‘I’ll remember that, you philanthropic cynic. But I hope the thing may be less tremendous than my New York friends imagine.’

‘It’s a rotten world in many ways!’ Arcus cheerfully remarked. ‘We’ll get away from it for a spell on Friday morning.’

‘It’s a fine thing to have all you want, Arcus,’ said Anstruther a little enviously, though he shook hands warmly enough.

'Finer to want all you have, Anstruther. Good-bye till Thursday.'

Driving Citywards, the stockbroker pondered his friend's words. 'Finer to want all you have!' What had Arcus meant by that? Was this young man of great possessions growing discontented? What had he that he didn't want? Would he exchange his ease and freedom for something else? Had he fallen in love at last? Anstruther slapped his knee. That was it!

It was not; but, being sadly in love himself, Anstruther may be excused his hasty and somewhat commonplace conclusion. As a matter of fact, Arcus could not then have explained his own words. In a moment of vague dissatisfaction with his own life he had uttered a remark which time might or might not take seriously.

CHAPTER II.

TO a man of Arcus's experiences, the voyage from the Clyde to the Isle of Skye was almost uneventful. He lay the first night at Campbeltown, the second at Crinan, having rounded the Mull of Cantire in fine weather, which held until he reached Tobermory, where he anchored for the third night. Leaving the bay at dawn, he presently encountered a fresh wet breeze off Ardnamurchan; but the *Vesta's* behaviour in a choppy sea was all the agent had promised, and he ran past Mallaig into the Sound of Sleat with a growing pride in his little craft. It took the *Vesta* all her speed, however, to gain Portree's natural harbour ahead of the mail-steamer. The latter landed her passengers ere Arcus could get ashore. He therefore made straight for the hotel, anticipating a little mild chaff from Anstruther.

He found the following telegram: 'Much regret. Impossible leave business. Your scrip in order, but others not. Matters serious. Much worried. Wire your Harris address.—ANSTRUTHER.'

It occurred to Arcus to abandon his trip—why, he could not have explained; but the idea passed like the shadow of a bird on sunny ground, and after engaging a room and ordering a bath he went round to the post-office and wrote a reply: 'Very sorry. Come to Harris if you possibly can. Let me know if I can be of any use. Leaving Portree to-morrow morning. Reach whaling-station some time on Friday, weather permitting. *Vesta* is a treat.' He added the address requested, and also a hope that Anstruther might be able to turn up during the ensuing fortnight, and handed the message and a sovereign across the counter. His smile disarmed the rather severe-looking woman, who was ready to evince her contempt for a person so regardless of his ha'pennies. She made a mild inquiry respecting a carelessly written word,

gave him his change quietly, and returned his parting salutation almost amiably.

The trifling incident is mentioned because it was typical of the young man's way with the world at this time. Only he who literally takes no thought for the morrow can smile as Arcus smiled. You may say that he was thinking of the morrow when presently he purchased petrol; but, as a matter of fact, he was merely accepting the statements of the gauges on the *Vesta's* patent tanks.

It was the beginning of the end of the short tourist season in the Western Highlands and Islands. Still, the hotel was comfortably filled, from a proprietor's point of view, though many of the guests would sojourn but for the night. At dinner Arcus fell into conversation with his neighbour, a middle-aged man whose complexion, like most of the complexions in the room, had not been tanned by a native sun and air. This individual vouchsafed the information that he was a Londoner, and had been enjoying a fortnight's fishing in South Harris.

'You ought to go to Harris. I have taken my holiday there for twenty years. Do you fish?'

Arcus replied that he had fished from necessity on various occasions, and that he was crossing to Harris on the morrow.

'But you can't. There's no steamer till Saturday—Saturday at 6 a.m.'

Arcus mentioned his motor-boat.

'In that thing? Pardon me. But really—do you mean the little gray boat that came into the harbour this afternoon?'

'Yes.' Arcus was amused. 'I hope she will carry me there. I am bound for the whaling-station in West Loch Tarbert.'

'Ah! I visited it one Sunday last year. Very interesting, but—er—odorous. So you will leave your boat in East Loch Tarbert, and drive across to—'

'No; I go all the way by water.'

The middle-aged gentleman, laying down his knife and fork, stared solemnly at Arcus. 'Not by the Sound of Harris?'

'That's my route.'

'You are telling me that you are going through the Sound of Harris and into the Atlantic—the open Atlantic, mind you!—in that little boat!'

'I shall defer to the weather, of course. I'm not travelling against time,' said Arcus.

'You have passed through the Sound before?'

'No.'

'Then you must certainly take a pilot. You should find one at Rodel.'

'I have a chart.'

The middle-aged man shook his head, shrugged his shoulders, and was about to take up his knife and fork, when a waiter whipped away his plate. He let it go, and repeated his gesture of doubt. 'I'm sure I wish you a safe passage,' he said at last, and remained silent during the rest of the meal.

An hour later, however, he came to Arcus in the smoking-room and unfolded an excellent map.

'You see the Sound of Harris—also the Atlantic Ocean—the open Atlantic, mind you!' he said, pointing.

Arcus nodded. 'Things are never so bad as they look on paper,' he returned. 'Will you join me'—

'God forbid!'

Arcus laughed. 'I meant in drinking to my safe arrival at West Loch Tarbert.'

'I cannot refuse to do that—a very small drop of Scotch, thank you; but'—the middle-aged man laid his hand on the young man's arm—'I wish you wouldn't do it. There was a steamer wrecked in the Sound of Harris the other day, and her captain had passed through fifty times.'

'One is more careful the first time,' said Arcus, and gave the waiter the order.

The other sighed. 'You will excuse an older man's interference?'

'I am much obliged to you,' Arcus replied gravely.

His companion evidently decided that further argument would be useless, for he folded up his map and said, 'I heard a curious story in Rodel. It was to the effect that a man, supposed to be a crazy professor of chemistry, was occupying one of the small islands or rocks in the Atlantic—I can't recollect its name, but it is twenty or thirty miles from the Hebridean coast—and extracting, or attempting to extract, gold from the sea-water. The accounts I obtained were extremely vague, but they may be based on something. I understand there is gold in sea-water, but in the very minutest quantities.'

'I'm no chemist, but I believe it is so,' said Arcus. 'I wonder what his method is.'

'I can't say. It must be a desperately lonely existence out there. I confess my curiosity was excited.'

'Mine is.'

'Ah! in that case I venture to ask a favour of you. You appear to be adventurous in the extreme, and it is possible you may make a trip in one of the whalers, though I understand the hunting season must close soon. Still, you may make a trip; you may see the island I speak of; you may even land on it. May I offer you my card and say how deeply obliged I shall be if you will write me a few lines should you discover confirmation of what I have told you!'

'I will make a point of looking out for the island. I will also make inquiries,' said Arcus, giving his card in exchange. 'You have roused my interest.' He yawned involuntarily.

His new acquaintance rose. 'You told me you had started at daybreak to-day, and are going to do the same to-morrow.' Holding out his hand, he added, 'Good-night, Mr Arcus. Apart from satisfying my curiosity, perhaps you will relieve my anxiety by sending me a post-card on your arrival at West Loch Tarbert. I'm sorry not to have seen more of you. Again, good-night, and a safe passage.' With an inclination he departed.

'Well, he is a nice, friendly chap!' said Arcus to himself, and yawned again.

A newspaper—the *Glasgow Herald* of that morning—was lying on the table. Arcus, who had not seen the news of three days—not that he had craved for it—picked up the paper, yawned once more, and dropped it.

'Must go to bed, or I shall sleep here,' he decided; and, rising with an effort, he proceeded to his chamber. Within ten minutes he was sound asleep.

In the smoking-room another guest picked up the *Herald*. 'Not so bad being able to get a paper of same day up here,' he remarked to his friend, and began to turn the pages idly. Suddenly, 'Good God!'

'What's the matter?'

'Why, there has been a most extraordinary fall in Yankee rails. Regular panic.'

(Continued in following section of this part.)

THE FATE OF MANUSCRIPTS.

By E. BERESFORD CHANCELLOR, M.A.

INNUMERABLE as are the books which have seen the light—have emerged from their manuscript state into the glare of publicity—there must have been, there must be, thousands which have progressed only as far as this first stage, and which have been known only to their authors or to those intimate friends who have been chosen to share in the partly prepared meal. The story of books in manuscript forms, indeed, one of the most interesting phases of the history of literature.

In early days, of course, the relatively few books which the labours of the mediæval monks

produced were in no other form. But what manuscripts many of them were! Hardly a page was without its exquisite illumination; even the chapter-headings would begin with some beautiful initial letter into which a whole history could often be read, and were pregnant with the condensed thought of a generation less hurried than our own, that loved beauty and the production of beautiful things for their own sake and not for the 'rascal counters' which could be obtained for them.

Before the mediæval monks were the classical copyists. Earlier still, the hieroglyphics on the monuments of Egypt and Assyria may be regarded

in the light of almost permanent books in manuscript, as were such later productions as the Persian Chronicle, the Rosetta Stone, and the Nicene Creed, which Pope Leo the Third ordered to be cut in silver. But these things are, after all, hardly what we mean when we think of manuscripts which have never emerged from their writers' studies, or at least have never been reproduced in their thousands as they are to-day. The patient scribe, too, who laboured six hours a day, according to the anonymous writer of those early times who tells us that it was customary 'Membranas *bis ternas* sulcare per horas,' knew that his work was but for the fit and few, and that if his audience was a limited, it was also sure to be an appreciative, one; and in the knowledge was produced the wonderful Book of Kells and the lovely Bedford Missal, in which this labour of the writer was combined with the exquisite resources of the artist.

But it is rather of those unpublished books which have been produced at a later period, and which are now preserved with such pious care in our great libraries, that we think when we talk of books in manuscript—such as are to be found in the British Museum amongst the Sloane, Lansdowne, Cotton, and other lesser collections; or at Oxford, where the Bodleian, the Rawlinson, and the Clarendon manuscripts draw students from all parts of the world. And still more do we think of the labours of those whose industry has been its own reward, and whose 'daily line' has never gladdened their hearts in the form of a rivulet of print flowing through a meadow of margin, as it has been bibliographically expressed.

Luckily for us, many of these delicate and perishable treasures have been preserved in more durable form by the industry and care of others; sometimes the diffident authors have been persuaded to give to mankind what was originally meant but for themselves, as was the case with Browne's *Religio Medici*, written in 1635 merely for the Norwich physician's own amusement. The manuscript was known to various friends, and somehow got into the hands of a bookseller, who published the little book in 1642 without the knowledge of its author, who, in self-defence, was himself obliged to bring out a more correct version in the following year. Sometimes the original manuscript, through accident, has never reached the printer's hands, as was the case with the first volume of Carlyle's *French Revolution*, which, having been lent to John Stuart Mill, fell a victim to that philosopher's maid-servant, and perished untimely in a pre-prandial fire.

Sad has been the fate of other embryo works besides Carlyle's masterpiece! Some have been destroyed by sectarian zeal; some have been lost for centuries through the necessity of hiding them from this very danger, and there is little doubt that the accumulations in banks and lawyers' offices would, if systematically investigated, yield

quite a harvest in literary remains. It is, indeed, curious how much has been recovered from the secret recesses of old houses and the forgotten contents of obscure lumber-rooms. We know that Dr Dee's interesting manuscripts were found in the secret drawer of a chest, and how Thurloe's vast collection of state papers literally fell through a false ceiling in Lincoln's Inn is common knowledge. The shops of grocers have before now given up to the curious inquirer the dilapidated and fragmentary remains of valuable documents; and the chance discovery of the manuscript of Evelyn's *Diary* in an upper room at Wotton forms one of the fascinating incidents in literary history.

Many works have in their manuscript state been saved from fire, but how many have perished in that element it would be impossible to say, and rather sad to have to record. Our rich classical literature is yet not so rich as the ancients themselves left it. Of Diodorus Siculus, Dionysius Halicarnassensis, and Ammianus Marcellinus we might certainly accept with equanimity the *lacunæ* which exist; but that innumerable writings of Tacitus should have perished, that out of Livy's one hundred and forty-two books only thirty-five should have come down to us, while the extant works of such men as Menander, Æschylus, Sophocles, Euripides, and Plautus are really but fragments—mighty fragments as they are—is a thought sufficient to sadden us even after we have become inured to the loss through so many hundreds of years. Who shall tell what was lost to the world by the burning of the Alexandrian Library? Who can enumerate what has perished in other ways—ways due to bigotry or carelessness or the mere lust of destruction?

We have it on record that the descendants of Leonardo da Vinci thought so little of the fame of their great ancestor that they indifferently permitted his note-books to rot in a garret or to become the prey of vermin. Ménage's pathetic *De Bibliothecæ Incendio* was written as the result of a fire which destroyed many valuable manuscripts in his library; on the other hand, the collections formed by Peiresc were calmly allocated by his niece to the furnishing of the grates—a saving in fuel which she supposed compensated for the loss of the literary treasures whose value she did not, or would not, realise. No small quantity of such treasures has gone down into the sea, and the labour of years, the fruit of genius, has rotted beneath the treacherous calm of the ocean, or has been more quickly destroyed by its terrible storms.

But perhaps, after all, the saddest fate that can overtake a manuscript is the poverty of its writer, which sometimes prevents his ever perpetuating it in print, or the indifference of the world, which leaves it in its original destructible form. Occasionally one comes across in second-hand bookshops or in the unconsidered lumber of auction-rooms

some manuscript to which the workings of a long-forgotten brain have given birth and which the love of a long-stilled hand has traced with care. Here you will find an elaborate essay on a philosophy which has been superseded, but which in its writer's eyes, no doubt, would have revolutionised thought had it emerged from its pristine state; there a treatise on logarithms or a diary of travel. Sometimes it is poetry—and often such poetry. It was only the other day that I came across a complete translation

of Dante's epic translated into English verse, and obviously representing the labour of years. Cary and Longfellow need not turn in their graves with envy. But is there not something inexpressibly sad in the thought that so much labour, even if not infused with the true Promethean fire, should have come to this—to be bandied about in its original manuscript in booksellers' shops, and to be priced at a less sum than would buy a copy of Robert Montgomery's poems or Pollok's *Course of Time*?

THE SHIP OF SHADOWS.

By JOHN FOSTER, Author of *The Bernardine*, *The Forgotten Rock*, &c.

CHAPTER XIX.—'PROXIME JIM.'

IT was at the darkening. The night was still, with no sound but the even murmur of the sea. The very landscape seemed fallen on a deep sleep after the long, tiring day. So breathless was the night that my footsteps, though muffled by the thick summer powder of dust on the road, sounded to my fancy strangely loud, calling up faint echoes out of the quiet distance. The village lay in a crease of the hills a mile distant, and about half-way I stopped for a moment on the crest of the road to look back on the darkening sea and the flash of St Bees' light.

As I stood a faint sound in the night grew into footfalls, and the figure of a man appeared. We saw each other at the same moment. It was my acquaintance of the wreck. He came forward to me.

'I—I wanted to see you,' he said nervously.

'And I was coming to see you.' There was an awkward silence.

'Perhaps—if you care to come back with me?' I continued. I saw him hesitate, almost timidly, I thought.

'What I have to say will not detain you more than a few minutes,' he said. 'And we are close to my quarters.'

'As you like,' I answered, and we set off. Neither of us spoke, save in strained common-places. It was a relief when we turned down a side-path, about half a mile from the village, and I saw a square of light shining from a cottage-window in the dark.

'This is where I live,' he said as we neared the cottage. It was an ordinary 'but-and-ben,' whitewashed, thatched, small-windowed, with a kail-garden and a few currant-bushes, flanked by the ubiquitous Galloway 'dry-stane' dike; a dwelling of the very poor.

He showed me in, and brightened the lamp. The furnishings were scanty—a desk and two or three Spartan-looking chairs, no pictures, but the place rescued from bareness and humanised by a gracious array of books that covered the walls of the little room.

He offered me a chair, and then stood opposite me.

'I wanted to see you again,' he began in a steady voice, 'because I wish to ask your pardon for having—lied to you this afternoon at the wreck.'

'Your name is Lennox,' I said on an impulse. He coloured painfully. Then, 'Does it matter much?' he replied; but his careless shrug was not convincing. 'However, that is my name.'

'Mine is Herries.'

'Thanks. What I want to tell you is that the story of *The Ayrshire Rose* is untrue from beginning to end,' he said, looking at me with a straight and inscrutable eye.

'Well, you killed an afternoon most pleasantly for me. I wanted to thank you. Need we discuss it. If you chose to amuse yourself! Pray dismiss it.' I laughed; but he laid a hand on my arm.

'No, you're not going to head me off. I must tell you,' he continued. 'But I want a promise from you that you'll keep what I tell you to yourself.'

'I promise, of course; and don't think me a meddlesome ass if I say that I felt interested after I found out who you were. I'm not here out of vulgar curiosity. My word for it, Lennox;' and I held out my hand.

He shook hands. His voice trembled a little as he said, 'Thanks. I hope—I think you'll understand. When I met you at the wreck I had not spoken to—to one of my own class for a long time. No reason, except the dreadful one that I'm a failure. I've been living here alone, trying to do without friends, except—thank God!—these.' His eye kindled at the rows of books. 'I've stuck it out better than most men—I'm afraid to say how long. Sometimes—one has nerves, I suppose. I fancy that when you met me at the wreck I wasn't quite normal.' He paused, then went on hurriedly, 'Ever try hack-writing for the halfpenny papers?'

'No.'

'Don't begin. I did. Try crossing-sweeping first.'

'Sold cheap what is most dear,' I thought aloud, and regretted it instantly, for he reddened.

'Yes, I suppose so. One must live. I could enlighten some of the smug platform shams about the living wage. I'm on an article just now on "The Enervating Influence of Wealth." It's got to be bright and amusing. Gad! Well, that morning—perhaps there's a subtle freemasonry between wrecks—I went down to the sands. I was moping—thinking too much, I suppose—what-might-have-been, and all that. Useless and cowardly, no doubt. Then you came along. You probably may put me down as light in the head. You can if you like. Only wait till I've done. Whether it was the cigar or the talk that conjured up other times and faces I cannot say; but you—well, you made me feel not quite so out of the running. You brought up Oxford—the men there, the keenness of life, the young voices, the big things we were going to do. The world went very well then!'

"*Ante oculos errant*"—— I began.

"*Domus, urbs et forma locorum.*" Heavens!

Yes, I can see them. Well, when I saw that you knew nothing about the wreck, and wanted to know about it, I determined to bring you back. Sorry, but I wanted badly to see you again. I had the bones of a yarn thought out before I saw you. I was going to try my luck in writing it, so I spun it to you this afternoon. Rather a thick lot of lies, no doubt. I suppose it's falsehood, fraud, and wilful imposition; but I got interested in it, and it ran away with me. I don't know that I'm really sorry, for it gave me a blessed afternoon of creating, an audience, the satisfying of—oh, you can't grasp it unless you've felt it!—a ravenous hunger for something—a holiday from—from my—my chains. I can't explain myself better.

His tragic smile did.

I nodded. 'Go on!' I said. 'I understand.'

'Thank you. There's not much more to tell. Hundreds of fellows have the same story. Oxford,

a swindling trustee, and a sudden loss of money. I had to chuck it. You know what the University man at a loose end is? Then two or three billets I wasn't cut out for, ending up—the limit!—as an assistant in a Secondary School in a small Scottish town, where I had neither privacy nor comradeship. I had a craving for other work. Money, fame, and all that sort of thing may bring pleasure, but not happiness, if a man's heart is elsewhere. Mine was in creative work! To do anything else seemed as futile as chasing'—he smiled—'shall I say a Ship of Shadows? So I turned the Scotch billet up, and I have lived since on faith, hope, and—no, I haven't touched charity yet! So here I am.'

He waved his hand round the little room.

'This mansion is fairly wind and water tight. My neighbours, if Boeotians, are not inquisitive. I am my own master. Nobody ever had a worse servant. Living is not expensive. Peats are positively cheap. I wish they were edible; but I grow my own potatoes, so I'm not quite in the last ditch!' The ghost of a boyish smile flickered for a second. Then, quite suddenly, he broke down.

'Sorry! Better go, Herries,' he said at length.

But I did not go. Some men learn more of each other's hearts in an hour than brothers or husbands and wives do in a lifetime. So it was, I think, with us.

He came a part of the way back with me, and in the hush of that summer night I came to know something of one of the common, unconsidered tragedies of Life's lottery.

My time was running short in the old country, for I had my passage booked for India; but before parting I registered a mental resolve to do what I could for him ere I sailed.

For here was a man born with the golden, burdensome gift of imagination; the hunger for expression, his artistry, as vital as his blood; his mind starving to death, manacled to sordid routine, souring through solitude and disillusion, aching for the glimpse of a bright strand on his gray horizon.

(Continued in following section of this part.)

EARS OF RYE.

By JEAN D'AUVERGNE.

WE British boast that we are the most practical nation in the world, and in view of this preconceived idea we are inclined to think that our charities are unequalled in usefulness and in practicability of organisation. The charities are certainly varied enough, for there is no deserving object, however insignificant, which has not its claim upon our private purse. There are charities run by newspapers, in which both the donors and the newspapers reap the reward of publicity; there are soup-kitchens, presided

over by some member of the aristocracy; theatre matinees, where actresses give their services free; football matches, where the gate-money is devoted to some special object—in a word, all forms of charity which are likely to induce people to spend money.

I venture to think, however, that we have no form of charity so charming or so effective as the Russian Kolos Day.

A kolos is an ear of grain—in the present instance an ear of rye; and Kolos Day is the

day set apart for the selling of little button-holes of rye-ears for the relief of the starving in the famine-districts of Siberia and eastern Russia.

Petersburg celebrated its *Kolos* Day last autumn, when a sum of one hundred and ninety thousand roubles was collected in the twenty-four hours. A few weeks later it was Moscow's turn. Here the day was organised by the local agricultural society, who, with admirable foresight, engaged an army of nearly four thousand young ladies to carry out the work. The method of collecting was simple and effective, and—still more important—cost nothing to arrange. Each member of the four thousand was given a white band bearing the letters 'For the Hungry,' and a round tin money-box. The band she slipped over her blouse, and the money-box she gave to the young student who accompanied her. The buttonholes, to the number of perhaps five hundred, she had made herself at a cost of a rouble or two for the ribbon and the artificial cornflowers.

After all the necessary preparations had been made, each lady was posted at a special station in the town—in the principal streets, in the railway stations, in the theatres, in the banks and large shops, and in the cafés and restaurants.

The selling of these *kolos* was restricted to one day, but every minute of the twenty-four hours was utilised; and on the Thursday night, as soon as the clock struck twelve, every theatre, music-hall, and restaurant was invaded by bands of fair ladies carrying daintily coloured baskets of *kolos*. Some arrived in elegant motor-cars, others in the more humble *izvozzchik*; but all shared the same intense eagerness and the same friendly rivalry to outvie each other in the quest for gold and silver.

On the Theatre Place, outside the Opera House, and even in the corridors of the theatre itself, some fifteen ladies took up their stand, waiting patiently for the clock to strike. Then there began a never-ceasing rushing to and fro. 'Won't you buy a *kolos*?' 'A *kolos* for the starving, please.' The request was made in such a charming and yet determined manner that there was no refusing the fair offerer.

It is only after twelve that the chief Moscow music-halls and restaurants begin to show signs of life, and at Yar' and at Streylna, at the Hermitage and at Praga, a rich harvest was reaped. At Yar', the famous music-hall restaurant of Moscow, the scene was extraordinary. Shortly after midnight a couple of automobiles drove up to the entrance, and a band of *kolos*-sellers—laughing, smiling, pleading, exhorting—invaded the great hall and made their way from table to table through the merry throng of officers and merchants, of students and demi-mondaines. There was a frank abandon in the manner of presenting the *kolos*, and resistance was out of the question. 'Come now! Petersburg raised

nearly two hundred thousand roubles. You won't allow Moscow to be beaten! That will never do.' And at this remark the pride of the Muscovite was awakened, and the rich Moscow merchant dived still deeper into his pockets. In no circumstances could 'the heart of Russia' allow itself to be outshone by its northern rival, and the money-boxes jingled joyously, as though denying even the possibility of such a catastrophe. And so it continued in every café and restaurant until the early hours of the morning.

On the Friday morning the streets seemed ablaze with colour. The sun shone out in warm approval of the day, and at the thought of the coming spring every heart was glad. And yet the streets were not without their note of tragedy. At every corner, as if to remind one of the vital necessity of this charity, were gathered beggars of every description—one-legged, one-armed, blind, deformed, miserable creatures such as can be seen only in Moscow; and there was a grim humour in the fact that the buttonholes should consist of rye, the rye that was so badly wanted in Samara and in Siberia.

Every man, and every woman, and every child, however, wore a *kolos*. Even the street-porters and the newsboys had contributed their dole and sported their sprig as proudly as the rest, while the fat droshky-driver, with the inevitable cigarette between his lips, had decked out his horse with gaily coloured *kolos* ribbons. It was quite impossible to walk ten yards without being stopped. In sheer desperation one would say at last, 'But I've already bought nearly a dozen.' 'Ah, but you haven't a red one yet!' And a red one, perforce, one had to buy.

In Britain business-men hurrying to their work would have been seriously annoyed; but in Moscow no one is ever in a hurry, and everywhere the utmost good-humour prevailed. Then, too, it was a new game for Moscow, and in the novelty and excitement of the pastime one wondered in how many hearts there was any real feeling of sympathy for those for whom all were spending their money so readily.

In the afternoon, although a pretty face met with no refusals, the buyers grew more capricious, and it was necessary to resort to more desperate methods. In the Kuznetsky Most—the Bond Street of Moscow—the crowd on the pavement had been content for some time to crawl along at a snail's pace. In the centre of the street two young girls, assisted by two students, successfully held up the passing traffic and levied their toll. An Englishman drove past in a ramshackle cab drawn by a lean, scraggy horse, whose miserable condition excited the jeers of the crowd. He was duly hailed and forced to stop. After all, the driver could hardly run down two fair maidens who persisted in standing in front of his horse. 'No,' stammered the Englishman in bad Russian, 'I won't buy any more. I've already spent ten roubles.' 'Ah, but you must pay

something for having such a beautiful horse,' came the ready answer. And another rouble clinked against the others in the box.

No means of persuasion were neglected. Every possible source of supply was exhausted. The shop-windows were strewn with bunches of *kolos* to show that their owners had contributed lavishly to the general fund. The railway stations were carefully 'worked,' and all the local trains were boarded. Generals in uniform were held up by young girls of seventeen and eighteen, and did not seem to resent the audacity. Actresses driving to the theatre bought recklessly and plentifully, as is their wont. In the families of the fair sellers there was only one subject of conversation—how many roubles Maria Vassilievna had collected; and mothers related with just pride that their daughters had been standing in the streets for seven and even for eight hours at a stretch.

At last the day drew near its end, and the

streets began to grow empty. A few minutes before midnight, when most of the sellers, tired out after their long exertions, were making their way homewards, a belated traveller would be stopped. 'The last *kolos*. Come now! Buy the last *kolos*. To-morrow it will be too late. Please, just to beat Petersburg.' Once more the never-failing argument prevailed, and in this way a few more roubles found their way into the already heavily laden money-boxes, which were then taken to the Town Hall for the contents to be counted.

For four days the impatient sellers had to wait for the result of their efforts to be made known; but on the fourth day their fears were set at rest. Moscow had beaten the record. A sum of two hundred and thirty thousand roubles had been collected, and Petersburg would have to be content with second place. Moscow had done well, and 'the heart of Russia' had once again established its superiority.

THE DIAMOND SMUGGLER.

By C. EDWARDES.

CHAPTER I.

'I NEVER meant to turn out such a ruffian; but, then, one seldom does, I suppose. And there's this about it in my case: I really will get these men their money back, somehow and sometime.'

Lawrie Beedham smoked a cigarette after this virtuous murmur, and viewed his purple socks, yellow-striped, on the opposite seat of the railway-carriage in which he was being speeded to Liverpool, the Prophet liner *Micah* (already full of steam in the Mersey), and new life in America, with soothing obliteration of the old life.

He thought about Messrs Clearwell, David Jones, and Field, and what they would look like when in a fortnight or so they learned that *they* were the clients whom he had selected to share in his pecuniary misfortunes. It served them right in a degree. They should have been less grasping about their per cents. per annum—especially Archdeacon Field, who knew better than any of them that it is not the thing unduly to accumulate treasure on the earth, where moth and rust corrupt. Their request for a safe 5½ or even 6 per cent. on their five hundred pounds apiece had almost certainly helped to lure him into that specious path of the speculator which had dropped him into an abyss.

How surprised Durnham town would be when the truth came out! The dull, little, red-brick hole would doubtless enjoy its sensations about him. He could hear the paper-boys shrilling the news, see the citizens discussing it at street-corners. Clearwell the provision merchant and David Jones the tanner would probably swear; one couldn't be sure what an archdeacon would

do. Even the London press might find him, Lawrie, worth a paragraph or two in the circumstances. Perhaps it would be 'Extraordinary Conduct of a Dishonest Solicitor,' or some such heading. Thus the whole British Empire would learn that on this present Friday the 15th of June he had left Durnham for a holiday at St Leonard's-on-Sea; that the fears about him when he did not return on Monday the 2nd July became suspicions on the Tuesday, strong suspicions on the Wednesday, stronger still on the Thursday; and that on the Friday his private safe was forced and letters to Messrs Clearwell, David Jones, and Archdeacon Field were discovered informing them that they had each lost five hundred pounds temporarily. There was a fourth letter, for Trevor, his clerk, enclosing a power of attorney to enable him to straighten matters, and giving the assurance that everything was in order except as regarded those three five hundreds. The London press might or might not get hold of the following words from the clerk's letter, and deem them also good copy: 'Whatever I am, Trevor, *you'll* know I'm not a robber of widows and orphans.'

Dismissing his three victims from his mind, Lawrie donned a pair of plain glass spectacles. 'They're a nuisance, but advisable,' he said with a light laugh; and then, still viewing the flitting landscapes as readily as with his naked eyes, he said, 'Let me see now, John Ellis, what we've got to do; and remember that you *are* Ellis henceforth, if not for ever. Golf-clubs and portmanteau left at Rutlington Junction in the name of Simpson; but you needn't remember

that. By-and-by the company will sell them with its other lost stuff, and welcome. That bad egg Beedham is off the stage, anyway; and with no moustache and these blinkers it would take even Aunt Gracie all her time to'—

His jaws stiffened; he frowned at the sunny fields and an ivy-clad, old stone farmhouse, and spoke forcibly: 'Be dashed to it! I am sorry about her; though *she'll* understand.'

Miss Grace Ridley, novelist and intrepid traveller in unmapped parts of the tropics, had, from his first plottings to throw off his chains, been his chief hindrance in the matter. Not in the flesh, for she was still somewhere in Africa. But it was extremely painful to him to contemplate her home-coming to such a blow. Whether she understood or not, it would hurt her dreadfully, none the less that it proved how discerning she was about him. She had always said he was too thorough a Ridley to become a successful lawyer. 'The Ridleys, Lawrie boy, have imaginations, not common-sense, as it is called.' This was one of her gleeful deliveries. Memory shot it at him.

His own mother's share of the Ridley imagination had made her marry his father, a delirious mistake of which they both died rather soon.

Again to quote this intelligent and agile, nut-brown and tailor-made, dear aunt, who in her travel get-up and slung binoculars was the ideal of a shrewd lady bookmaker, not writer: 'Yes, Lawrie, your poor mother's life was a sad mess; but she could no more help it than a bird can help flying, I think. I'm the luckiest of the family so far, because, you see, I determined to specialise in my imagination, to live on it and for it as long as it lasts. It's the specialist's century, this twentieth, Lawrie. That's how I earn so much money—all yours when my imagination dies. I shan't survive my imagination, Lawrie, and you may make a legal note of that truth if you like, my dear.' *What* would she say and think in the first crushing hour or two after her next return to Durnham?

The train stopped, and an official exclaimed, 'Tickets, please!' before Lawrie could shake off the depression of the problem.

'You may call it Liverpool, sir, though it's Edgehill,' the ticket-collector said in answer to his question, promptly awakening the more cheerful and practical elements in his mind.

In the next hour he visited a barber, and with a crowd of others boarded the *Micah*. It was a lovely night, even on such a river as the Mersey, and Lawrie forgot everything and every one, including Aunt Grace, under its passing spell.

The steward—who took his shipper's receipt and pointed him to his cabin—was flustered and perspiring; and as he was seized the next moment by an American lady with three chattering daughters, Lawrie didn't see him again until an hour later, when the *Micah* was hastening towards Ireland. He pushed an anxious head into the

cabin and said, 'Oh, sorry, Mr Kramm! It's all right, sir,' and didn't tarry for an answering word.

Kramm was Lawrie's stable-mate. The lower of the two berths, No. 95, was his; and the mean little portmanteau of gray canvas, with his name on the label, which occupied that lower berth was the only local indication of him hitherto. Lawrie had waited about for Kramm partly from curiosity, partly because he was not yet used to the spectacled and unmoustached new self which the cabin mirror introduced to him, and also because he envied Mr Kramm his lower berth, and proposed to suggest an exchange. The common article of luggage hinted that Mr Kramm was a person of little importance in the world. He might, therefore, be simple and obliging.

At length Lawrie went on deck and diverted himself. Durnham and Lawrence Beedham, as an admired young rising feature of it, were far in the background. It was a psychological mercy that he could live those next two or three hours engrossed by mere surface interests. He gossiped at random, took stock of the first-class travellers aft, mingled in friendly fashion with the third-class crowd forward, and hoped there would be a decent second-class dinner. He rejoiced in the salt air, the blue sky, the sea, and the charming display of the Welsh hills; and until the first dinner-bell he had nothing to remind him that after thirty-two years as Lawrence Beedham he was now an *alias* John Ellis, with little more than a change of linen and pyjamas in his handbag. The Ridley imagination was doing helpful work in him.

But the cabin and the Kramm portmanteau brought him to earth again. He washed, and brushed his hair; and still the only sign of Kramm was that portmanteau.

Then the second bell rang; and, responding to it, he collided with his flurried steward.

'Your table number is the same as your berth, sir—ninety-five; and the other gentleman of your cabin sits next to you,' gushed the man.

'Thanks,' said Lawrie; 'but I haven't seen the other gentleman.'

'He'll be in the saloon, sir, no doubt,' said the steward, and passed away.

But Kramm was not in the saloon, and Lawrie dined between a vacant chair and a Boston dry-goods merchant named Read; and the dinner was in the Irish stew stage when it chanced upon him almost excitingly that the only part of Mr Kramm on the *Micah* might be his portmanteau. The table-steward also addressed him as 'Kramm,' and assumed that Mr Ellis was the absent party. Lawrie found it amusing, especially when the dry-goods merchant said that perhaps Ellis's stomach was delicate his first day at sea. They would laugh together about that, he reflected—he and Kramm—if Kramm showed up and proved a con-

genial creature. Meanwhile he continued to be Kramm, paced the deck with Dry-goods, and accepted a cigar from him, still as Kramm.

But at half-past ten he left the sea and stars to themselves, and went downstairs; and, having removed Kramm's portmanteau to his own bunk, slept soundly in Kramm's bed, after a few vivid conjectures about his missing mate which he didn't think it worth while to ring up the steward to impart.

At seven o'clock the next morning the steward brought him some tea and said straightway, 'Mr Ellis has got left. Must have gone ashore again for something after giving me his ticket. Perhaps his luggage went astray, and he after it. You'll be by yourself this trip, Mr Kramm.'

'That's so!' said Lawrie.

'Seems like it, sir. I can't even remember the gent. We're leaving Ireland behind us nicely.'

'Are we?' said Lawrie.

'Yes, sir; and breakfast's from eight to nine.'

'I'll remember,' said Lawrie; and, alone, he sipped his tea and mused until he felt compelled to rise and examine Kramm's portmanteau. Outside, it told him nothing fresh except that it had been lately at Rotterdam and Liverpool Street. It had a loggy feel, however, which made him inquisitive about its contents.

He washed and dressed and breakfasted, and was 'Mr Kramm' persistently to the dry-goods merchant and the table-steward, and afterwards smoked and leaned over the rushing green-and-white water, and saw no harm, and glimpses even of providential arrangement, in his definite acceptance of Kramm's personality till he reached New York.

The Ridley imagination was stimulating on the subject. It didn't intrude about Kramm's portmanteau with more than a reminder that when they were in the Hudson it could be shoved out of sight and abandoned. He ought to have thought of communications from Kramm by 'wireless,' but didn't until the Sunday, which seemed comfortably too late for such trouble.

Still as Kramm, therefore, Lawrie attended evening service in the *Micah's* chief saloon. He had his metaphysical moments, like every one else. Monday and Tuesday passed serenely; but on Wednesday the weather was cool, with a dim white sun.

'Icebergs from the North Pole, Kramm!' Dry-goods explained at table.

'You don't say!' said Lawrie.

But Mr Read did say. Furthermore, he said Lawrie might hope for a sight of the bergs themselves unless the haze thickened; and that afternoon Lawrie kept his eyes open on deck for the spectacle.

Instead of icebergs, however, he saw some one in a deck-chair in the first-class part of the *Micah* who made him pull off his glasses to make sure, and then hurry down for a passengers' list.

He read the name 'Miss Ridley' in the list with a sense of heart-shock such as even a 'wireless' about Kramm could not have given him. Aunt Gracie on the *Micah*! Of all souls—she!

There could be no possible doubt about her either. The old brown ulster, the deer-stalker in which she had interviewed African kings, her daring way of resting the ankle of one knickerbockered leg on the knee of the other—these were hammering evidences although her face had been hidden from him.

Lawrie was a silent man at dinner that evening.

Dry-goods found him so disappointing that at length he hoped his liver was well. 'Then maybe it's your conscience, Kramm?' he tried next, with a smile that seemed as impertinent as his words.

'It's my neighbour, sir,' said Lawrie, stirred by that chance home-thrust; and, having slowly digested the affront, Dry-goods said, 'All right, young Mr Kramm; all right, sir!' and there was an end to conversation.

Lawrie kept himself to himself thereafter until bedtime, pacing in the growing gloom of an unseasonably early and clammy night without the glint of a heavenly star to it. But he felt calmer when his pacing was over. Whether Aunt Gracie were bound for the Rockies or a blistering bare spot of Mexican territory which she had chosen from an atlas for exploration purposes, it meant a blessed reprieve for her from the Durnham blow. Much might happen in the meantime. He might strike something sudden and rich whereby it would be a case of almost 'as you were' when next she opened her arms to him with her usual sunburnt smile and warm-hearted, 'Well, Lawrie boy!'

But this fond castle in the air was scarcely up ere it was down.

He was going below, when he was stopped by a young bore named Powell. 'I say, Kramm, this is jolly rotten, isn't it?' he was asked.

'Very jolly rotten indeed!' said Lawrie.

'Good-night. I'm turning in.'

'She's playing Jonah to the cods by now, I bet, poor wretch! Jonah in pieces, though, which makes the diff,' proceeded Powell.

'I don't understand you,' said Lawrie.

'No? Not heard? A first-class lady missing. Last seen making notes in a dangerous position right aft. And it's nine hundred to one she's slipped in. A Miss Ridley. Her book and knitting were on a chair; but she, alas! was no longer there. Poetry, Kramm!'

Lawrie caught him by the arm. 'What are you blithering about?' he gasped. 'Drowned!' 'Drowned and eaten by the cods, any odds, Kramm. And that's enough pinching, old chap.'

'Ridley, you say?' But Lawrie didn't wait; he ceased pinching, and staggered below.

'Yes, sir; too true,' the steward told him in

the corridor. 'A writer of books, Mr Kramm, the purser says—very entertaining books. Such a pity! It casts such a gloom—the loss of a passenger. We're two short on the tally now—one first and one second. I mean Mr Ellis, sir.'

A night of wild thoughts and agitations followed. Lawrie came to cursing Fate. It seemed to him that Fate had given him this knock to punish him. Smashed him up retributively. He tumbled out of bed twice to look moodily at the outer blackness and the lamp-lit sheen of the ocean. Fate was mad if it reckoned to benefit him by such a whipping. The Ridley imagination was fierce in him, and when he slept his brain continued its riots on that frantic theme.

He was awake and staring at the wire heaven of his bunk when the steward entered with the tea. 'Any news of her—Miss Ridley?' he asked hoarsely and immediately.

'No, sir; nor ever will be. She's written off,' replied the steward.

'Hard luck!' said Lawrie. 'But so we go on, Griffiths!'

The steward said dolefully, 'We do indeed, sir,' and went; and straightway Lawrie arose and forced the lock of Mr Kramm's portmanteau and examined its contents. His early cogitations had brought him even to this. With Aunt Gracie gone, what the devil cared he what he did? Kramm might be as dead as the dear aunt herself.

Kramm's travelling properties were a disappointment—absolutely; yet not very keen. There was a torn navy-blue cotton nightgown that would have disgraced the steerage. His hair-brush was clotted with grease and hairs. Two respectable white shirts and some clean collars were the only articles Lawrie looked at patiently. And he laughed in supreme derision of himself and Kramm when he had unrolled from several strong-smelling linen cloths the two *pièces de résistance* of the portmanteau—a couple of Dutch cheeses with purple scalps. Enfolded with one of them was an unsealed envelope addressed, 'Miss Anna Kramm, 24 Lexington Street, Ninety-eight Street, Brooklyn,' which,

still without scruple, Lawrie opened; and within was a card which he made out to be a blank bill-head of the Logement de Zeven Provincien, of Ondeschild, Texel, and on it were these words:

'MINE DEAR COUSIN ANNA,—I send to you by Henrik two of the father's best quality cheeses which was to have gone to Alkmaar market to-morrow; but I tell him no, they shall better go to America with Henrik. When you are eating them, please think of me on the old farm "Little by Little," where you were so happy when a child. I write no more because Henrik shall tell you everything. Have I not learned my English pretty good? Until the next year then, with much kiss, JAN.'

Lawrie tore up the card and cast the pieces through the porthole; the envelope, for no reason he could have given, he pouched in his pocket-book. Then, having put away the portmanteau and its rubbish, he washed and dressed and renewed his simple life as Kramm. He apologised to Dry-goods for his rudeness the previous evening, and was forgiven. No one seemed to notice the change in him, and there were times when he smiled grimly to himself about the convenient blindness of his fellow-creatures. His Durnham misfortune had taught him something of this, but the drowning of Aunt Gracie carried him much farther. This was like a definite burial of his past. Messrs Clearwell, Jones, and Field had small chance now of profiting by any of those righteous hopes of ultimate restitution which had brought him to the *Micah* with an upright head and a light heart in spite of all.

He needed no more proof of Aunt Gracie's identity with the vanished Miss Ridley, yet some was given. She had reached Liverpool by a West African steamer on the Friday morning, and was making this instantaneous crossing to New York to compare notes about tribal folklore with a Boston specialist in such studies. It was just the freakish, rapid kind of thing she loved to do.

(Continued in following section of this part.)

PROGRESS OF THE GAS INDUSTRY.

LORD KELVIN said, in connection with the centenary of gas-lighting in 1892, that just as gas had succeeded without snuffing out the sun, the moon, and the planets, so he believed that electricity would succeed without snuffing out gas. If those connected with the gas interest would do as much for the electric light as the electric light had done for gas, the fortunes of many would be made. Instead of being quenched, the gas industry has gone up by leaps and bounds since the introduction of electric light, mainly

because of the widespread use of the incandescent mantle, and through the utilisation of gas for heating, cooking, power-supply, and other purposes. There may yet be many other interesting and useful developments in the use of gas for the service of man.

A gas engineer contributed to these pages in 1904 a paper on 'Some Aspects of the Gas Industry,' which was a wonderful record of progress until that time. Mr F. A. Talbot in 1909 related 'The Romance of the Incandescent

Mantle.' The conference of the British Commercial Gas Association at Manchester last October and a successful Gas Exhibition held in Edinburgh in the autumn of 1912 again brought the industry into prominence. The points emphasised in dealing with the subject are usually those of comfort and economy: the absence in a gas-stove of dust and dirt as compared with a coal-fire, and by use of cookers the saving of time and temper on the part of cooks and housewives. Gas may be turned on or off by the pneumatic method as easily as electric light. It pierces a fog by its radiance much better than electricity. Gas cookers are in growing demand because of their steady heating qualities, and they roast, boil, and bake with ease and certainty. As to the hygienic side of the question, we record a professional opinion later, that of Professor Vivian B. Lewes, who gives reasons for holding that electric light in small rooms and large places of resort is more inimical to health than gaslight. The prejudices of doctors seem to be largely overcome, as there are many gas-fires in Harley Street, London, and in hospitals and dispensaries.

For the sake of those who may have forgotten, it may be worth while glancing back at the beginnings of the use of coal-gas for lighting purposes in this country. Its first introducer was William Murdoch, latterly spelled Murdock, a Scotsman, born at Bell's Mill, near Old Cumnock, Ayrshire, on 21st August 1754. He was trained as a millwright, and afterwards found employment with Messrs Boulton & Watt at Soho Foundry in 1777. This firm sent him in 1779 to look after their pumping-engines near Redruth, in Cornwall. In the process of coke and tar making at Lord Dundonald's ovens at Culrose, in Fife, in 1785, the gas there generated was treated as a waste product. Professor Minklers, of Louvain, had produced gas from bones about the same time for ballooning purposes. Murdock's share in its development for lighting led to a revolution. As a boy he had distilled coal-gas from coal put into an ordinary teapot. While he was smoking by the fire in his cottage at Redruth, the gas issuing from the burning coal again drew his attention to the subject. He made what has since been a common experiment, and transferred a piece of coal to the bowl of his tobacco-pipe, closed the top, and ignited the gas which escaped from its stem. He continued on a larger and more practical scale his experiments in the making and purifying of coal-gas, and had an iron retort erected in his back-yard. From this retort the gas was conveyed in a lead pipe, through his window-frame, up to a point near the ceiling of the room and just over his table. This pipe was seen by an inhabitant in 1872. Murdock also burned gas outside from a bladder with a pipe or nozzle attached. His employers, Boulton and Watt, in 1794 threw cold water on the proposal to take out a patent for this use of gas. It was not considered by James Watt a fit subject

for a patent. In 1803, however, the Soho Foundry was lit by gas, and gasworks were then established. A patent had been taken out by Murdock in 1791 for the treatment of coal-tar; and so he may be said to have begun the series of processes crowned by the discovery by Perkin of aniline as a by-product. He also made one of the earliest locomotives. There is a bust of Murdock (who died in 1839), by Chantrey, at Handsworth, and another in the Wallace Monument, near Stirling. Sir Richard Tangye placed a granite slab on Murdock's cottage at Redruth, which bears this inscription: 'William Murdock lived in this house, 1782-98, made the first locomotive here, and tested it in 1784; invented gas-lighting, and used it in this house, 1792.'

The famous Dr Thomas Chalmers, who attended what he called a badly rendered lecture and exhibition of gas-lights at Pall Mall, London, in 1807, concluded 'that with proper precautions gas will succeed.' He caused gas-pipes to be laid in his new manse at Kilmany, in Fife, in 1810. Though he made gas in a fire-place, no installation was ever established in the village. Sir Walter Scott, it may be recalled, was chairman of a company for improving the manufacture of oil-gas. He had gas installed in that romance of stone and lime, Abbotsford; though Lockhart, his son-in-law, condemned his working at night under a flare of gas when in his later years his strength was failing. In Tennyson's 'Palace of Art' we have the line, 'She lit white streams of dazzling gas.'

We need not follow this early history further than to say that a beginning was made in the lighting of London streets with gas in 1813, Great George Street and Westminster Bridge being the first to have installations. Companies for providing gaslight were started in Edinburgh and Glasgow in 1817. Now the Scottish capital has about four hundred and forty miles of gas-mains; Glasgow has a larger mileage; Manchester has nine hundred and forty-eight miles; Liverpool, nine hundred and eight; and Dublin, six hundred and forty-three, each serving large and growingly important areas.

At the Edinburgh Gas Exhibition held last October there were shown up-to-date appliances for efficiently and economically using gas for lighting, cooking, heating, power, and other domestic and industrial purposes. The high and low pressure gas systems of lighting were seen in operation. It was claimed that over one thousand candle-power is now procurable from one pennyworth of gas. There are close upon one hundred thousand consumers in the Edinburgh area, and over thirteen thousand cookers have been fitted up by the Gas Commissioners free of expense to the users.

In this connection the manufacture of mantles by the various incandescent light companies is now an enormous industry. In the Welsbach process the first stage of manufacture consists in knitting

the fabric or hose which forms the basis of the mantle. The thread used is made either from fine sea island cotton or from ramie, a species of China grass. The fabric undergoes a thorough washing, chemically and mechanically, and is subsequently dried, and cut into lengths of about eight inches for mantles of the usual household size. It then undergoes impregnation in a solution of nitrates, just sufficient soaking being given to fill the fibre without destroying the vitality. This is followed by its being passed through rollers, which serves both to squeeze the fluid uniformly into the fabric and relieve it of superfluity. The upright mantles are stretched over glass moulds and rapidly dried, and thereafter the tops undergo a further process of dipping in order to strengthen the heads, on completion of which the suspension loop of asbestos thread is added. After undergoing a shaping and seasoning process, the mantle, which at this stage is merely a skeleton of fibre, has to be toughened to render it transportable. This toughening is effected by dipping the mantle into collodion, a thin film of which remains on it. The mantle is then dried by hot air, after which it can be safely handled. In the course of manufacture the Welsbach mantle passes through no fewer than twenty-two distinct operations. Both upright and inverted mantles are produced in this way.

Although gas cooking was advocated in the later 'fifties of last century, it is only within recent years that we have witnessed the rapid growth of the system. James and Thomas Sharp of Southampton and Northampton (of whom the former lectured in many places on the subject), and Mr Alfred King of Liverpool, were all pioneers. Their inventions were at once practical and useful; although tinplate has given place to cast-iron in the construction of the apparatus. M. Jules Gouffé of the Paris Jockey Club recommended in 1888 the gas kitchener for its regular and continuous heat, and regretted it was so little known. The introduction of double-case stoves with packed sides and double-cased tops was important in regard to retaining the heat. The iron plate known as a heat distributor for top burners and gas-rings is also useful. There is, too, one for fitting into the interior of the gas-oven. An acetylene oven range was one of the novelties at the Edinburgh Gas Exhibition.

Mr Corbet Woodall, president of the British Commercial Gas Association, has said that an examination of the small cottages in which the labourers and poorer mechanics of our towns live would show one thing clearly—that decent cooking is practically impossible with the apparatus provided. Among the social needs of the day the knowledge of cookery by the wives of our workers holds a chief place. Surely with school lessons for the girls, and all the other helps, there ought to be less waste and more comfort.

There is a mighty difference in the clear atmosphere over Rome as compared with the murky air

hanging over Glasgow. But much is being done in the cause of smoke abatement. It has been stated that sixty tons of soot pass into the air every day from Edinburgh chimneys; from those of Leith about eighteen tons. A great deal has been said and done in different parts of the country in connection with smoke abatement, and the city of Glasgow has done much pioneer work in the crusade against the smoke evil. Smoke abatement exhibitions have been held and lectures have been delivered during the winter months to educate the public in the benefits to be derived from the adoption of the smokeless methods of heating and cooking. The gas department of Glasgow, one of the largest undertakings in the hands of the civic authorities, under its gas engineer and general manager, Mr Alexander Wilson, M.Inst.C.E., has done much to develop a broader and deeper interest in the use of gas for domestic and manufacturing purposes. In 1885 gas cookers were first given out on hire in the city, the number then hired out being over two thousand. Fifteen years afterwards twenty-one thousand and fifty-three were in use; and in 1910, when prepayment-meter gas-consumers were in receipt of a free gas grill or cooker, the number of cooking appliances on hire and loan had reached the large total of about sixty-eight thousand. In 1910 a system of hire-purchase of gas-fires was inaugurated to help in the smoke abatement crusade that had been begun in the city, and at the end of that year about two thousand gas-fires were installed. In 1912 it was decided that on and after 1st March all gas cooking appliances should be given on loan (free of all charges) to both ordinary and pre-payment consumers, and that from the 1st June onwards gas-fires and other heating appliances should be let out on 'simple' hire terms. The results have been phenomenal. Since the beginning of last March upwards of fifty thousand orders have been received for cooking appliances on the hire system, which now brings the total cooking appliances in use belonging to the department up to about one hundred and forty thousand, an increase of over seventy-two thousand in two years. In heating appliances a similar record has been established; the smoke abatement exhibition held in September and October being no doubt a splendid medium for bringing the advantages of smokeless heating before the public. The number of orders received for gas-fires and radiators on the hire and hire-purchase systems during the three weeks of the exhibition amounted to over three thousand five hundred, which brings the number of heating appliances on hire and hire-purchase up to the grand total of about nine thousand, an increase of nearly seven thousand appliances in two years.

Professor Vivian B. Lewes, of the Chemistry Chair, Royal Naval College, Greenwich, and chief superintending gas-examiner for the city of London, discussed the hygienic aspects of gas for heating and lighting before the Commercial Gas

Association. He found from experiment that when a room was lighted by two Welsbach 'C' burners and mantles on a pendant, each consuming four cubic feet of gas per hour, the air at the breathing-level in the room was far purer and fresher than when three sixteen-candle incandescent electric lamps were used, and that the result became the more markedly in favour of gas the larger the number of people in the room. The cause of this difference in favour of gas was that the strong uprush of heated products of combustion from the gas-burners drew up the emanations from the skin and lungs of the occupants, charred and sterilised any germs that accompanied them, and reached the ceiling at a temperature twelve degrees higher than when electric light was employed. The heated air diffused through the plaster so rapidly as to draw fresh air into the lower portion and create a brisk draught under the door of the room, and, while so diffusing, filtered off the charred remains of germs and organic matter on the whitewashed ceiling, thus giving the blackened area which always occurs on the ceiling above the gaslight in town air. Professor Lewes believes this marks the beneficial work of sterilisation that the gas-flame is carrying on, and not, as the advocate of electric light always insists, imperfect combustion.

It is upon this power of setting air in motion and promoting diffusion that a good deal of the hygienic superiority of gas as an illuminant is based; while the sterilising effect of the flame and the trace of sulphurous acid in the products produce the reduction in organic matter and bacteria. In referring to gas-fires the professor said that we

can achieve the warming of our rooms not only under conditions every whit as hygienic as with a coal-fire, but at a cost which is practically the same, as when coal is burnt in an open grate only one-fifth of the heat-units present in it are conveyed to the air of the room. With the modern gas-stove nearly four times as great an efficiency can be obtained. The balance in cost is amply made up for by the cleanliness in use, the absence of dust and the lessened labour in the supply of fuel to the coal-fire, and the economy in lighting. The efficiency of the stoves has been so greatly increased that some 80 per cent. of the total heat in the gas is utilised, so that in heating effect the gas-stove is far superior to the coal-fire. In the best modern stove the radiant heat has been increased to the maximum attainable. The displacement of the coal-fire by the gas-stove, as we have seen in the case of Glasgow, has been urged by those who are labouring for smoke abatement in our large cities.

The award of the Nobel prize for physics last year, amounting to seven thousand seven hundred and twenty pounds, was conferred on M. Gustaf Dalén, chief engineer and general manager of the Gas Accumulator Company of Stockholm. This company owns his system of coast and buoy lighting by means of compressed acetylene. By using the Dalén flash apparatus an economy of gas consumption up to 90 per cent. is attained. This flash apparatus automatically shuts off the flow of gas at sunrise, and at dusk lights it up again. Dalén is the inventor of the 'Aga' flash-light used in railway signalling, and makes an apparatus for lighting railway cars.

THE GERMAN EMPEROR AS A COUNTRY SQUIRE.

By GEORGE ADAMS.

LITTLE is known of the German Emperor as a squire, yet this is one of the most striking aspects of his interesting personality.

Elbing, now a centre of German shipping and shipbuilding, is in the district of Danzig; and between Elbing and the Frisches Haff and the Baltic stand the village and the Imperial country seat of Cadinen. Both are at a point where an alluvial plain ends at the foot of a range of hills. Three well-kept roads run from Elbing to the village. One of these, unusually wide, lined with fine trees on each side, and almost monotonously straight, is used by the Imperial family. Tourists, however, usually avail themselves of a narrow-gauge railway running from Elbing to the outskirts of Cadinen. It is longer, but cheaper.

The village is soon described. It consists of a cluster of small, scattered houses and cottages without any pretensions to beauty, and surrounded by gardens. The inhabitants scarcely number three hundred and fifty. Nearly all the

men and many of the women are in the Emperor's service. A few yards from the south side of it is the main entrance to the Imperial park, between two pillars surmounted by the shield of the Counts of Schwerin, once owners of the property. A short drive brings you to the house, known as the castle. At first sight the latter may disappoint those who had expected anything similar to some of the stately seats of the nobility to be found in the British Isles. It answers more to our idea of a hundred pounds a year residence anywhere within twenty miles of London than of the estate of a sovereign ruling sixty-five millions of subjects. Partially rebuilt in the style of the early nineteenth century, it consists chiefly of a high basement, one floor, and a roof two storeys high, the upper one being very slanting. The imposing arms of the Counts of Schlieben, at one time lords of the manor of Cadinen, in the gable over the portal, are all that give the building anything like a princely appearance. The widest frontage

is three hundred and twenty metres. The halls and inner appointments, the rooms and offices, are comfortable and tasteful, but plain, and in some instances extremely so.

For more than seventy years the park has been open to all the people of the countryside. It is much under a quarter of a mile long. In some places its width does not reach two hundred yards. A part of it is in the plain; the greater portion, however, lies on the declivity of a range of hills rising to over two hundred feet. At one end, not far from the castle, is a fruit-garden; at the opposite one a vegetable-garden, with beehives and trout-tanks. The pleasure-grounds round the castle are laid out in the old French style.

Practically every kind of tree known in the northern half of Europe is abundantly represented in its finest stage of development. Perhaps the most interesting is an oak probably a thousand years old. It has a circumference round the trunk of twenty-seven feet six and a half inches (8·64 metres). In the lower portion is a cavity large enough for eleven soldiers in full war-equipment, and closed by a large wooden door. The park offers a delightful combination of alleys—several of them lined with hundred-year-old chestnut and beech trees—grass plots, clumps of flowers, arbours, basins, ornamental fountains, columns, statues, &c. There is a large arbour, called the Students' Arbour because in former times university students and other bodies held their annual revels there. Rows of white beeches on both sides of it form a kind of natural theatre, where performances formerly took place in the open air. The grotto, too, and the terraces laid out one above the other, deserve notice.

Beauty is the characteristic of Cadinen and all the surrounding country. The whole region is beyond dispute the most picturesque in all north-eastern Germany. Much of it has been described as a sort of miniature French Switzerland. Such a medley of hill, mountain, rock, ravine, forest, valley, plain, delta, winding river, lake, town, village, hamlet, sandbank, indented coast, and sea is hardly to be found anywhere else. None but a master brush or pen can reproduce it adequately. It lacks, of course, the rich, warm colouring of the south. But the northern sky, the dark-green, almost black, woods and forests so familiar to those who know Germany, and the glorious Baltic Sea rippling gently under the sun's rays in summer and lashed to tempests and carrying huge drifts of ice and snow in winter, give to the varied landscape a majesty peculiarly its own. If you wish to have a good idea of it all you must climb to the top of the Kloster Berg, more than two hundred feet above the plain, and just outside the Imperial domain.

Nor are legends and rich historical associations wanting to add to the enchantment of the scene. The valiant Teutonic Knights, Polish kings and nobles, and other personages who have faded

away into the dim mist of ages take an important place in the earlier history of these parts. Nearly at your elbow stand the carefully preserved ruins of a famous Franciscan monastery. It held many square miles of land, possessed vast treasures, and enjoyed a sanctity that spread far and wide. Thousands of pilgrims repaired to it yearly. The three strange and weather-beaten columns standing next to the village, with their mutilated statues of saints and empty niches, mark the point where the pilgrims were lined in procession before they entered the precincts of the monastery, singing hymns and carrying lighted candles.

The Emperor and his family arrive without much pomp. Crowds of people, of course, assemble. The local authorities offer their welcome. For some distance down the road the school children in their Sunday clothes are drawn up in two lines by their teachers; they carry small flags, chiefly black-and-white. When the big, yellow Imperial motor-car appears in sight the flags are waved amid lusty shouts of '*Hoch! Hoch! Hoch!*' and that is all. The coming of the distinguished party is the prelude to open-air concerts, balls, and other amusements.

William the Second identifies himself completely with his surroundings. His thoroughness, ability to go into the smallest particulars, and bluff and genial manner have won for him golden opinions. His Empress is even more popular, if possible. The Emperor, smoking in the alleys of Cadinen, his big German pipe filled with very coarse-cut tobacco and dried cherry-leaves, is vastly different from the one conjured up by popular imagination. As a landlord and employer he leaves little or nothing to be desired. Views differ considerably regarding his capacity as a soldier, sailor, statesman, and many other things; but no man who has visited the Imperial estate will care to contest his powers as a farmer, cattle-raiser, and china manufacturer. Since inheriting the property shortly before Christmas 1898, he has effected great improvements in various directions. Many of them took long and were costly, but the results they have already yielded do full credit to his business acumen and spirit of enterprise. Still further improvements are in contemplation and in course of execution.

SUN AND SEA.

THE wild, wide sea, with heaving swell and dip,
Calls through the darkness to the coming day;
The bell-buoys off the harbour reel and sway,
The wet tongue strikes the curled, cold metal lip,
Homeward and outward bound boat, barge, and ship,
Warning of peril in the strait seaway.
The high light on the cliff fades o'er the bay
Against the sun's light on the salt white drip
That falls off slowly from the rock's black side,
As the waves fall back on the receding tide
To greet the daybreak, and the whispering surge
Rolls eastward to the sun; the billows free,
By thousands, through the surface plane emerge
To hail the meeting of the sun and sea.

CHARLES WHITE.

Chambers's Journal

SEVENTH SERIES

AIR-CRAFT IN WAR.

By BREECH-SCREW.

THE far-reaching results of successful reconnaissance in war were fittingly summed up by Frederick the Great. 'If,' said he, 'we had exact information of our enemy's dispositions we should beat him every time.' Nowadays every commander in the field hopes to obtain this 'exact information' by means of his flying corps. Until recently a General relied mainly on his cavalry for intelligence duties, but the information he obtained from this source invariably related to events several hours old. The great speed of air-craft has changed all this. His flying squadrons can also be used by him for purposes of offence—namely, bombing; for communication by means of wireless, or signalling between the widely extended wings of his army; and last, but by no means least, for observation of artillery fire. Darkness, fog, and perhaps very stormy weather, these alone will prevent his air-vessels from viewing every disposition and movement of his adversary.

During the war in Tripoli the Italian aeroplanes made reconnaissance flights daily, and the materials for the map of the Tripolitan region were mainly obtained from photographs taken from dirigibles by Italian observers. The Italian Government evidently appreciate very fully the value of air-craft in war, for they intend to form before the end of this year twelve squadrons of aeroplanes, and have already ordered three new dirigibles. For purposes of defence and communication, Italy is also expending over a quarter of a million on establishing a chain of hydro-aeroplane stations round her coast. There are to be twelve of these stations, from ninety to one hundred and twenty-five miles apart. In July 1912 it was announced from Milan that her dirigible M. 1 was equipped with two machine-guns, several bomb-discharging appliances, and a wireless installation. The range of aerial wireless telegraphy is at present only from three hundred and eighty to four hundred and thirty miles.

In the Balkan war, unhappily not yet ended, two aviators were killed by rifle-fire. Dr Jules Constantin was the second to meet his death in this manner. He was struck by a bullet while endeavouring to drop bombs on the Turks at Chatalja, but had sufficient strength left to steer his machine toward the Bulgarian camp, near

which he was found dead. The wings of his biplane were riddled with bullets. The Bulgarian aviators made daily flights over the besieged Adrianople, and were able to report the result of the fire of their artillery, and to observe every movement in that city.

During the French army manoeuvres of 1912 forty thousand miles were covered by her fleet of aeroplanes, and there were no accidents.

For purposes of war on sea and on land, each form of craft has its own special duties; but the dirigible is at present the form best suited for offensive action. As compared with the heavier-than-air machine, the dirigible has a larger radius of action, a greater carrying capacity, and it can remain motionless in the air by its engines being stopped—a risky proceeding in the case of the aeroplane. The heavier-than-air machine has the advantage over its larger and more expensive rival in speed, handiness, comparative invulnerability, the height to which it can rise, and in its power of flying under bad weather conditions. At Tunis, last December, M. Garros, in his Gnome-Bleriot monoplane, flew to a height of nineteen thousand feet. At Issy, in June 1912, the Astra dirigible *Eclairneur Conte* rose to ten thousand feet, a record for lighter-than-air vessels. The dirigible has never reached a speed greater than sixty miles per hour; M. Vedrines has accomplished a speed of one hundred and eighteen miles per hour on an aeroplane fitted with the 'integral propeller.'

The aeroplane, by overtaking the dirigible, flying above it, and dropping hand-grenades, explosive rockets, or bombs upon its envelope, can in this way bring about its destruction. But so far as ships and fortresses are concerned, the dirigible, on account of its greater carrying capacity, and owing to the fact that it can remain steady in the air, is able to direct on the object of its attack a far more formidable and better-aimed fire than can the heavier-than-air vessel. The larger dirigibles can carry a supply of ammunition weighing from one to two thousand pounds.

The dirigible, as the larger and the slower moving of the two machines, affords the gunner an easier target. Its envelope, too, is filled with an inflammable gas; but, doubtless, in a few years such a gas will not be used.

Experiments recently conducted on the Continent show us that on a moderately calm day there is no reason why a large and steadily moving airship, with good sights, should not be able to drop 50 per cent. of its projectiles into a circle of twenty feet diameter from a height of two thousand feet. The projectiles used are high explosive shell and shrapnel. The striking velocity of shell let fall from air-craft must be very small—namely, thirty-two feet per second of flight; though in the case of shrapnel the striking velocity of its bullets will be increased by the bursting charge in its base. It may be regarded as certain that in the near future every military dirigible will be armed with either a gun using compressed air as a propellant for its projectiles, or some light weapon of high velocity with a shell of five or six pounds weight. These pieces will be used for its own protection against other dirigibles or aeroplanes, or perhaps one will be carried for that purpose and one for the attack on ships and fortresses.

The effect of explosives dropped from an air-ship is generally greatly exaggerated. A dirigible which discharges its cargo of, say, twenty shells, each weighing fifty or even one hundred pounds, would do little damage in the most crowded of cities. Bomb-dropping at night will be a frequent occurrence in war-time. Once a dirigible has obtained its bearings by day, it can return to the same spot by night, and, hovering over the place, continue its bombardment. In the case of the House of Commons, such tactics would lead to the abandonment of many an intended 'all night sitting,' and so prove a blessing in disguise to some of the jaded members of that historic assembly. On the other hand, the shock experienced by those members who were asleep would probably necessitate many by-elections.

Every war of the future, whether it be waged on land or on sea, will be preluded by a series of fierce air-battles. In view of this fact, witness the great strength of foreign air battalions.

According to *Aeronautics*, Germany will in a few months possess twenty-seven dirigibles of high power, carrying capacity, and speed. Of these at least fifteen are military or naval craft. The dirigible Zeppelin L. 1, recently delivered to the German navy, has a volume of seven hundred and seventy-six thousand cubic feet, a speed of fifty-two miles per hour, and a useful load of fourteen thousand pounds. Its length is

five hundred and twenty-five feet, and diameter forty-nine feet. It is equipped with wireless apparatus, and carries one gun at least. The crew of this vessel consists of two naval officers, one engineer officer, one pilot, and ten men. The Schutte-Lanz S. L. dirigible is fitted with an armoured platform on each side, on which a gun can be mounted. Germany also possesses a fleet of two hundred and fifty aeroplanes, one hundred and twenty of which are of the latest design and make.

By next June France will have twenty-five dirigibles, of which number twenty are for naval or military purposes. Her largest is the *Spéna*, whose volume is four hundred and six thousand cubic feet, length three hundred and forty-one feet, diameter forty-three feet, and speed fifty miles per hour. In 1912 France purchased four hundred aeroplanes of war, and it is authoritatively stated that this number will be greatly exceeded in 1913. The French biplane of war is capable of accommodating three persons, though ordinarily only two will be carried—namely, the aviator and the observer. The latter is armed with a repeating rifle for use against hostile air-craft.

Russia's new dirigible, the *Albatross*, which is driven by two one hundred horse-power motors, carries a wireless installation and one machine-gun. A Henri Farman biplane which lately passed its tests for the Russian army is fitted with a mitrailleuse. This aeroplane is almost the only one in existence in which there is a clear field of fire. It is difficult, however, to see how even moderate accuracy of aim can be obtained with such a weapon, owing to the great vibration the engine causes throughout the whole framework.

All the Powers, great and small, are purchasing air-craft, and we are endeavouring to retrieve our past policy. That policy seems to have been this: Can we, a maritime Power, afford to develop or aid the advancement of a project likely to affect very materially our predominance at sea? Whatever the answer may be, it was obviously our duty to retaliate directly other countries commenced to build air-craft and to study the art of aerial locomotion. Command of the sea is impossible unless we also rule the air. We live in the hope that some great British firm will soon build a huge giant of the air, armoured and heavily armed—the Dreadnought of the Skies.

THE SHIP OF SHADOWS.

CHAPTER XX.—FRIENDS MEET.

I SPENT a week in London before I sailed, and got a ready promise from two kind-hearted and level-headed men to interest themselves in

Lennox. I said nothing more to Hugh on the subject of the wreck.

Two months afterwards, at the Byculla Club,

Bombay, I got a letter from Lennox. He had become private secretary to an M.P., young, noisy, but rich. He got the offer of it through one of my friends, and his letter reflected much gratitude and a measure of content. I wrote him a reply intended for counsel and encouragement, gave him an address for letters, and started up-country on a shooting expedition. I was lucky to get some good heads, but unlucky enough to break a leg, and had to lie up for repairs for some slack and weary months at a remote hill-station. There I got another letter from him, forwarded. His employer, he wrote, contemplated resigning his seat, having discovered (what many people could have told him) that the House was a dull hole. Lennox himself hinted that, for his own part, he was not very sorry, for his secretaryship gave him little or no time for original work. I wrote him again, but got no answer. My accident changed my plans and my itinerary. I was away from England longer than I expected, and as I did not hear from him I reluctantly put 'Proxime' Jim on the drab lengthening roll of the friends one has lost.

It was two years before I heard the roar of the Strand again. Its voice was welcome, for in life's salad I must have a little of London. I only want a little of it, but the little is indispensable. I had been fortunate for once in some speculations, and the siren city gave me the open-armed welcome to the wanderer returned with any money to burn. So I tasted thankfully the joys that await the exile from the East. I realised my dreams of a fresh sole for breakfast. I visited my tailor's and humbly received instructions in the last cry of sartorial inspiration. I met old chums at the club. I listened to the band of the Guards. I did the theatres and halls. I bridged and danced and went to race-meetings. I haunted the Park, marvelling at and admiring the throngs of beautiful women and well-dressed men. I feasted my eyes on the flowers of home and the foliage, choral with the sweet voices of English birds.

Thus a week or two passed in pleasant dalliance, and I had thoughts of running north, when one afternoon Hugh's welcome voice rang me up on the club telephone. He was in London for a day or two. Would I dine early with him at Diennonné's, and go afterwards to a first night of a play? What was more important—for I am not a keen first-nighter—his hospitable voice adumbrated some fishing in the Annan. I accepted his invitation at once—the shrill, sweet music of a salmon-reel rising over the hum of London—and he and I exchanged hearty greetings punctually at the hour appointed. Two other guests, old schoolfellows, were of the party, and the dinner was a cheery affair. We had a great deal to talk about, and there was much laughter and good-fellowship. The time slipped quickly past.

'Mustn't be late, though,' said our host at last. 'We can sup somewhere after the theatre, and yarn away then as much as we like. Meanwhile, we'll get a "move on." I got tickets for this show from the sub-editor of *The Blade-geon*. I don't know what it will be like. It's the first night of a play by Margaret Somers, a new name. Come along!' He bundled us into a taxi-cab.

The theatre, a small one out of the charmed circle of lights, with a reputation for ill-luck in its productions, was full when we arrived. The usual menagerie was there—people in cool evening-dress; smartly dressed women, and men about town; dingy-looking rooks; critics; actors and actresses; pittites and the gallery, packed but good-natured; and the crowd of busy loafers whose opinion concerning the drama does not count, but to whom a first night partakes of the nature of a fetish.

The orchestra finished a handicap, the first violin winning by a short head. There was a hush of expectancy as the curtain rose on a play in three acts—*Jephthah's Daughter*. Of course I do not give its real name. All I shall say is that it dealt with a modern sacrifice, its *motif* based on the pitiful drama of success at too high a price in the life of the great warrior in Israel. 'And she was his only child; beside her he had neither son nor daughter.'

The first act was the usual—or what should be the usual—quiet unfolding of the characters to the audience; no powerful scenes in it, but from the first it held the house. Stalls and pit joined in the applause, and before the second act was half-finished the action of the play had laid a spell on us all. One read the verdict in the strained hush of the audience, in the indescribable thrill of sympathy between the players and the house. Beyond doubt here was no mere craftsman's hand, but the work of a great artist.

At the end of the second act Hugh and I ran across a veteran critic.

'Well?' asked Hugh.

'Splendid!' answered the great man; and then, with the caution of his dread calling, 'so far! But if the finish is as good, it's one of the few triumphs of the imagination on the stage that I've seen. It's a diamond among the tons of rubbish we've been getting lately. Seems too good to be true! I wonder who she is?'

But the third act crowned the play's triumph. It was plain to critics and audience that here for once was the right stuff. In *Jephthah's Daughter* there was no trace of the feeble devices of the jerry-builders. The author owned that rare and elusive thing—the sense of the theatre. The spectacular, the limelight, the carefully concocted epigram, the Parisian diamonds of speech, all were refreshingly absent. The problem-hunter and the collector of toadstools

were ignored. The author had gone to The Book rich beyond all others in the story of human nature. The play owed nothing to scenery, dresses, rickety dialogue, or to forced dramatic situation. Relying on the spoken word, it unfolded a chapter of the heart of man with an insight, a sincerity, and dignity that stirred the depths of us all.

When the curtain fell the play received the rare tribute of a moment or two's tense silence; a long breath, almost a sigh from the enthralled house, and then a hurricane of whole-hearted applause.

Hugh turned to me, and gulped out huskily, 'By George, old man, that's great, y'know! Makes one feel—er—you know—eh!' He cleared his throat with unnecessary vigour. For a Philistine, his voice was strangely unsteady. 'You know what I mean? What!'

I did; and, although I remembered some of his caustic criticisms on art and romance, I refrained from the poetic justice of grunting out 'Imphm!'

Up and down went the curtain on the 'picture' of the last scene, the cast, the leading actor and actress; and then—surely one of the sweetest and most refreshing of earthly guerdons—came the shouts of 'Author! Author!' There was no response, and I thought that perhaps the manager would appear to give us the conventional inexactitude about the author not being in the house. But the calls were lustily renewed, and at last the curtain rose again. Alone on the stage was a slight figure that bowed and bowed its thanks to us. 'Margaret Somers' was a man. He looked up with a shy, boyish smile at the charmed house. I knew him at once. I clutched Hugh's arm, and handed him my opera-glasses.

'Look, Hugh! Ever seen him before?'

Hugh looked, and looked again. 'By all that's wonderful! I believe—— It—it can't be! It's "Proxime" Jim!'

It was. I scribbled a note and sent it round post-haste to him. He came at once, his eye glowing as we met. Sure am I that both of us at that moment harked back to our meeting in Galloway, and that among all the congratulations he received none were dearer than mine. He insisted on carrying us off with him to a delightful little gathering of the genus airily classified under the label 'literary and artistic.' Authors, playwrights, actors, journalists, first-nighters were there with their friends. A

Cabinet Minister and one of his chief opponents had paired, and exchanged grins at the door.

At first I could scarcely get a word with Lennox, for there were renewed congratulations from everybody, and much good talk. He was the centre of a little maelstrom of attention, so that it was no easy matter to get a few minutes with him; but at last the ranks thinned, and we drifted to a corner. He had never received the letter that I wrote him in answer to his from up-country in India. In all probability—if I know the breed—a native had stolen the stamps and burned the letter. It happened that, through his employer, he had made the acquaintance of two or three of the 'mandarins' of theatrical management. The futilities swallowed by the British playgoer had filled him with amazement, and gradually the idea of writing a play grew into an obsession. After his employer had resigned his seat, and Lennox's secretaryship had become a make-believe, he deliberately refused to continue in it, and set himself to master the difficult business of stage technique; and to that end, refusing some offers to go back to routine work, he had, through his theatrical friends, 'gone on,' first as a super, and then in a small part or two.

'It wasn't easy. The rest you know,' he said, just as a great dramatist got up, and in a speech that mirrored the thoughts of us all gave the toast of the author of *Jephthah's Daughter*. Lennox, unspoiled—as he still is—his voice barely under control, replied in a couple of sentences. They were lame and halting, but far beyond rhetoric. His eye met mine as he sat down, and I know that his thoughts and my own were at that moment towards a summer night of two years before, in the hush of the country, the stars swinging high over the Galloway hills.

'Lucky man! I hear that he can book commissions for years already,' a young painter whispered at my elbow. 'Some fellows have all the luck.'

His look was wistful, or I might have cavilled at his phrase. I said nothing.

If the word 'luck' jarred, it was for an instant only, to be drowned in the music of my thoughts, for I knew that luck does not haunt the road that my friend had trudged with naked feet—the long flinty road leading, sometimes, to the jealous gates of Art.

THE END.

THE FISHERMAN ABROAD.

By R. W. BURGESS.

FROM 'the back of beyond,' among the Negri Sembilan Hills, flows the Muar River, winding around the foothills of Mount Ophir in Malacca, clear and bright while yet its bed is of mountain sand and shingle, but changing to a turbid flood as it continues its journey through the tiger-haunted jungles of Johore, where swampy valleys pay their tribute of silt-laden water to its ever-widening flood. It is the highway of the Malay villagers, whose plantations of coco-palm and betel-nut fringe the shores on the higher banks, increasing stretches of mangrove swamp, or graceful feathery atap palms, growing with their feet in the water at high-tide, lining the lower reaches as it nears the sea.

Two momentous years of my life were passed on the banks of this river, some forty miles up from the sea. To reach this salubrious spot one has to embark at Singapore on a small Chinese-owned coasting-steamer plying between that port and Malacca, and calling at the native town of Bandar Maharani at the mouth of the river. Here one disembarks, usually in the small hours of the morning, long before daylight, on to a feeble and dilapidated bamboo landing-stage, with no shelter, and with nothing to do but sit on one's baggage and wait for dawn. At the first glimmer of daylight the little town awakens suddenly into full and bustling life. Chinese pedlars appear from mysterious haunts, having baskets of comestibles or little glazed cabinets displaying a quaint variety of small merchandise slung on bamboo poles across their shoulders, and with raucous shouts, aided by tin rattles, call attention to their wares. The native shops are opened, ancient and dangerous-looking rickshaws rattle up and down the roads, and a yelling crowd of coolies begin to load up the fussy little Chinese up-river launch now getting up steam. On this craft one's journey is continued, among an unsavoury crowd of coolies and still more unsavoury merchandise destined for the most part for Chinese 'universal providers' in the small native riverside villages.

Turbid and slate-coloured, with logs and floating islands of vegetation borne along on the slow current, crocodile infested, and bordered by steaming swamp, this sombre flood is a contrast indeed to the tumbling, dancing streams of the north of England, with their endless charm of rocky pool and gravelly shallow, or the placid Hampshire chalk-streams of happy memory.

I have not spent many days beside the river, however, before I feel the fishing fever stirring within me. An incurable malady is this, recurring whenever water is in sight. I had acquired it in an aggravated form in the far-off days of my youth among the Sussex brooklands.

Having seen fish of unknown variety rising near the shore during the still hour of fading light after the daily sea-breeze had died away, one afternoon when work is over I determine to try my luck.

For the lordly mahseer or such-like monsters I am unequipped, work rather than play being my object in coming to this far-off land, and my slender means when I left home not allowing of a sporting outfit; but my cherished greenheart rod I have by me, companion of my happiest hours, fraught throughout its slender length with quivering memories of vivid moments in many a hard-fought battle with the gallant trout.

On looking up my tackle, I find that a tin case, in which should have been my small dry flies, proves to be empty. My Chinese 'boy,' who has charge of my belongings, informs me, on inquiry, that, having found nothing but some dead insects within it, he had brushed them out. After explaining to him, with vigorous emphasis, the nature of the 'dead insects,' I find in the folds of my tackle-case some few remaining, also a selection of larger varieties of sea-trout flies.

I do not much fancy casting from a native dug-out canoe; with only about two inches of freeboard, there would be a good sporting chance of an involuntary swim, with crocodiles as companions of the bath. As this is the only craft available, I decide to make my first essay from the bank.

There is a small, decrepit pier, just wide enough to walk on, extending beyond the tidal mud. It is made of bamboo stakes and a few waste planks, and was erected for the use of the *tukang ayer*, the water-carrier, when dipping water from the river for domestic use. It was constructed with no margin of safety, the end having already fallen into decay, and the whole structure having an infirm and aged appearance. As the only alternative to wading in a foot or so of slimy mud, I decide to use this frail staging.

The size, habits, and food of possible fish are all unknown quantities; indeed, it is far from certain that any fish in the river will take a fly at all. However, a few fish are occasionally rising at something invisible, so I try them first with the dry fly.

Now any reader who is expecting details of thrilling struggles with gigantic fish had better stop here. I am a FISHERMAN, and as such incapable of departing in the slightest detail from the bounds of the strictest veracity. It is only those poor mortals, alien and outcast, to whom the rod is but a sequence of jointed, tapering sticks, brass rings, and varnish, and to whom fish are merely food—faugh! food indeed! Does the foxhunter eat his fox or the fisherman his

chub?—that presume to doubt the truth of anglers' stories. Why, is not the very word 'fishy' the synonym for all that is good and true? Is not— But enough. Please excuse this digression. My feelings for the moment overcame me.

After I had been casting at random for a few minutes, something takes my fly. What it is, large or small, I cannot say, as the gut promptly breaks on striking, and I have scored my first miss.

Gut perishes rapidly in the moist heat of this country; and on testing, I find all my *fine* casts in a bad way.

Selecting a stouter length, with a small 'silver doctor' for the fly, I change my tactics, letting the fly sink a few feet under water at each cast. For some half-hour I whip the river industriously, with no result. At last there is a pluck at the line, and, striking sharply, I caught my first fish in tropical waters!

Is there any sensation in this life that can compare with the electric thrill that runs through every nerve and fibre of the body at the sudden tightening of the line, the quiver and spring of the rod, that tell of a fish well hooked? If there is, I have never experienced it.

In this instance there is the additional interest of the unknown. What manner of fish will come to the bank? Will it be handsome or hideous, safe to handle or poisonous? Will it, indeed, be a fish at all, or will it be some other water monstrosity? Anything is possible.

I need not have excited myself, however, as there is nothing very strange about this specimen. It is somewhat similar to an English perch, and about a pound in weight. It has a spiny back-fin, erected on leaving the water, a large head, and huge red eyes set rather close together, these being the only abnormal features.

By this time many of the Chinese and Malay labourers employed on the plantation have gathered on the bank to watch the strange proceedings. The Chinese have a tolerant but slightly contemptuous smile for the foolishness of the *Tuan* who is taking all this trouble to catch a few small fish that he does not require for food; accounting for it, I suppose, by recalling the well-known (Chinese) fact that all the red-haired foreign devils are mad.

The Malays, on the other hand, being good sportsmen, are much interested. One old fellow politely asks to see my bait. He looks askance at my confection of tinsel and feather, wags his head solemnly, and says it is very pretty, but he does not think the fish will eat it. He goes thoughtfully away, but presently returns, smiling benevolently, and produces a flat package, which on being unfolded is found to contain some remarkably fine specimens of the domestic cockroach in a squashed and juicy condition, besides other nameless horrors, which he gravely presents to me, assuring me that with these I shall catch many fish. I thank him profusely, promising to

use them later, and telling him I am now trying to see if Johore fish will take the bait I use in my own country. He seems sceptical on this point, but wishes me luck and departs.

The next capture is rather a startling event. Fishing in the same manner, deep in the water, I have a sharp tug, and bring to land a fish about the same size as the last, a brilliant green in colour, with a large head, and having an evil gleam in its eye. As I carefully examine it to see if it is safe to handle, it starts making a curious sucking noise, and, to my amazement, begins to grow visibly larger! I decide to await developments before touching the thing. The curious performance continues until it has assumed the shape of a Rugby football, with short, erect spines covering the body. Wrapping a thick cloth around it, I handle it gingerly, disengaging the hook, and drop the uncanny creature back into the water, where it subsides like a pricked bladder and swims away.

A blank interval follows, so I change the fly for a 'green and teal.' With this two pretty silvery fish, about six ounces in weight, are taken, very similar to dace, but with larger scales.

The next interesting event is the collapse of the fragile structure on which I am standing. I have incautiously advanced too near to the rotten end, and some six feet of the staging slides away into dismal ruin, leaving me up to the waist in mud and water, clinging to the wreckage. I manage to scramble to the top again, with no more serious damage than wet and muddy clothes, which one takes little notice of in this climate.

After a short interval for cleansing and refreshment, my rod and tackle being undamaged, I resume operations. The tide is rising, so the shortening of the pier is little hindrance.

My next capture is another weird-looking creature. The Malay name, *ikan parang*, or knife-fish, aptly describes the shape. It is rather like a long, thin herring that has been put through a mangle, the under part of the body tapering off to a knife-edge, and resembling nothing so much as the blade of a thick-backed, long-bladed *parang* that the Malays use for cutting undergrowth in the jungle. The striking feature of this fish is the curious upturned mouth and the position of the eyes, which are set close together at the top of the head, giving it a strangely deformed appearance. The Malays say it is good eating, but I have not tried it. It is a sporting fish, and puts up a strong fight.

The sun is now setting, and in half-an-hour it will be dark. Just as I am thinking of packing up, I see, about a hundred yards up-river, what appear in the dusk to be several huge fish cruising around near the shore, their large, triangular back-fins showing at times above the water.

The tide has covered the mud, so I can get near enough to them to cast from the bank. Taking up a strategical position, screened by a

dump of high grass, I cast carefully at each of these objects as they come within range, with high hopes of an exciting struggle with a leviathan to wind up the evening's sport. Vain hope! They take no notice whatever of my fly, and one by one sail quietly out into deep water and disappear.

The phenomenon, by the way, was repeated next day in bright sunlight, and I then discovered that the objects I had taken in the dusk for the fins of fish were the small, rat-like heads of river turtle projected above the water. I know not what these creatures feed on, but had one by any chance taken my fly it would have been novel sport indeed!

The short twilight of the tropics is now rapidly fading into the darkness of night. The steady breeze that has tempered the heat during the day has quite died away, leaving the air still and heavy, and the nocturnal concert of the tropics is commencing. The cicadas are tuning up. First a single insect begins his shrill, elusive chirp, then others join in the chorus, until the sound merges into a continuous sizzling murmur, which will continue throughout the hours of darkness. The bass parts of the symphony are supplied by the croaking of count-

less frogs in the swampy pools by the margin of the river. The *wah wah* monkeys in the jungle across the river are settling down for the night, calling one to another with a curious whistling cry which rises and falls in pitch like the siren of a steamer. The bark of a deer from the jungle cuts sharply through the still air, while a night-jar near by with his intermittent note recalls the sound of a stone bouncing over a frozen pond.

As the darkness deepens the illuminated dance of the fireflies begins, myriads of them around favoured trees and bushes apparently opening and closing their lanterns by concerted action, a few stray ones aimlessly drifting and twinkling about in the open, while distant lightning is flickering round the horizon.

The mosquitoes are on the feed, and after dark tigers and panthers and other jungle pests may be on the prowl; so I pack up, and make tracks for the bungalow, where a welcome tub and change of garments await me. Then dinner, during which the adventures of the day are recounted, and tales told of the mighty fish I *nearly* caught; a rubber of bridge with my three companions of the wilderness; then to bed, under the curtains, where mosquitoes cease from troubling and the fisherman may rest.

ATLANTIC GOLD.

CHAPTER III.

DURING the night rain fell, and the hills of Skye were still banded with white vapours when Arcus resumed his voyage. Through the mild, moist air, through the gray, unruffled Sound, the *Vesta* sped, her engine running as sweetly as ever. Past Staffin Bay, with its far-stretching green and scattered gray cottages, past a succession of sheer cliffs, basaltic and streaked with snowy waterfalls, past the little port of Kilmaluig, she sped; then by that high islet, whose odd shape you will see precisely reproduced and reproduced in Hebridean, Orca-dian, and Icelandic waters; round the Aird, and so into the Little Minch.

Arcus unrolled the chart on his knee. Twenty-five miles, almost due west, lay Rodel, at the entrance to the Sound of Harris; at a slightly less distance, in a more northerly direction, East Loch Tarbert opened. By taking the latter course he would find himself at the whaling-station in a few hours; by holding to his original plan he might, perhaps, reach his destination by nightfall. For a minute or two he hesitated—he could not have told why. His mind was certainly not then swayed by any memory of his hotel acquaintance of the previous night, nor by any thought of a telegram from Anstruther waiting him at the station. He had not specified an hour, nor even a day, for his arrival there; his host and he

were sufficiently men of the world—the world, that is, in the larger sense of the word—to dispense with formalities. The still weather favoured the longer journey; the voyager was by no means tired of his own company. There was nothing, indeed, to discourage the original plans. Yet Arcus hesitated, his eyes on two names on the chart, his intention wavering like the needle of his little compass between two points, while in one of these directions, away in the mist, unknown to him, waited the great adventure of his adventurous life.

With a laugh at his indecision, he finally set the *Vesta's* bow for Rodel. 'Forgot my breakfast—that's what's the matter,' he said to a gull. From a locker he brought a thermos of tea, some sandwiches, and a couple of hard-boiled eggs, and proceeded to make a hearty repast. Ere he had finished a light breeze came crisp from the north, and presently the sun won forth. And soon the mists took flight, the sea sparkled, the Hebridean hills appeared. A couple of herring-smacks passed half a mile to leeward; their weary crews were shipping the long, heavy sweeps, and thanking God, mayhap, for the blessed breeze that bulged at last the brown, dank sails. No other craft were in sight; only on the southern horizon a trail of smoke. High in the air a gannet shut his wings and fell like a bolt on his quarry beneath

the ripples. A cormorant, black but uncomely, flapped ponderously shoreward, a dreary glutton beside the handsome gallant emerging with his feast. Here and there parties of quaint little sea-birds paddled and dived. And, behold! a school of porpoises puffing and plunging with glistering hides through gleaming spray.

Arcus laughed aloud. For this he had fled from London!

The sun was high when, having passed Rodel and rounded Ru Rhenish, the *Vesta* entered the Sound. In clear weather the waterway between Harris and North Uist, despite its numerous islets and shoals, need not trouble the moderately careful navigator, especially if his craft possesses motive-power and as shallow a draught as the *Vesta*. Nevertheless Arcus exercised an unwonted caution, following to the best of his ability the track dotted on his chart, and running the motor at half-speed. Suspecting strong currents, moreover, he anchored before partaking of a frugal dinner. After all, he had his pride, and was less anxious about reaching his destination than about the message on the post-card to be thence despatched to his hotel acquaintance. He wanted to be able to write: 'Arrived without slightest mishap.' Later, he spent over an hour in getting his anchor up from foul ground, whereby the passage through the Sound took longer than he had calculated, and the afternoon was waning when, close to the lone, lofty rock called Coppey, the *Vesta* began to cut the waters of the veritable Atlantic.

Arcus was boyishly pleased to be there; but his gratification was presently tempered by the realisation that he could not reach the whaling-station, some twenty miles away, in daylight. He was not foolhardy enough to relish entering a strange loch in darkness. It would be only sensible to retreat a few miles and find harbourage for the night. But stay! there ought to be a full moon shortly. Yes, rising at seven-seventeen. That was more like his luck. He would go on! He gave the *Vesta* her full speed, and set his course north-east. And immediately a spirt of spray flicked his face. The wind had shifted to the east; ere long he became aware that it was keen. Soon, too, he became aware of changes in the sky. Low in the west the sun smouldered behind banking-up clouds; overhead hues lately lovely grew angry, sulky, dull, dead. Bleak, vaporous masses gathered and swelled and lowered. There was a covert threat in the very atmosphere. And as Arcus doubted, yet held on his course, a squall swooped down from the grim, gray mountains of Harris and through the Sound of Taransay. A silence that became a sigh, a sigh that rose to a savage hiss, and it was upon him. The spray stung.

Arcus put the helm to starboard. No good in attempting to make West Loch Tarbert now. He wriggled into his oilskins and faced the wind and the vicious little new-born breakers.

The nearest land was not three miles away. But all the land, even as he gazed, was blotted out.

Came the rain, fine as needles, chill and dense. Arcus screwed up his face and laughed softly. For this also he had fled from London! A gust of salt-water rattled on his oilskins, and he shouted defiance. And at his shout, with a snap, a grating, a clatter, the motor struck work. There was silence save for the eager sibilance of broken water.

Arcus opened the covering of the motor. He was no engineer, though he had handled refractory engines in his time. The *Vesta's* motor was not of a pattern familiar to him, but he knew enough and saw enough to judge that repair of the damage was beyond him. A cylinder had split; a rod had run amuck. He softly cursed the engine and its Muranium steel, the invention and the discovery of the late Sir Francis M'Calmont.

During the hopeless inspection the last wretched blur of the sun disappeared. At the end of it Arcus wiped his hands on a lump of waste, and made a hasty meal, for he felt cold, if not precisely hungry. The last of his tea (now cool), a handful of biscuits, and a couple of pears satisfied him. The *Vesta* carried a week's stores, plenty of water, also a spirit-kettle. It was not starvation that stared him in the face; lack of food was a distant prospect compared with that of his being beyond the need of it. He was not so much concerned about the buoyancy of the craft joggling under him as about its stability. He had watched Atlantic seas and surges from the decks of liners. He judged that the disabled *Vesta* must be travelling oceanward at a fair rate, and he knew there was nothing solid between him and the American continent excepting little St Kilda and its lesser neighbours, Boreray and Soay. He had heard of the sea-anchor used by fishers in a gale, but had no idea of the rigging of that expedient.

As he ate he summed up his chances, remembering items of information casually gleaned from his friend the manager of the whaling-station. His chances, all of them but one, lay within a semicircle of a hundred miles' radius, and they appeared to his mind's eye as ships—trawlers, steam-drifters, sailers, whale-boats, perhaps a Scandinavian-American liner. But here is a patch of ocean so deserted at best that you may cruise it for a week in clear weather without sighting sail or trail of smoke. His remaining and barest chance—the tiny dingy lurching on the starboard quarter was not to be reckoned—hung upon the wind; and the wind's changing soon to the opposite point of the compass was a possibility almost too remote even for so sanguine a spirit as Arcus's.

He studied the compass again, and peered at the damp chart. It seemed to him that the wind had already veered to the south-east. But if it

steadied in that quarter he was in worse case than ever, for he would be blown far north of St Kilda, and it was round St Kilda (so he had heard) that the trawlers and whalers were most given to ply their business.

Despair, however, was not to find an easy prey in Arcus, who had faced what most of us deem the supreme disaster before now. Yet until now he had never done so alone; and danger in solitude is the ultimate test of a man. Arcus was not afraid of death, but he hated it as strongly as he cherished life. And he loved this world. He had seen more than most men, and perhaps—in spite of his freedom from sordid responsibilities and his lack of ambition—he had achieved more also; for even in these jingling days a man may 'do things' without earning or desiring to earn a penny. Some of us would seem to believe that the Recording Angel's Book is ruled with cash columns.

In the dwindling twilight he rose and went forward. The *Vesta* was half-decked; the little, dim cabin was an inviting shelter. Arcus secured such articles of food and raiment as he was likely to require during the night, closed the watertight door, and made things generally as snug as possible. The *Vesta* had been constructed with an eye to safety; with her hull intact she was unsinkable though her navigator should sit to the breast in brine. Arcus picked his way back to the stern with his bundle and also the lamp, which, after some trouble, he managed to light. He contrived to secure the lamp within easy reach, ready for signalling with at a moment's notice; placed the food in the locker; donned a muffler, sou'-wester, and high boots; and settled himself to await what the night might bring forth.

The seas continued to increase; the rain thickened and drove across the *Vesta* in roaring blatters, with brief, sullen drenchings between. Of the moon there came no sign, though her presence behind the clouds saved the night from utter darkness.

The eyes of the voyager searched diligently for a light. 'Looks as if the post-card will include a humble apology,' he said to himself at the end of an hour, during which his thoughts had been with the few people he loved and the many he liked, his hotel acquaintance, curiously enough, having cropped up among the latter. In the next world it will be rather interesting to compare the numbers of familiar faces that pass us stolidly with those of the strange ones that lighten with casual kindnesses may be remembered when our handsomest hospitalities are forgotten.

Arcus made sundry ineffectual attempts to light a cigarette. For a man on the brink of destruction his annoyance over so paltry a disappointment was doubtless quite inexcusable. Other and less carnal matters than tobacco ought to have occupied his attention. Still, humanity

does not grudge the murderer a boiled egg with his last breakfast, and would probably not despise him the more if he ate it. Arcus had his share of sins to think on had he been so inclined; but as he dropped the pulp of tobacco and paper, and began to munch a biscuit, salted ere it reached his teeth, his thoughts reverted to his friends. They dwelt longest on Anstruther. Though not his oldest, Anstruther was his closest friend. They had come together in the most commonplace fashion—through business—and by degrees the formal acquaintanceship had given place to mutual regard, which in turn developed into honest, unselfish affection. Dear as he held his own life, Arcus had yet the heart to consider now the temporal affairs of his friend. He knew that Anstruther was not a wealthy man, and of a sudden words of the latter's telegram came back to him: 'Matters serious. Much worried.' By any chance had Anstruther referred to his own business? Arcus cursed himself for not having replied differently. He ought to have wired Anstruther to make use, if necessary, of the securities sent him from the bank. He had proved a poor sort of friend. Well, he must wire Anstruther the moment he reached land—a bitter gust of brine slapped into his face as he peered in the direction where he supposed land to be—if ever he did reach it. Fool that he was, he had never made a will! His money would go to cousins who did not need it. But it was early yet to think of that.

Of women his thoughts were few, kindly, a trifle humorous. His smile was without cynicism. There had been sentimental passages in his youth—passages leading to nowhere, as Anstruther had once called them. Arcus had looked Life and Death straight in the face; but the third of the three great powers, Love, he had passed with a glance. Nevertheless, there had been a girl in Sydney whom he might have—

A violent lurch of the boat threw him off his balance. Recovering himself, he held his watch to the lamp. Ten minutes past nine—more than two hours since the *Vesta* had become a sport to the elements. He wondered how far he had been carried. Then an idea occurred to him. The principle of the sea-anchor was unknown to him; but might not the *Vesta's* progress be checked by swamping the dingy and so making the small boat a drag on the large? Gripping the painter with numbed hands, he drew in the dingy. She was already half-full; a mixture of rain and sea washed about her thwarts. He transferred her oars to the *Vesta*. There was more difficulty in tilting the dingy than he had anticipated; but at the cost of a bruised hand he at last achieved the task, and let her go, all but submerged. He was congratulating himself on the success of his expedient—undoubtedly it worked, though how far effectively he could not tell—when the painter parted. The dingy was gone ere he got out the boat-hook.

Somehow the mishap disheartened him. Presently, however, he set to work to rig a sort of mast and sail out of boat-hook, oar, and clothes from his bunk. The effort restored his circulation somewhat, and quickened hope. During a lull he returned to his seat in the stern and took the helm. But the pressure of the reviving gale was too much, and his crazy erection collapsed overboard.

For a space he sat as if stunned. Then he caught up the lamp, and, rising, waved it at his arm's height. There was something of franticness in the action—which, however, was brief. 'You're making a fool of yourself!' he said aloud. 'Sit down and have patience.' Whereupon he methodically replaced the lamp in security, and, huddling in the bottom of the boat, sodden and sore, set himself to wait and watch to keep despair at bay.

The hours dragged past. About midnight the rain became torrential. He was soon sitting in water, but the position was easier for his exhausted body than the narrow seat above. Those three long days of navigation and nights of insufficient sleep were having their effect. In the face of death he was actually drowsy. His eyes ached with peering into the darkness; their lids sagged in spite of his determination to watch. He ate some biscuits and chocolate, and partook of his flask for the first time. For a little while the spirit supplied alertness. He fancied the wind was falling. The motion of the boat was more of a swing than a joggle. But the sea was bigger. He wondered once more how many miles he had been blown from the Hebrides. He took another sip of whisky.

He held out till two in the morning, and then his self-command relaxed, and he drowsed.

He awoke in a flood of light. Thin tatters of cloud were racing across the full face of the moon, now almost directly overhead. The rain had ceased. But the sea had further risen, and there were crashes amid the hissing of the breakers. Rubbing slumber and salt from his eyes, Arcus stared about him. And he cried aloud.

The *Vesta* was close to land, so close that Arcus drew himself to his knees and, as the boat was tossed high, wrenched at the tiller.

Out of the radiant sea, fringed with foam, embraced by the bursting swell, and be showered

with soaring spray, rose ragged masses of rock like ebony touched with silver, and from the noisy surge sprang streaming reefs and pinnacles, fangs watching for their prey.

When the *Vesta* dipped into the next trough there was a jar and a shudder under the man's knees. He seized the dingy's remaining oar and staggered forward. There might be a clear passage somewhere. A high-crested billow, hissing, caught the *Vesta*, heaved her over, half-swamping her, then up and swooped with her shoreward, then lost its grip, as it seemed, and let her slip back over its shoulder. Arcus had a bare glimpse of something black amid the turmoil, and within the instant the *Vesta* crashed down on a knife-like ridge, breaking her back. The water swirled about Arcus's knees, his waist, his chest. Somehow he managed to get rid of his high boots. He was an indifferent swimmer. He was tearing at the buttons of his oilskins, when another huge roller arrived. It caught up its victim, rending the wound, and tossed her to the next row of grinning black fangs. Arcus, clutching the oar, was pitched overboard. He struck rock, grabbed at weeds that failed him, struck again—this time with his head—was sucked backwards and downwards, half-stunned and suffocating, yet clinging to the oar. And then a wave took him and slung him at the shore.

He came to himself, his hands clawing at pebbles, his feet kicking feebly at the receding foam. The clouds were thickening again, and the moon was hidden. At the third attempt he arose, omitting to thank Providence that he was only bruised instead of broken. The omission may have been due to mere carelessness, or to the fact that the moment he was upright he perceived a light. It seemed to burn at the end of a tunnel through the wall of rock above him. Stumbling painfully up the steep beach, blown through the tunnel by the gale, and along a stony path, he came at last to the source of the light—a window. Wiping his bleared eyes, he peeped between partially drawn curtains.

Within, under the glow of an electric lamp, a woman sat writing. Arcus, feeling faint, raised his hand to tap, hesitated, and sought for the door of the house. It was not far away; still, he had difficulty in dragging his limbs thither. With nerveless fists he beat upon it and collapsed.

(Continued in following section of this part.)

THE LAST NATIVE KINGDOM OF THE PACIFIC.

By J. O. BYRNE.

TONGANS are proud to be spoken of as the Anglo-Saxons of the South Pacific. Eighty years ago they were heathens, barbarians, and savages; to-day they are among the most polite

people of the world, the kindest in disposition, and the most anxious to stand high in the estimation of civilised peoples. They have not become flaccid or supine. In a just cause the

courage and daring of the old time blaze out, and the community talks rebellion or war; but the rulers recognise that such war as they could wage is out of date in present circumstances. It is not Fijians or Samoans or other indigenous tribes they now regard as crossing their path, but the great Powers of Europe, with an occasional threat from the Republic of the Stars and Stripes. A few years ago Germany was said to have made up its mind to annex Tonga, proposing to give Britain territory in the Solomon Islands in exchange. There are people who believe such an exchange still possible. In Australia, however, any such exchange would be regarded as a calamity. The surrender of Samoa for some territory in the Solomon group was bad enough; but Tonga has been so long and intimately associated with Australia that the bartering of it away for territory elsewhere would be hard to justify. The Tonga Islands have been Anglicised on an Australian model. The trade they carry on with Sydney and New Zealand is considerable and growing. Tasman discovered the islands, but Captain Cook, on his second and third voyages, took possession of them under the name of the Friendly Islands; and, following fast on the settlement of Australia, they came under the influence of British civilisation. All the natives profess Christianity. The Government is a limited monarchy under British protection. The king, the only recognised native king in the Pacific, is assisted by an Executive and a Legislative Assembly of thirty-one hereditary chiefs and thirty-one representatives of the people, elected every three years. The population is estimated at between twenty and twenty-five thousand, of whom nearly three hundred are Europeans. There are over one hundred islands in the group, but only about thirty maintain an appreciable population.

King George Tubou the Second, the present ruler, succeeded to the throne of Tonga at nineteen years of age. He joined in his own person two royal lines, his father being the son of the late king's daughter, and his mother the daughter of the late king's son.

Old King George was unlike his grandson in many respects. He was aggressive as a youth, and continued so all through his long life. In the closing years senile decay clouded his faculties; but till he died at the age of ninety-four he often broke through the disabilities of years and assumed the manner his people admired. He originally won the throne of Tonga by his genius for arms and a barbaric sort of state intrigue, managing thereby to deport the rightful heir to a chieftainship over a section of his race in Fiji. But, though personally unscrupulous, he perceived what made for the progress of his people, and worked hard to realise ideals. The Tongan kings ruled both temporally and spiritually, and when King George embraced Christianity his people also embraced it. A previous king had

seized a band of Christian missionaries who landed on the isles, and killed all of them; but King George frankly admitted, after careful comparisons, that the white man's faith was superior to that of his race, and promptly announced that he would devote himself to its propagation. He became a preacher at forty years of age. In 1876 he entered into a treaty with Germany, in 1879 with Britain, and in 1888 with the United States. By these treaties the independence of Tonga was assured, and the arrangement lasted till the British protectorate was established.

When the present king ascended the throne there were many doubts as to his capacity to maintain Tonga as an independent kingdom. His predecessors had a moroseness and savagery of disposition which at critical periods were regarded by their subjects as evidences of power; George Tubou the Second is amiable above everything. Although his grandfather gave a constitution to his people, he did not let the personal element disappear. They recognised that he was still king, and that he counted for a great deal. On some occasions it was he who limited the constitution instead of the constitution limiting him. The grandson began his reign by a docility that was taken for timidity. Local rivals consequently beset him, and demanded concessions. Traders poured in claims, many of them impossible to entertain, and on being staved off threatened to hoist foreign flags on the islands. A fear of foreign gunboats haunted the people. The king may have relied on the merits of his case, but his manner under menace was not the manner that made his ancestors famous. His subjects desired the old royal cry of defiance. They were a warrior people in all their traditions, and ready to meet threats half-way. Finoo, King of Haapai, the present king's birthplace, once exclaimed, 'Oh that the gods would make me King of England! There is not an island in the whole world that I would not then subject to my power. I would come down with the front of battle and the thunder of cannon. None but men of enterprising spirit should be in possession of guns. Let such rule the earth, and those be their vassals who can bear to submit to insulting threats!' Threat is the true Tongan sentiment. It is that sentiment which made the people the most active, daring, and ambitious of Pacific races. The change to King George Tubou the Second suggested to them, therefore, an inexplicable contrast; and his attitude in applying to a court of law to get back his expatriated Premier, and petitioning the late King Edward and Mr Lyttelton, the Secretary of State for the Colonies, to exercise their good offices on his behalf, complete a picture of humble suing the old barbaric spirit failed to appreciate.

The political outlook of Tonga is full of interest to Australians. Vavau is one of the finest islands in the Pacific, and much in the same latitude as Sydney. The group has large strategic possibili-

ties, and possesses at least one magnificent harbour—Vavau. The tripartite control served its day, and the days of the protectorate are near a close; the time for annexation seems almost at hand. Australia has an interest besides the political one in the fortunes of the little kingdom. Social intercourse between the two has often been close. A couple of the royal princes went to school near Sydney. One of the last trips taken to the islands by Sir George Debbs when Premier of New South Wales included an exchange of views with King George the Second. Lady Jersey leaves on record an account of her visit to the king's grandfather while Lord Jersey was Governor of New South Wales. The old king, to her surprise, came to meet her dressed in a full London-made tailor suit. Lady Jersey was literary and in search of 'copy,' and this zeal for current fashion did not nearly so much gratify her as if he had received her more in native fashion. But the old king was punctilious in matters social when representative Britons called upon him. He was—and his grandson resembles him in that—profuse in inquiries about Sydney and all that concerns it. And the royal house has shown a systematic desire to trade with Sydney. The old king had a yacht built there at a cost of over three thousand pounds. She was a sort of brigantine, and, although not exactly what

he wanted, gave him no end of enjoyment. The present king ordered the five cannon which celebrated his marriage from the Atlas Engineering Works, Woolwich, near Sydney. Of course, the pieces of ordnance did not cease duty on completing this service; to-day they salute the warships of all friendly nations.

Although about two thousand miles apart, Sydney and Tonga touch at so many points of trade and sentiment that the future of the group of islands excites as deep interest as if they lay in Australian waters. A year ago it was semi-officially stated that the British Government was negotiating to pass the islands over to New Zealand. At that time the Tongan people, if they were to lose their independence, favoured association with Australia, and still do so. Australia, however, has tropical regions, and the products of coloured labour might be met with a hostile tariff. It is probable a friendly arrangement could be reached; but while the matter was in suspense Tonga settled down to a union with Fiji under the High Commissioner of the Pacific. This is not wholly agreeable to the Tongan people; but, looking at all their surroundings, they are temporarily content, and for a little longer the only native kingdom of the Pacific maintains a measure of independence under the protection of Great Britain.

THE DIAMOND SMUGGLER.

CHAPTER II.

THURSDAY afternoon found the *Micah* safely docked, and Lawrie extremely anxious to get ashore with his own handbag and nothing else.

But it was not to be. His generosity to the cabin-steward was perhaps a mistake. Before he could get clear of the ship the man came up to him with that miserable portmanteau of Kramm's, the handles over the broken lock knotted with string just as they were after his raid upon it.

'I suppose you were coming back, sir; but you'd better let the Custom officers examine it at once. Then you can deposit it, if you like,' he explained.

Lawrie swallowed the pill. It was most disagreeable to open out Kramm's goods to his fellow-travellers and the Argus-eyed officials; but he went through with it. His particular inspector seemed struck at once by the meagre exhibition, and glanced at him incredulously. Then he discovered and unwrapped the cheeses, and said, 'Hello!'

'You may keep them,' said Lawrie in a low voice, 'whether they're contraband or not. I'll be glad to be rid of them.'

The man's second glance gave him a quite correct estimate of Lawrie's humiliation in this

public exposure of his properties. He snorted dryly, tumbled the cheeses back into the portmanteau, and said something unnecessary about hot weather and farmhouse truck. The remainder of Lawrie's examination was brief and unfruitful for the great nation's revenue, and at the end of it he went forth restively into the city.

For a hot hour he meandered about the streets of New York, seeking a suitably modest hotel for luggage like Kramm's. A boy carried the portmanteau, and it was praise for his honesty that he opposed two determined attempts on Lawrie's part to lose him.

Thus they came to the Brooklyn Bridge; and, remembering the communication about the two cheeses, Lawrie remembered also the envelope still in his pocket. 'Just a moment,' he said, and referred to it.

For a daring other moment or two he actually thought of delivering the portmanteau at its proper destination in Lexington Street, and indeed nothing could have been simpler than to instruct the boy to that effect. But instead of this he decided only to look at the street, and thither they went across the bridge. And the upshot was that after a passing survey of the unpretentious two-storied No. 24 of the address,

he rang at No. 29 in the street, and obtained a bedroom there. The placard, 'Hinkson's Private Hotel,' above its door was not to be resisted after so melting a ramble.

'Certainly! Come right in!' said the untidy woman whom he asked if he could be accommodated. 'I'm Mrs Hinkson myself.'

Lawrie's 'That's a blessing!' was for himself alone. 'You're a gentleman!' said the boy in return for a dollar; and Lawrie followed Mrs Hinkson into a back-parlour with a sudden bitter mock of the boy's ignorance in such a matter when he had flung Kramm's portmanteau to the floor on the shadowy side of the hat-stand.

'Our boarding rates are eight dollars,' Mrs Hinkson started; 'but I'm sorry we have only a small bedroom vacant.'

'It'll do. I don't care how small it is. I'll go up to it, please,' said Lawrie.

But Mrs Hinkson was not a person of such hasty ways. She wished to know a little about her new guest, and perhaps she saw the dew on his brow when he nearly gave his name as Kramm. 'Ellis' also he shied at; and his ultimate mention of himself as 'John Simpson, madam,' was not a smooth achievement. His hand was in his left trousers-pocket, feeling at the undestroyed cloak-room ticket of Rutlington Junction. This flashed its inspiration at him.

To Mrs Hinkson, of course, one name was as good as another; but she asked for a week's payment in advance.

'Just as you like,' said Lawrie, and it was paid.

'Is that all your luggage, Mr Simpson?' inquired Mrs Hinkson in amiable jest, as she turned on the staircase and caught him snatching up Kramm's incubus.

'All I shall require here. I ex'— A ghastly misadventure cut his words. The portmanteau gaped, and from the dropping half rolled those two purple cheeses several yards towards the front-door ere he could overtake them.

The accident and his look of shame and anger afterwards amused Mrs Hinkson intensely.

'A couple of silly presents I—had to bring across the Atlantic with me,' he stammered. 'Couldn't get out of them.'

'What! from England? I reckoned you might be. But, sakes alive! what things to have—cheeses!'

They laughed together, but differently, until Lawrie showed impatience, and the climb was resumed.

In a few minutes he came downstairs, and 'calculated' he might not be in till bedtime, this his first day in America. He wanted to look around well. What he really wanted was to rave at large about life's mistakes and tragedies. There was a cupboard in his bedroom; Kramm's abominations were locked therein, and the key

was in his pocket. This was the only present mercy upon which his consciousness could fasten.

'Well, Mr Simpson, if that suits you, it will suit me,' said Mrs Hinkson, more than complacently.

Of Lawrie's experiences during this long day nothing sufficing may be said. They were mainly mental. He ate twice at restaurants, but his mind needed no stoking. It blazed all the hours on endless fuel, and especially upon the urgings of his reason that he ought to return to England without a boat's delay and administer his poor aunt's estate. The *Micah's* owners might already have investigated her luggage and cabled the sad news to him in Durnham. She had often told him to be prepared for such an advice from anywhere, at any time; it was the kind of energetic death she desired. Of course he ought to return. A cable to Trevor, startling yet matter of fact, and there would be no exposure of his breach of trust. Aunt Gracie had left fully ten thousand pounds, and he was her sole legatee.

He sat for a long time in the Central Park, struggling with this natural and legitimate inclination. It was so manifestly the thing to do; and yet when, about eleven o'clock, he was back in Lexington Street he had resolved not to do it. Aunt Gracie's ghost would, he knew, freely forgive him his precipitancy in thus seeking to save his reputation; but he didn't feel like it. Now that she was gone, his attachment to the old Durnham life was very faint. What he had done he had done, and the consequences he had apportioned to himself might follow. He had about ninety pounds in his pocket, and he liked better to think of beginning anew in a new land with this, and any name except Beedham or Kramm, than of sailing for England and the lies and hypocrisies which would have to be his portion in Durnham. With this intention firm in him, he rang the Hinkson bell and went to bed. The young man with thick, dull-red hair parted in the middle who let him in was given just time and no more to say jocosely, 'I'm Chris Hinkson, my mother's son, Mr Simpson!' and to ask if he was sure he wouldn't snap at something before turning in.

'Pleased to know you, Mr Chris Hinkson, and I've had my supper, thanks. Good-night,' said Lawrie, stepping for the stairs.

A frown at the cupboard which concealed the portmanteau soon spent itself, and presently he was sound asleep between the novelty of his bed's mosquito curtains.

The Hinkson breakfast-table in the morning was not more engaging in its invitations to appetite than the pleasant face Lawrie brought down to it. A good sleep had bucked him up, and he flattered himself that he was now like

the wise man who begins each new day as if there were no yesterdays, and to-morrows only possibly.

He made himself very acceptable to the breakfast-party of five—Mrs Hinkson in a bold, cool blouse; a Swede bound for Minnesota, but delayed in New York by its liquor bars; a rustic Mr and Mrs Bethel from Tennessee, in the capital for a week's excitement; and a white-haired, retired minister named Williams, the one permanent boarder of the house.

His appetite was as live as his spirits, and he made good play with the hominy and syrup, fish, cutlets, hot cakes, and coffee, until, after some free staring about the table, the Swede said that he would like some cheese.

'Why, how stupid of me!' exclaimed Mrs Hinkson. 'Of course you would. I forgot, Mr Ulrik. Such different habits people of different countries do have! But I must send out for it, unless'—she dimpled middle-agedly at Lawrie—'unless, you know, Mr Simpson.'

She laughed from the waist upwards—shook with it; and Lawrie's clouded countenance did but increase her merriment.

'A joke o' some size, ain't it?' inquired the Tennessee man, with moderate eagerness to be on to it; but before the question could be answered, in came the red-haired young Hinkson with a brisk 'Morning, all!' and an 'Ah! Mr Simpson, sir, you're the very feller I wanted to see.—I've been at No. 24, mother,' he added.

'What do you want to see me about—particularly?' asked Lawrie, heedless for the moment of his association with that No. 24.

'Did you cross in the *Micah*, sir?' continued Chris Hinkson.

'I did,' said Lawrie, uneasy again.

'Thought you might have. Well, a friend of ours was on her, and hasn't yet reached his home—a gentleman named Kramm. His sister's terrible afraid the crooks have got hold of him between then and now. She couldn't meet him, but she's seen the shipping fellers, and they say he landed right enough. Get to know him on board, Mr Simpson? He'd be second-class.'

This was rather hideous, but Lawrie bore it without a visible flinch. 'I do seem to remember the name,' he murmured.

'Poor Anna!' said Mrs Hinkson. 'She'll be feeling all to pieces, then, Chris?'

'Yes, little pieces,' said Chris.—'You didn't chum up with him, I suppose, Mr Simpson? Yeller-haired, short, fattish, about thirty, and smoked a pipe with a bowl as big as a duck's egg. Not a lot to say for himself; but that pipe of his—you'd notice that. A china bowl with painted figgers and trees on it!'

'No,' said Lawrie; 'I saw no one with such a pipe.'

'That's queer! But he was there right enough, and so something's happened to him.'

'Sakes, I trust not!' said Mrs Hinkson, as grave and concerned as her son.

'But why?' stammered Lawrie. 'Was he worth robbing?'

He marked the exchange of glances between his landlady and her son, and even a certain slight pursing of Mrs Hinkson's lips; but they told him nothing.

'I'm not saying he was,' said Chris. 'When they're in the mood, our Bowery toughs don't feel a feller's pockets before they down him. Wall, we'll hope better—that's so. Anythin' left for me, ladies and gentlemen?' He sat down sanguinely.

Lawrie finished his coffee and rose. 'I seem to be through,' he said; 'please excuse me.' He bowed and departed and was upstairs before Mrs Hinkson recalled her larder's shortcoming and his ability to make it good. But she was a lady with a glib tongue, and her other guests were soon being amused by the tale of those rolling cheeses in her hall.

'Do you think, Chris,' she said afterwards, 'you'd mind going and asking the Englishman if he'd sell us one of them, or half one? He was touchy about them yesterday, but he seems good-humoured to-day, and I'm sure he doesn't want them.'

'Very strange objects for a young gentleman like Simpson to bring with him!' remarked the old minister, his reverend eyes twinkling.

'I'll hear what he says, mother,' said Chris, jumping up. 'But perhaps he's a drummer in 'em, and they're his samples.'

'Take a knife with you in case,' laughed his mother, and Chris took a knife from the table.

He knocked at Lawrie's door and entered without further 'By your leave.' Lawrie was sitting on the bed. He had been busy with meditations about Kramm and this poor sister of his, whose anxiety about her brother was a sudden new weight upon his mind. He could dispel that anxiety, or at least change its character, and he wished to do so. But how was he to do it without confessions which he was exceedingly reluctant to make? Young Hinkson appeared opportunely.

'Ah, it's you!' said Lawrie. 'I've been thinking about your friend Mr Kramm. But what's *that* for?' he cried, starting from the bed and eying the knife.

'Not your blood, Mr Simpson. Don't be scared,' said young Hinkson, depositing the knife upon the dresser. 'Ulrik may wait and stuff himself with crackers. What about Mr Kramm, sir?'

'It's not so much himself as his sister. Is she the kind who worries badly? Some women do, you know. I'm sorry for her, but I've an idea that he's safe somewhere.'

'Oh, have you?' said young Hinkson. 'But'—he paused and contemplated Lawrie rather subtly—'there's reasons why she *should*

worry—strong reasons, Mr Simpson. I wonder if I'll like to tell you.'

'Yes, tell me,' said Lawrie.

Chris Hinkson shook his head and sat down. 'I don't think I ought, but I will. You're a kind-hearted chap, Mr Simpson, any one can see, and I reckon you won't give him away, will you!'

'Give him away!' Lawrie echoed. 'No; I promise I'll not do that.'

'Well, then, it's like this, Mr Simpson. He'll have about him the value of maybe twenty or thirty thousand dollars in diamonds. That's his line—diamonds. He's run by one of the big shops on this side, and—smuggles them in. There's a killing duty on diamonds in this country, and that's why it is. I've never asked how he does it, but I know that about it from Anna. If the toughs have got him it's because— See!'

'Well, of all things!' gasped Lawrie, surprised out of his discretion. 'He a diamond smuggler!' He turned to the window and remembered with perfect accuracy the visible contents of Kramm's portmanteau. 'A pretty dangerous game, isn't it!' he added.

'Yes; but with fat commissions, sir,' said young Hinkson. 'Anna's a dear little girl, and thinks a heap of me, and that's why I'm worryin' about Henrik too, d'you see?'

'Ah!' said Lawrie. 'She loves you, do you mean?'

'Just about. Yes. She's my Little Dutch, Mr Simpson, sure enough.' He rubbed his hands, and an expression of solemn-minded bliss stole upon him and continued there while Lawrie looked at him and remembered that simple letter from Cousin Jan and its extra-cousinly tenderness. A call from below reminded young Hinkson of the Swede and his needs.

'By the way, Mr Simpson,' he exclaimed, 'we're out of cheese, and my mother says you've got some.'

Lawrie coloured as if to a blow.

'Confound her cheek!' he panted, transported by a temper.

'Eh!' said young Hinkson; and his mouth stayed open.

'Sorry! That was a slip!' Lawrie broke into reckless laughter. 'She might have had the decency to forget about them; that's what I mean. So that's what this knife's for! Ha! ha! I must say it's funny. You folks over here don't mind asking for what you want, do you? Well, all right. Leave the knife and I'll cut you a chunk and bring it down.' His gestures were as wild as his words, and his sudden seizure of the knife at the end made Chris Hinkson retreat to the door.

'Say, Mr Simpson, what are you so raw about?' young Hinkson whispered.

But Lawrie's reckless fit was over. I don't know,' he answered, with a sardonic smile.

'It's a fact, I do not know. I get turns like that now and then. You shall have the stuff directly, though. It's the least I can do, to make amends.'

'Oh, don't trouble, Mr Simpson,' said young Hinkson, withdrawing delicately.

But Lawrie did trouble to that extent and more. The other and chief trouble was the perception in his legal mind that it might be a very serious matter indeed for him, in these enlightening circumstances of Kramm's mode of life, if his personation of that individual on the *Micah* and appropriation of his portmanteau were brought home to him. Fortune was playing him some pretty tricks this current year. Aunt Gracie's death was a sad one; but these others, from the Stock Exchange mishaps to this compound one of Kramm, were certainly neat specimens of the jade's powers as a double-dealer.

This swept him to the plain conclusion that he could stay no longer in the Hinkson establishment. 'But they shall have their blessed cheese first,' he said, with another laugh that had no right ring to it; 'whether Kramm's alive or dead they shall have it.' He would cut off a chunk of cheese, and, locking up the rest, would leave Lexington Street for ever. Perhaps go West in an hour or two. Perhaps anything!

He brought out the portmanteau, and taking out one of the purple scalps, clove it viciously. A second gash, and the yellow wedge came away in his hands. He fancied the knife grated against something in this second effort, and looked to see. And verily and indeed it was so. A gleaming crystal point protruded from the surface of the detached portion of cheese. A lustrous little facet showed elsewhere. On the other side of the wedge were three similar indications of exotic substance; and in about five minutes, without digging deep, he excavated with the knife no fewer than nine charming pea-sized diamonds from this mere sample.

He sat down with the diamonds in his palm and thought.

What craft on poor Kramm's part! Unlawful, but so clever! The whole method of it was bared to his imagination. Kramm had bought the diamonds in Amsterdam, taken them to the confederate farmhouse 'Little by Little' in his Dutch fatherland, and that ingenious letter from Cousin Jan to Cousin Anna, so guilefully left open, was to explain the dairy produce to New York's authorities if they chose to be inquisitive about them. Like enough—nay, probably—Kramm would have come ashore, with scant English and much emigrant stupidity on his tongue, carrying that unsuspecting portmanteau, and faced his risks with justifiable confidence.

Such was the pictorial sequence with which Lawrie's fancy indulged him by degrees.

Meanwhile the breakfast-party downstairs broke up. He heard the Tennessee man and

the Swede at gruff talk in the hall, and then the front-door closed twice.

Then some heavy, slow footsteps sounded on the stairs, and there was a tap at the door.

'Yes!' he said.

'It's only me, Mr Simpson,' answered Mrs Hinkson. 'I'm vexed if I've wounded your feelings, as Chris says I have.'

'You haven't,' said Lawrie. 'Don't think it, Mrs Hinkson. I'm going out very soon.'

'It was so inconsiderate of me, Mr Simpson! I see it now,' she said.

'Not at all,' protested Lawrie. 'Not in the very least.'

'Thank you for saying so, Mr Simpson.' This said, she went her way.

But Lawrie knew now what he would do before departing from Lexington Street, and he set to work to do it. In a little while he quietly descended the stairs and left the house with Kramm's portmanteau in one hand and his own little bag in the other, and got outside without interruption.

A few steps and he was at No. 24 in the street; and on his ringing the bell, the door was opened to him by a round-headed, flaxen-haired girl as obviously Dutch as the cheeses. She seemed prettily eager at first, but cried 'Ach!' when she perceived the portmanteau.

'Hush!' said Lawrie. 'I wish to see Miss Kramm.'

'But I myself am Miss Kramm!' she exclaimed. 'You have mine brother's bag.' She seemed in doubt whether to be glad or alarmed. 'Please come inside, sir,' she whispered, as if still uncertain.

Lawrie accompanied her into a parlour that was nearly as Dutch as herself and the cheeses, and began at once with good Samaritan consolation about Kramm. 'Before I tell you about this,' he said, raising the portmanteau, 'do let me assure you that, in my opinion, your brother is quite safe somewhere, and will perhaps come by a later boat.'

'Oh, yes, yes, that is so,' she said, with beaming eyes. 'I have heard. There was a telegram only just now. He is in the hospital in Liverpool. He was run over by a cart, poor boy! and they would not let him speak before because of his brain, which was hurt. But now he is better, and he will be here in a few weeks. It was such a long telegram, it cost something, I think. But how good of you, sir, to—to—bring it! He says it was on the ship.'

A blush, with her hesitation, added to her prettiness.

'Splendid!' said Lawrie. 'I congratulate you, Miss Kramm, with all my heart. It's a great relief to me too; though perhaps I'll not tell you why.'

He wondered if he was right in his guess why she blushed and looked so sweetly plaintive, and believed he was right.

'No,' he said, 'I'll only tell you this and be off. It was by accident that I discovered what was in the—you know—what was in your brother's luggage. There are some loose ones in paper, but none are missing, take my word for that. And now good-bye, Miss Kramm, and your brother's secret is quite safe with me.'

'Oh, but, sir!' she cried, tripping after him into the hall.

'No, Miss Kramm,' he said, as he opened the door, 'I would rather say nothing more. I'm heaps worse than he is—heaps.'

'But what is your name, sir?' she asked pleadingly. 'Won't you tell me?'

'That doesn't matter at all,' said Lawrie, with an encouraging laugh. 'Good wishes for you both!'

He marched straight for the cars and bustle of Ninety-eight Street at the bottom of Lexington Street, with only a slight inclination to turn and see if the pretty blue eyes were watching him. What he had done was well done, and he enjoyed the good cheer of this conviction.

(Continued in following section of this part.)

THE KISS OF PEACE.

THE silver aspen's leaf upcurled

In sweet young winds at play,
Long lines of shadow o'er the sward—

A fervent parting ray
That shines low through the tender green,
And twinkles like to gold;
It is the kiss of peace serene,
The call from field to field.

A clear bell-note chimes far, and dies
In sounds that seem to stay;
Through coolness 'neath the even's skies
The dark rooks wend their way,
The sparrows hop about the grass,
And twitter on the lawn;
What dreams of love and languor pass
The way that day has gone!

Ah yes, the toiler, brown with sun,
And with his toil so tired,
Hears sweetness in the winds that run,
And, by the sights inspired,
A love, a lilt, springs in his heart,
And to his lips a lay,
As, homeward speeding, children start
To meet him on his way.

'Back, dad,' I hear the little voice,
I see the fair young face.
I pray that ever may rejoice
Such love and youthful grace!
My path has been a way of tears;
But surely less they seem
While rest, and hope for others' fears,
Arise in evening's beam!

The sun has sunk. The soft, sweet breath
Of night brings from the wood
The smell of all sweet things in death,
All greening life renewed;
And then the stars come out, and light
With specks the wood, the way.
Oh blessed day! oh blissful night!
The Kiss of Peace away!

W. J. GALLAGHER.

Chambers's Journal

SEVENTH SERIES

THE OLD PAROCHIAL

By the Rev. D. C. STEWART, M.A.

IN the newspapers the other day I read of the death of an old parochial schoolmaster, amongst the last of his race. The announcement set me thinking of another, my old parochial, who for nine-and-twenty years was lord and master in the village school. 'Lord and master' was the expression he used, for he would say to some would-be rebellious pupil, 'While I hold the reins of government I will be lord and master in this institution'—which was but an example of his grand manner. For the old parochial could not brook to say anything in common style. He addressed us as 'ladies and gentlemen'; though there were occasions when we were dolts, dolberts, boobies, dunderheads, or likened to the wild *gauchos* of South America or the uncivilised denizens of the northern prairies. But even these uncomplimentary terms and comparisons were rolled out in the grand manner. It was not the grand manner of pretentious pomposity; it was the grand manner of one who, modest by nature and refined intercourse and wealth of learning, magnified his office.

At sixteen he had left the parish school to take a foremost place at the university of the west. Afterwards he had made his way to King's College, London, where in the absence of the professor he would conduct the class of Latin. From London he went to St Andrews with a view to the Church; but he was heterodox as to certain parts of the Confession, and his conscience was tender, though he would have been orthodox now. So he gave up the Church as a profession, tutored for a time in a well-known family, and through the influence of his patron was settled in a small school on the banks of the Clyde. Thence the marquis got him preferment to the last scene of his labours, a highly accomplished scholar who, when you suggested he was worthy of a far wider sphere, would modestly reply, 'I never thought I was equal to the occasion.'

But that was the man. Almost the last time I saw him—he was then eighty-three, but still in full vigour of intellect—I found him reading his *Thucydides*. As he reverently closed the book he said, 'I have been an ardent Grecian for some seventy years, and I am only now beginning to enter into the spirit of the Greek language. But, alas! the night is at hand; the sun is going

down. Mayhap, however, I shall be permitted to resume in the Elysian Fields.'

He knew the classics. Not a day but he read one or another of the 'great immortals,' as he would call them. He was a keen mathematician. Frequently you found him with a big slate on his knee, busy with a problem set in the examinations at Cambridge. It was at a time of holiday, when he was wrestling with an impossible deduction, that the maid next door said, 'The auld maister 'll sune be in the asylum. He's been sittin' in the garden for fower weeks tryin' to draw a three-barred yett.' Ancient history and Greek philosophy were things familiar to him. He could have acted as your guide through Greece or the Roman Empire; but one thing he knew little about, and that was modern geography.

When he left the little village by the Clyde, on his way to meet the heritors and representatives of the Presbytery prior to his last appointment, he carried with him a book entitled *Elements of Modern Geography*. But the wind was contrary, and the elements of the Clyde too much for him. 'What do you know of geography?' said the marquis in the course of examination. The dire moment had arrived. In one way only could it be faced. 'The word geography, my lord, is derived from two Greek words, *ge* the earth, and *grapho*, I write. It is a description of what is to be found on the surface of the earth, and in the bowels thereof. Geography and history, my lord, are twin sisters. To understand the one aright you must understand the other. To understand, for example, the history of Rome you must have a clear conception of the natural position of the ancient city; for it was that position which rendered ultimately possible the world-wide sway of the Imperium Romanum. From your classical knowledge your lordship knows that such is the case.' And the marquis said, 'That will do.'

He had a keen, untiring sense of duty. Four o'clock in the afternoon was the nominal hour for setting the seniors free. A gentle tap on the door which led from the dwelling-house into the schoolroom was a delicate hint from his considerate lady that the pupils should be suffered to go; but seldom did the old parochial give heed thereunto. A succession of raps, increasing in

[All Rights Reserved.]

MARCH 15, 1913.

force, not infrequently roused his ire, and he would say to one of his boys, 'Will you kindly go and ask that woman to desist from her noisy and most uncalled-for interruptions?' So on the spur of the moment he would speak of her. But when, three years before himself, she went, he said, 'The light has departed.'

To an indolent pupil he would quote, '*Horæ, et dies, et menses, et anni cedunt; nec præteritum tempus unquam revertitur*' ('Hours, and days, and months, and years go by; nor can past time ever be recalled'). 'It never returns,' he would continue, 'to me at least, hard though I have tried to redeem the golden hours; and far less can it be expected to return to you, so prodigal of precious moments. But, remember this, sir, these golden hours, with their lost opportunities, will stare you in the face at the judgment-bar of eternity.'

He had this keen sense of duty. Moreover, the acquisition of knowledge had presented few difficulties to him. And the two things combined produced his greatest weakness as an instructor of children—namely, a lack of patience and a lack of discrimination as to varying capabilities. So there were often tears when these should not have been, and corporal punishment not infrequently took the place of sweet reason. 'You should try moral suasion,' said an irate parent. 'Moral suasion, sir! Moral suasion with the members of your family! Have you never heard of the law of heredity?'

And yet there was a keen sense of humour which sometimes redeemed the situation. One day he was trying most ineffectively to infuse into the head of a farmer's daughter the distinctions between 'shall' and 'will.' Her stupidity increased with the increased attentions of her mentor. It was the depth of winter, and butter-milk was scarce. 'D'ye think, maister,' she ejaculated in a momentary lull—'d'ye think ye're needin' ony soor milk for bakin', for I could bring ye some the morn?' A smile came, and the stern tone gave place to something gentler. Patting her on the back, he said, 'Thank you very warmly.' Then he added, 'Kindliness of heart, my child, is more than all the rules of syntax.'

She fared better than a boy who under somewhat similar circumstances, and hoping to profit by a like experience, exclaimed, 'Oh maister, wad ye like my uncle Archie to bring ye a wee Bengal tiger frae India?' 'Sir,' was the scathing reply, 'so long as you are here there's no need for a Bengal tiger.'

He said bitter things, but as he once remarked to me, 'I had the unfortunate faculty of being able to say them.' To a lame man with a vile tongue he said, 'Sir, you have got the foot-and-mouth disease.' Of another man, who had given over wheeling his father-in-law in a bath-chair after the father-in-law had been involved in finan-

cial disaster, he exclaimed, 'Depend upon it, in Hades the miserable fellow will be condemned to wheel a perambulator.'

His irony in the schoolroom was magnificent. Fortunately it was too delicate for some to understand, but often we understood and felt it, and many vowed that the day of reckoning would come. But the day of reckoning never came, for the virtues of the man were greater far than his failings, and in the clearer light of after years the virtues shone forth, and a wonderful satisfaction that we had come into close touch with a marked personality obliterated the scars of former days.

'When I left your school,' said a young man who had prospered in the south, 'I vowed I would come back to kill you. I've come back to-night to pour blessings on your head, and I wish you to accept this grateful gift.' And tears came into the old man's eyes. The kind remembrances of former pupils were of the things which passed not away.

Though stern and aloof in school, he was in private life one of the most approachable and kindly of beings. So the parishioners came to consult him on divers matters. He composed most of their speeches. In critical times he would write their letters.

When John Smith had his farm taken over his head he made his way to the old parochial. 'D'ye think, maister, ye could write a bit letter to her leddyship? If you pit a bit letter thegither I'll try to copy't, and me and you thegither'— 'The first personal pronoun singular should never, sir, precede the second. It is deemed egotistical in good English, whatever the usages of other languages, either ancient or modern.' 'Your way be't, maister. Ye'll write the letter an' I'll copy't.' So the old parochial wrote to the effect that it was not the material loss, heavy though that would undoubtedly be; it was the severing of a tie which bound him (John Smith) to a venerable, illustrious, and well-beloved family. Her ladyship replied, in her own hand, that John Smith was to remain undisturbed for life. She added, however, taking a certain liberty with her Biblical quotation: 'The hand is the hand of John Smith, but the voice is the voice of the parish schoolmaster.'

He was fastidious in his choice of words. He was equally careful in his pronunciation. When his good wife died a neighbour called to condole with him 'Man, maister,' he said, 'is this no' lament'able?' The ear of the grief-stricken man rebelled, and the maister said, 'The accent is on the first, not on the antepenultimate, syllable. The word, sir, is lam'ent'able.'

This nice discrimination produced one of his lifelong regrets. He had by him a versior written in his college days for which he had stood second. But one of the sentences was marred by a great unforgiven defect. The first

ablative absolute should have been turned by *quum* and the *subjunctive*. This *quum* and the *subjunctive* were to him one of the great 'might-have-beens.'

He always had, however, a partiality for the ablative absolute. 'Get a clear understanding,' he would say of the ablative absolute 'and you have to a certain extent mastered the Latin language. I say, "to a certain extent," for no modern can master that imperious language. Get a clear understanding,' he would repeat, 'of the ablative absolute, and if you wish to do that read and re-read your *Cæsar*. Some of the upstarts of these days affect to despise *Cæsar*. If ever, sir, you hear any one say that *Cæsar* is easy, attribute his statement to crass ignorance. To understand the exact situation, to give the true rendering, never can, at this time of day, be an easy matter.'

He had a supreme contempt for the more modern aids, the too elaborate notes, the keys, the 'ready-made-easies.' 'Spurn these,' was his advice; 'spurn these as inventions of the Evil One. And ransack your vocabulary. By all means ransack your vocabulary. And, oh, be careful of your quantities!' (Of which punctilious care the old minister knew full well. Did he not one Monday morning call at the school to apologise for having lengthened the 'y' in *Euroclydon*?) To a newly entered pupil, a youth whose quantities were bad, he said, 'I trust Julius Cæsar may not have heard you; for, if so, then should it be your lot in the next world to fall in with him, by Jupiter! you will meet with condign punishment for thus maltreating the Latin tongue.'

For many years he was registrar for the parish. With what minuteness, with what exacting care, he kept the books! He would spend hours over a couple of entries, labouring away in his bold calligraphy. If there was the slightest smudge of ink he would sadly exclaim, 'I have marred the page,' and during that night there would be sleepless hours. The books were his country's care entrusted to him to be records for the years to come, and he trusted that succeeding ages would not speak ill of him. I remember seeing him tackle a ploughman whose signature had transgressed the allotted bounds. Administering a box on the ear, the old parochial exclaimed, 'Sir, have you no regard for the annals of your country?' Then the old parochial, sparely built, five feet five inches in height, took John Thomson, six feet three inches, and built proportionately, by the lapels of his coat and shook him as a terrier would a rat. As the ploughman left, the repentant registrar ventured an apology. 'I was somewhat hasty, John.' 'Man, maister,' never mind. I thoct I was back at the schule. But, by heavens! ye're the only man that wad tak' such liberties wi' Jock Tamson.'

But that was the case with them all. When Will Smith and Sandy Allan—well over forty

years of age both of them—were on a Fair Night engaged in hostile combat in the centre of an admiring, excited ring, the maister, coming up from the reading-room, espied them, and shouted, 'William Smith and Alexander Allan, how dare you? Come here, sirs!' Meekly they obeyed. 'Go home, sirs!' And William Smith and Alexander Allan looked for their bonnets and took their respective ways.

Talking of his duties as the parish registrar reminds me that the census-time was a period of great anxiety. Long before the fateful day the enumerators were schooled as to their duties, and severe were the comments of the parochial upon their subsequent errors, minute or glaring. To an enumerator whose self-confidence was in inverse proportion to his ability, he said, 'In the infernal regions, sir, you will spend eternity meditating upon these errors. I shall add nothing to augment your well-merited punishment.' In after years this was one of the enumerator's most refreshing stories, as he recalled the scene and admired the delicious kindliness of heart which refrained from augmenting eternal punishment.

It was a strenuous place, as may be gathered, that village school presided over by stern duty. There were occasions upon which discipline was relaxed, though these were few. There were times, as I have hinted, when the keen sense of humour would be suffered to assert itself. There were the thunderstorms, too, which were somewhat frequent in the valley. The old parochial's was a sensitive, reverent nature, and the flashing fire and the rolling thunder were manifestations of the awful power of the Almighty. 'Ladies and gentlemen,' he would say, 'this is a fitting occasion upon which to use the word "awful." The decadent age in which we live applies the word to insignificant details of ordinary everyday life; but the word should be reverently reserved for speaking of the majestic might of God.' As the lightning flashed more vividly, and more loudly rolled the thunder, he dropped the reins of government, and pandemonium ensued. But when the last echoes died away among the hills he would exclaim in his stentorian voice, 'Ladies and gentlemen, how dare you?' And the scholars scurried to their seats, and silence fell upon the place.

There was, too, the annual occasion when a bunch of flies, dressed by a famous fishing-tackle-maker on the Border, came, a present from a former pupil. Even *Cæsar* was forgotten, or *Virgil*, or *Euclid*. The maister put on his best spectacles. One by one the flies were held up to the light. 'Ah, these *are* flies!' he would say. In anticipation he was on the river; the oblivious minutes passed, and he heard not the uproar. But when the last fly was carefully replaced silence fell again, for once more he shouted, 'Ladies and gentlemen, how dare you?'

It was a heavy task the old parochial had, ofttimes single-handed, and some ninety or a

hundred pupils to be instructed. We knew nothing of many of the multifarious extras of the modern curriculum; but the three R's, with grammar and geography and religious knowledge, were carefully taught, and the apt pupil who wished to do so could prepare himself to take an honoured place at the university. Out from that little school there went not a few who in after years made their mark in the professions or in other walks of life. But it must be remembered that the village then was somewhat isolated, and isolation is the mother of ambition.

When the Education Act of 1872 was passed some one asked the old parochial what he intended to do. He replied, 'I think the best thing to do is to take out all the old parochials, place them in a row, and mercifully shoot them. It is too late for us to come under a new régime. And it would pain our hearts to say good-bye to the scene of our labours, and know that others ruled where we were wont to hold undivided

sway.' Then he added more practically, 'I, at least, shall retire. I would never condescend to have some whipper-snapper come into my school, and on the strength of a couple of hours' investigation pronounce judgment upon the whole work of a year. There are things, moreover, too elusive for the passing visitor, and the true aim of education is the building up of moral and spiritual beings.'

So, with a sad heart, he laid down the 'reins of government.' But there remained the 'great immortals' and his 'three-barred yetts.' And old pupils would come to see him, and there were those of his own around him. Thus the years glided by, and at length he passed to the Elysian Fields. That's long ago. '*Eheu fugaces, Postume, Postume, labuntur anni!*'

Still, at this lengthening distance, there are not a few who in the inner sanctuary of their being reserve a place for the memory of the Old Parochial.

ATLANTIC GOLD.

CHAPTER IV.

ARCUS came to himself in a room whose walls and ceiling were of narrow planking enamelled white. The floor was covered with a Turkey rug and a 'surround' of olive-green linoleum. The bed he lay on had been built against the wall, bunk-fashion, and was also enamelled white. The furniture consisted almost entirely of pieces of veritable Sheraton—bureau, writing-table, bookcase, chairs. Only the comfortable-looking couch was of modern make. Under it lay a pair of slippers with 'Louis' heels. A couple of delicate water-colours in narrow gilt frames did more than relieve from monotony two of the walls. Electric bulbs, shaded, depended from the ceiling over bed, bureau, and writing-table. There were two doors, one of which stood wide to a dressing-room. A fireplace was not in evidence. The window, which opened outwards, had curtains harmonising with the blues of the carpets.

At the window a girl was standing, engaged apparently in watching bleak rocks, an angry sea, a drear sky. You would have called her good-looking rather than pretty. Nature had not been slipshod in its moulding of her features; each had a perfection of its own, albeit Nature had omitted the little final touch (or whatever Nature calls it) which, though it may spoil one or more features in themselves, yet leaves the face lovely as a whole. This was a girl who would be a handsome woman long after days of prettiness were ended. Dark-haired, gray-eyed, ruddy of lip, softly browned by sun, wind, and sea, slim and supple of body, she had charms enough now, at the age of four-and-twenty, to please any eye but the dullest. She wore a

white linen blouse, a dark-grayish tweed skirt cut rather shorter than was the fashion, and high laced boots of tan with sturdy soles.

She had been at the window for some ten minutes when the man on the bed stirred. She saw his eyes open, wander about the room, and finally linger on herself. For a moment or two she hesitated, her colour increasing, then stepped toward the bed.

'You are awake?' She spoke in a somewhat formal tone. 'Do you feel better?'

Arcus stared. 'I beg your pardon,' he said at last; then, half-remembering, 'Where am I, please? Have I been ill?'

'Not ill'—her voice came more easily—'but very tired and bruised. Does your head ache?'

'A bit heavy and queer, but'—He halted. 'I don't understand.'

'Don't trouble about understanding just now. You must be hungry. I am going to get you some tea. Hubert should attend to you, but this is one of his busy hours. Please keep still. I shall not be long.'

As the door closed upon her Arcus raised his head in order to gain a better view of his surroundings; but he was glad to lay it on the pillow again. The accident, the wreck, the escape, came back to him.

'Civilisation, anyway,' he muttered, noticing the quality of the bed-linen, the texture of the pyjamas he wore. 'Gad, I'm thirsty!'

His nurse did not keep him waiting.

'I think you ought to take this powder first,' she said, leaving the tray on the table, and approaching him with spoon and glass. 'I'm sure your head hurts. Stay; don't lift it till

I get cushions.' She fetched them from the couch, and slipped them under his head with a certain gentle awkwardness and haste.

Arcus may not have noticed the awkwardness, but he regretted the haste. His mind was clearing rapidly. He swallowed the bitter dose and thanked her.

Responding to her inquiry, he took sugar but not milk with tea.

'I'm rather glad of that,' she said, 'because we have only condensed milk on the island.' She brought him the cup, also thinly cut home-made bread and butter.

'The island?'

She smiled slightly. 'Don't you even know that you are on Laskaer, or rather on one of the Laskaers? There are three; but we call this one, the largest, Laskaer, and the next one the Other Island. The third is merely a rock. My uncle is on the Other Island at present. He was storm-stayed yesterday evening. The storm came very suddenly, did it not? Am I talking too much? Does your head?'

'There's not much the matter with it. Please don't stop. I am eager to get my bearings. The last thing I remember was looking in at a window. Some one was writing—you?'

She nodded, flushing a little. 'I could not sleep last night. I was anxious about my uncle; though it is not the first time he has been caught on the Other Island, and he has a comfortable hut there for emergencies.'

'I must have alarmed you when I knocked. I suppose I did knock?'

'I was startled, but not alarmed then. I thought my uncle had risked the passage, and I was angry with him. But when I opened the door I was alarmed of course. I thought you were—dead. Then Hubert came and assured me you would soon be all right. He got you to bed, and you have done nothing but sleep—and grown a little.'

'When was that?'

'About four in the morning. It is now a little after five in the evening. You have had a good sleep. I should tell you that Hubert saved some of your things—a bag and a dressing-case—from the wreck. They are in the dressing-room next door. Most of your clothes are dry now.'

'You are too good,' said Arcus. 'I must apologise'—

'Please don't. I am really very glad to see you,' she returned simply. 'You are our first visitor, or, rather, guest, and we have been here for nearly three years. There is no one else on the islands.'

'Fortunate for me that you were here! Allow me to introduce myself. My name is Stephen Arcus. When I am in this country, which is not often, I live at the Caradoc Club in London. I have no very near relations, and no fixed place of abode. I have a few friends who

would, I believe, guarantee my respectability. The breaking down of my motor on the way to West Loch Tarbert and the storm account for my presence here.'

'Thank you, Mr Arcus. My name is Florence Helmsdale. My uncle is Dr Victor Helmsdale. He is my nearest relation, and has taken care of me for a good many years. Let me give you more tea?'

'A thousand thanks! It is making me feel as fit as a fiddle.' He watched her as she crossed to the table. 'Dr Helmsdale is a man of science, is he not?' he ventured.

'You have heard of him?'

'Curiously enough, in the hotel at Portree the other night, a man mentioned that he had heard of a professor who had taken up his residence on an island west of the Hebrides.'

'Some whalerman or fisherman has been telling tales,' she said, refilling his cup. 'Was that all the man told you?'

'Well'—He paused.

'Nothing about gold from sea-water?' She laughed softly as she set down the teapot. 'Mr Arcus, my uncle makes no secret of the nature of his work here. He will be glad if he finds you are interested in it; though I can't promise that he will show you exactly how the gold is got. I have never seen the whole process.'

'He gets the gold!' Arcus exclaimed. 'I beg your pardon, I ought not'—

'Oh, I have seen the gold, but not the whole method of getting it. I'd just as soon not know that. But the few strangers who have landed here have gone away smiling. No doubt they think he is mad. It amuses Uncle Victor. Try to eat some more bread, please. Dinner is not till seven-thirty.'

'Forgive me,' he said, taking the cup from her smooth, brown hand; 'but aren't you rather indiscreet in talking to an utter stranger about—gold?'

'The way you say "gold" reassures me, Mr Arcus,' she answered, smiling. 'Besides, I don't think my uncle would mind very much if all the gold now on the island were taken away. He has still the Atlantic and the other oceans. But I must leave you to rest. Hubert will wait upon you in a little while. Ask him for anything you want.'

Arcus would fain have detained her, but not merely for the sake of obtaining some further information regarding his novel situation and surroundings. 'I shall get up in five minutes,' he said.

'Stay until Hubert comes, and see how you feel then, Mr Arcus. My uncle said we were not to allow you to take risks.' Noticing his wonderment, she said, 'Oh, I forgot to tell you that the rain-mist cleared for a few minutes this afternoon, and he and Hubert signalled to each other. So be careful, please.'

With a smile, which Arcus found himself hoping was really friendly, she left him.

An hour later appeared Hubert, a big, middle-aged man, fair, blue-eyed, ruddy, and of clean-shaven, amiable countenance. He greeted Arcus cheerfully, betraying a mere trace of a foreign accent.

'Glad to see you looking so well, sir! You had an escape last night—this morning, I should say. Now, can I do something for you?'

Arcus expressed his thanks for what had been done already, and his intention of getting up.

'With your permission, sir!' said Hubert, and proceeded to examine the guest's bruises, doing his work with the hands of a prize-fighter and the touch of a mother. 'Yes,' he said at length, 'it will do no harm to get up for dinner. The knee will be stiff and the shoulder may hurt; the head is the worst, but luckily there is no deep wound. Shall I prepare the bath now?'

Later Arcus enjoyed the luxury of hot water in which a flask of sweet vinegar had been flung. He emerged from it still shaky, but much comforted in body.

Hubert assisted him to dress. The man was ready enough to talk. 'Yes, sir,' he said in response to a remark from Arcus, 'it is a Norwegian house—built in Norway and brought here in pieces, numbered. Very comfortable house, sir.'

'You seem to have every luxury,' said the visitor, as the other switched on the lights. 'Where do you get your power?'

'Oil, sir. We burn nothing but oil—great tanks holding six months' supply. The yacht calls every month in the summer; but for four months in the winter we do not see her.'

'The yacht?'

'The doctor's steam-yacht, sir. A fine vessel. He used to sail in her very much; now she only brings stores and so on.'

'You have no regular communication with the shore?'

'No communication at all, sir. I dare say by signalling we could get a whaler or a trawler to call. We have never needed to do so. But we do not see a ship every day. We are off the track. In the early part of the summer we may see whalers going north, but seldom so late as this. Last year I saw but one. They get most of the whales farther south. Ah, the shoulder hurts! Let me hold the sleeve—so! To-night it shall have some embrocation. Your things are not much damaged, are they, sir? The cabin of your boat came off best—the stern is in pieces. You made a fine escape.'

The man appeared desirous of hearing of the adventure, and Arcus gave him the main incidents.

'Ah,' Hubert remarked, 'you have to thank the wind for blowing the way it did. And, if you will excuse me, sir, we too have to thank it. The life here is good for a man like myself, but it has too little change for a lady. And the doctor has been too busy lately. He will be glad to see you. A wonderful gentleman, the

doctor! Well, sir, how do you feel now? It wants just half-an-hour till dinner. Shall I bring you sherry-and-bitters or vermouth?'

Arcus absently declined an *apéritif*. He eyed the slippers under the couch. 'Have I been occupying Miss Helmsdale's room?' he asked.

'Another has been prepared for her. Permit me to show you the sitting-room. One moment.' Hubert spoke from the door, touching two plated handles, one of them on a dial, upon the wall. 'This is for regulating the heat; this for the ventilation.'

'More luxury!' laughed Arcus.

'All planned by the doctor. If you please, sir, I will now show you the way.'

They crossed a square hall, enamelled white, carpeted with an Indian rug, lit by bulbs in ruby globes. Against two of the walls were large pots of chrysanthemums.

The room Arcus entered was also white, the colour-scheme of the furnishings being lilac and lemon-yellow. The curtains were drawn. The table was laid; fine linen, silver, and crystal shone and gleamed under a pale gold light. The pictures were again water-colours, and Arcus promised himself pleasure from them in daylight. A baby-grand piano stood in one of the corners.

He seated himself in a lounge-chair, and was glancing at the heap of September magazines on a small table at his side, when Miss Helmsdale came in. She had changed her blouse and skirt for a gown of silver-gray silk. She wore a brooch—a bar of platinum set with three diamonds—but no rings. Arcus noted the latter fact.

'You see we are not so hopelessly out of reach here,' she said, indicating the magazines. 'The yacht brought them three days ago.'

'Three days ago!' he repeated. So perhaps he would be a prisoner on the island for practically a month! His heart leapt and sank. What about Anstruther! How was he to communicate with his friend?

'Her next visit will be in October, and then we shall not see her again till March.' Miss Helmsdale's voice was slightly wistful.

'I cannot inflict myself upon you and Dr Helmsdale for weeks,' said Arcus, seating himself opposite her. 'Although, as Hubert has informed me, few vessels come near the island, there must surely be some means— You could lend me a small boat perhaps?'

'Have you not had enough of small boats? But, seriously, I don't think my uncle would allow you to risk your life in his little boat; he had a larger one, but it got smashed during a gale a fortnight ago. We used it for fishing. The yacht is bringing a new one next month. You are nearly thirty miles from the coast of Harris, Mr Arcus, and you cannot trust the weather. Don't consider the idea of getting there in an open boat.' She paused till a thought seemed to strike her. 'But your friends will be dreadfully anxious. Forgive my forgetting that.'

'I have only one friend who knew that I had actually started on the trip. For several reasons he may be concerned at not hearing from me. Don't think me ungracious, Miss Helmsdale. If it were not for that friend I should consider it the greatest luck in the world to have been cast ashore on your island.'

Possibly her voice was colder as she replied, 'You must consult my uncle. I hope he may be here to-morrow. To-night the sea is as rough as ever. After to-night we shall keep a bright lookout, and perhaps we may attract the attention of a vessel before long.'

Arcus, glancing at the proud face, did not venture to protest that only his conscience could mar the prospect of a long stay on the island. He begged her to tell him something of the island itself.

While she was describing the Laskeirs, Hubert, in dazzling-white jacket and apron, entered with the soup. The dinner that followed, though limited to four courses, was worthy of a Piccadilly restaurant. And at precisely the right moment Hubert brought the guest a pint of '93 Pom-mard, warmed to precisely the right degree. Miss Helmsdale drank nothing.

'You must forgive my talking so much,' she

said; 'but it's so long since I have spoken to a person from the big world! However, it is your turn now, Mr Arcus. Tell me about London.'

The meal ended with Neapolitan ices.

'I know it's rude to make remarks,' said Arcus; 'but all this on a lone isle in the Atlantic savours of magic. I'm beginning to wonder if last night was real. Shall I wake up to-morrow and find myself on the cold beach?'

Miss Helmsdale laughed. 'Hubert is clever, isn't he? My uncle calls him a wonderful man.'

'That is what Hubert calls your uncle.'

'I believe you will agree with Hubert,' she said gravely. 'Poor Uncle Victor! to think of his supping out there alone on tinned tongue and coffee. But at the hut he has an open fire, which I rather miss here. Listen to the wind!' she continued. 'Surely it will blow itself out before morning!'

Once more Hubert appeared, and set coffee and cigarettes on a side-table, and presently hostess and guest were carrying on the conversation from easy-chairs.

It must be confessed that just then Anstruther was not prominent in his friend's thoughts.

(Continued in following section of this part.)

WIRELESS SYSTEMS.

By Captain C. G. CRAWLEY, M.I.E.E., Royal Marine Artillery.

PUBLIC interest in wireless telegraphy has recently received a great impetus from the publication of the evidence given at the inquiry of the Select Committee of the House of Commons into the Government contract for a chain of imperial wireless stations; but there are many who, not possessing any special knowledge of the subject, may perhaps welcome a short explanation of the fundamental differences between the various systems which were so prominently discussed.

It is not intended, nor would it be possible in one short article, to do more than touch on the general principles of wireless telegraphy, which are founded on Hertz's classical investigations into the production of electric waves in 1886-87, and which first assumed a practical form some ten years later as a result of the experiments of Mr Marconi, with whose name this means of communication must for ever remain associated.

Wireless messages are sent by means of electric waves just as heliograph or flashing-lamp messages are sent by light waves; and, the 'all-pervading' ether being the medium of propagation in both cases, the speed of travel is the same—namely, one hundred and eighty-six thousand miles a second. These wireless—or, as they are usually called, Hertzian—waves cannot produce directly the sensation of light, as such waves are much longer than those which are called light-waves.

For the same reason they cannot produce the effect of other known ether-waves, such as heat, actinic, or X rays. The propagation of sound, being due to wave motion in a denser medium, has of course no sort of connection with any of these ether-waves.

Hertzian waves have the property of producing oscillatory electric currents in a conductor of electricity, and it is this property which enables their presence to be detected, and so permits of the reception of wireless messages. An oscillatory current is one which oscillates to and fro at a very high speed, of the order of, say, a million or some hundreds of thousands of times per second. For the purpose of receiving messages, one or more wires, called aerial wires, are suspended from masts, and form the conductor in which the oscillatory currents are produced by the action of the Hertzian waves transmitted from the distant station, and these currents work various electrical devices which ultimately produce effects which can be either seen or heard. The oscillatory currents received last only as long as the waves which produce them, so that when waves are sent for short or long periods the receiving instruments respond for corresponding periods, thus reproducing at the receiving station the dots and dashes of the Morse code which were made by the signalling-key at the transmitting station.

In systems which make use of continuous waves the action is often somewhat different, as the transmitting system may radiate a continuous stream of waves during the whole time that the station is in operation, as opposed to the finite trains of waves which are radiated from a spark system whenever the key is pressed.

For such continuous wave-systems, therefore, arrangements are made so as to alter the form of the waves during the time that the key remains pressed, these alterations affecting the instruments at the receiving station for short or long periods of time corresponding to the dots or dashes made by the signalling-key at the sending end. This means that devices designed specially for the reception of spark-systems are not the most suitable for receiving these continuous wave-systems, and *vice versa*.

There are numerous detectors and receiving devices used and patented by the various systems; but these can hardly be said to form the important distinctive features, as all spark-system receivers are suitable for any spark-system, and all continuous wave-receivers are suitable for any continuous wave-system.

We will, therefore, turn our attention to the methods of producing wireless waves, as it is in this respect that we find the main differences between the various systems.

Hertz proved by his famous experiments at Karlsruhe, already referred to, that when a condenser, such as a Leyden jar, charged with electricity, is discharged, under certain conditions, across an air-gap, an oscillatory current flows in the discharging circuit, producing an oscillatory spark across the gap, and creating electric waves, which radiate into space. These facts form the basis of all spark-systems of wireless transmission.

For practical signalling it is necessary to produce the oscillatory currents in an aerial wire suspended from masts, and it is essential to employ high masts if radiation over great distances is required; whereas for receiving, height is not of such vital importance, provided that very long aeriels can be used. If it is permissible to concentrate the radiation mainly in one direction, Marconi found that the height of the aerial might be reduced, provided that the length could be increased in the line of propagation, and that form of aerial is one of the distinctive features of a long-distance Marconi installation both for transmission to and reception from a definite direction.

Marconi originally connected the aerial to one side of the spark-gap and 'earth' to the other, so that the aerial and the 'earth' formed the two plates of the condenser corresponding to the inner and outer metallic coatings of the Leyden jar. In this arrangement each wave-train is heavily damped—that is to say, it dies down very rapidly; and it was soon found that such wave-trains do not permit of selectivity at the receiving station; and unless a receiver is selective for

the particular wave-length of the message required, it will be 'jammed' by messages being sent on other wave-lengths. The 'plain aerial' method, as it is called, has therefore been abandoned, and is not now used in any of the spark-systems.

The present Marconi system uses a condenser spark-gap circuit to generate oscillatory currents, which induce similar currents in the aerial wire, which is accurately tuned to the same natural electrical period as the generating circuit.

The inductive method used for producing oscillatory currents in the aerial, combined with the fact that the circuits are in tune, is most important, and judgment has been given in several legal actions to the effect that it is one of the distinctive features of the system.

Another outstanding feature is the form of spark-gap employed, which is so arranged that the length of gap is variable in such a way as to control the length and duration of the spark, as well as to regulate the number of sparks per second. This arrangement, in conjunction with the method of inducing the oscillatory currents in the aerial, produces not only comparatively undamped wave-trains which permit of more selective receiving, but also gives the Morse code signals a distinctive note when heard in the receiving telephones, and this is of great assistance for distinguishing the required signals from other signals and from atmospheric disturbances.

The Telefunken system induces the oscillatory currents into the aerial in a similar manner to that used in the Marconi system; but the aerial and spark circuits are not absolutely in tune with one another, and the spark-gaps are of a different type. The Telefunken system uses a number of very short spark-gaps, the electrodes, or sides of each gap, consisting of a large metal disc, an arrangement based on investigations carried out by Professor Wien, of Dantzig, in 1904-5. In this system the spark dies away very rapidly, and for that reason is called a 'quenched spark'; but the oscillatory current in the aerial, and therefore the wave-train radiated, continue long after the spark has been quenched, so that the wave-trains are, comparatively speaking, undamped. This system produces in the telephones at the receiving station a distinctive musical note which has the advantages referred to in the case of the Marconi system.

These two, the Marconi and Telefunken, are the foremost spark-systems; and it is outside the scope of this article to mention others, though there are several which present features of considerable technical interest.

Spark-systems, headed by the Marconi and the Telefunken, have held the field so long that wireless—or, as it is officially called, radio—telegraphy is frequently referred to as 'spark-telegraphy'; but this expression can no longer be used as synonymous with the other two, as there are now a number of stations working

commercially on a system which does not use a spark at all. This system is called the Poulsen system, and is the outcome of experiments carried out by Dr Poulsen in Copenhagen in 1903, based on the results of experiments in England by Mr Duddell, published in 1900. In this system an electric arc is used instead of a spark, the arc being placed either in the aerial, like Marconi's original plain aerial spark, or in an influencing circuit somewhat similar to that used in the Marconi system. The waves radiated by either of these arrangements are very nearly continuous, and the system is called a continuous wave-system.

The only other continuous wave-system which calls for mention here is the Goldschmidt system, based on the results of experiments carried out in Berlin by Professor Goldschmidt during the last few years. In this system the rate of alternation of a current generated by an alternating

current machine is increased by electrical devices to such a rate as is required for the production of wireless waves; that is to say, an alternating current is stepped up in speed of alternation until it becomes an oscillatory current, which is then applied directly to the aerial wire. This system is being rapidly developed, and is said to have great possibilities; but it is not yet in use for commercial communication.

There are other continuous wave-systems, but the majority have scarcely yet emerged from the experimental stage. Their progress, however, demands the careful attention of all interested in the subject, for not only are continuous waves, or at any rate trains of very persistent waves, advantageous for wireless telegraphy communication, but they are essential for wireless telephony, which, though still in the experimental stage, will no doubt very soon be claiming more serious attention.

THE DIAMOND SMUGGLER.

CHAPTER III.

THE enjoyment continued, though diminishingly, until Lawrie was on the Brooklyn Bridge; but there it ended. The sight of the shipping in the river gave him pangs about himself and Aunt Grace. It hurled him back upon his past distressingly, and he was soon wishing with all the futile ardour of his Ridley mind that the last three months of his life could be blotted out. Such a fool he had been, yet only since the middle of April! The Stock Exchange slump which wrecked him had opened in the merry month of May, and—who'd have thought three months ago that by the 22nd of June he, Lawrie Beedham, would be an absconding felon in New York, half-disposed to terminate his earthly career from the Brooklyn Bridge?

He was bitterly repentant in these black moments. A little more, however, and he was making for the docks with his head up and a brave light in his eyes. He would not drown himself like a craven; neither would he go West with the few hundreds of dollars in his pocket, each of which ought to cry 'Thief! thief!' to him as he spent it. Better to return to Durham, steerage, and do his penitential time like a man. With Aunt Grace gone, there was no one's feelings in the matter to consider except his own. Right to the landing-stage of the day before he maintained this worthy frame of mind, supported enthusiastically by his Ridley imagination, which gave him glimpses, and more, of a future beyond the broad-arrow period which should nobly atone for the ignominious meantime.

Here he allowed himself to be distracted. A three-funnelled steamer was alongside, and the passengers were filing ashore. She was the *Lodore*, a Waterfall liner, and he remembered

that he had had thoughts of crossing in her instead of the *Micah*. What a difference it might have made to him! No Kramm, and the tragedy of Aunt Grace's death spared him!

His eyes were on the people, and he was trying to engage himself with conjectures about the betterness or otherwise of things as they were, when all in an instant he felt like fainting. It was due to a passenger on the gangway, with a ship's officer in smiling attendance upon her. In fact, Aunt Grace herself, or her materialised ghost, in the old ulster. Yes, and the gaitered feet of useful size which he knew so well.

He mastered the fainting sensation and went nearer, pale and absorbed, hurried and met her almost as soon as his dear square-toed boots were on American stone. She was wearing a beehive brown straw hat which didn't suit her a bit, and she had nothing in her hands until Lawrie's face was there.

'The Powers be good to us!' she whispered softly. 'It's Lawrie!' She seized his face and kissed him—three loud kisses! 'My dearest boy!' she then exclaimed, 'what are you doing here, and where's your moustache!'

Lawrie's hand sought hers. 'This is glorious!' he said very humbly. 'It really is you!'

'Why, of course it is, my dear. There aren't two of me in the world, I'm sure. But how truly delightful, Lawrie, to'— She turned to the officer at her elbow. 'A piece of unexpected luck, Mr Clinton. This is my nephew, Mr Beedham.—Mr Clinton, Lawrie, has been awfully good to me; so has every one on the *Lodore*.—But that's another story, isn't it, Mr Clinton?'

The two men shook hands, sunned by her smiles.

'Your aunt, Mr Beedham'—began the *Lodore's* officer, with twinkling eyes.

But Aunt Gracie interposed. 'You are not to tell him, Mr Clinton,' she commanded. 'Don't forget I'm at the "Bristol;" and *au revoir*, my dear friend, and ten thousand thanks again to you and every one.'

'Mr Beedham wonders for what, by the look of him,' said Mr Clinton, cap in hand and apparently much amused.

'Let him wonder,' said Aunt Gracie merrily. 'Mind, I expect you, and the captain, if he can so honour me.—Now, Lawrie.' She turned and took his arm. 'Let's get a car, and—tell me what it means, my dear boy. You don't look at all well, and I'm so sorry you've shaved your moustache. But that's nothing. I've had the most exciting times myself, and it is such a pleasure to see your dear face again, anywhere. By the way, my luggage preceded me, so we've nothing to bother about. They'll see to it at the hotel. But fancy meeting you *here*—like an angel from the skies—Lawrie!'

The Customs delayed them only a minute. A patriarchal fellow-traveller from the *Lodore*, wearing a cowboy hat, franked her through the ordeal. 'You may pass this lady,' he said loftily, and that sufficed.

'So sweet of you, Senator!' said Aunt Gracie. 'I never knew such a world for kindness—never!'

'One makes one's own world, dear lady, as no one knows better than your wise self, I suspect,' responded the Senator, with much respect and cordiality. 'The "Bristol," is it not?'

'Yes, Senator; and if a cup of tea will tempt you this afternoon—'

'Count on me, Miss Ridley. I'll be there,' said he.

A few other hands had to be shaken, and then they were in the car.

'Just imagine, Lawrie,' said Aunt Gracie in the intermediate moments, 'these dear, good people making such a fuss of an old guy like me (in a borrowed hat, too) only because I'm steeled against all the changes and chances of this precious mortal life of ours, and take things as they come! Lawrie boy, there's nothing like pluck—as some call it—nothing!'

Lawrie gulped and bided his time.

It soon came. Ere the car had hooted over a furlong of roadway Aunt Gracie put her hand on his and said, 'Tell me what it is, dear. There's something wrong, I can see. What is it?'

He told her with extraordinary ease. She didn't wince even at his preamble: 'I'm an awful scoundrel, old dear; not fit to manure a field'—

'Go on, Lawrie boy!' she said, clipping his hand tight, with a smile a saint might have envied her.

He began with the stocks and shares, and

they were near the hotel when he reached the cheese-and-diamond stage.

She had commented hitherto only with gentle 'Ahs' and 'Ohs' and pressures of his hand; but the diamonds were too much for her. 'Lawrie *darling*,' she burst forth, 'how gorgeous! I see it all. You need scarcely tell me *any* more. Of course you couldn't have kept it up, poor boy! You'd changed your mind and meant to go home to face the music, hadn't you?' He nodded. 'Yes, yes, I knew it. But what a delicious story it is—about Mr Kramm! You must let me have it, dear. I can work it into a couple of thousand pounds by Christmas. There's the Chaga-country book to do first; but I'll rush that in six weeks. This afterwards, Lawrie, if you'll let me; and— But here we are!' She whispered rapidly before they alighted, 'You see what I mean, dear, don't you? We'll go home together in a day or two and put things quite straight at the office. How thankful I am that I *knew* I wasn't meant to sink! It was just feeling so positive about it that kept me afloat. But I've got to tell you about that!'

There was much traffic with newspaper reporters that afternoon and evening at the 'Bristol.' 'Miss Ridley the traveller,' already an appreciated character in New York, was a first-class scoop. She welcomed this increase of her fame, and gave the press gentlemen nearly as much copy as they craved from her. And between four o'clock and half-past five Senator Huggan's own stately tongue helped her and them in the matter with great good humour. 'You cannot be too lavish in your generosity to the public, dear lady, if you desire them to be generous to you,' he said; and she agreed.

By then Lawrie was almost happy again.

Two hours' shopping and telephone talk with the headquarters of the Prophet Line settled the deficiencies of their respective wardrobes. And a telegram had gone to Trevor in Durnham to assure him that although Lawrie was in New York with Miss Ridley, wind and weather permitting, he would be at the office on Monday the 2nd July as arranged.

Aunt Gracie was an undiluted blessing to him throughout the day. Such a gay blessing, moreover, with no foolish remorse on his behalf about his sideslip, as she termed it. 'We've recovered our balance in time, and that's the only point we need remember, Lawrie boy—except our beautiful story about Kramm the Diamond Smuggler.'

The Durnham trouble and its rectification she took entirely on her own brave shoulders; the Kramm book that was to come would be more than enough for that.

The busy and blessed day ended for them about midnight, with a cocktail apiece in a cosy

corner of the hotel—the cocktail a special West African creation of which Aunt Gracie had made a note. She said they both deserved such a treat, and tossed hers down after a remarkable wink, and the words, 'To you, dear, now and evermore!'

Lawrie's response, 'To the best aunt that ever breathed!' had a quaver of emotion in it; and as if to give this no growing-room, she promptly smacked her lips like the commonest of the common, and exclaimed, 'Lawrie, what wouldn't I have given for one of these when I'd been in the water ten minutes? But we've had enough of my rescue from a watery grave by this time. I'll tell you something fresh. We are such funny animals! Do you know what I was most glad about just before that Newfoundland fisherman drifted out of the fog as nearly as possible on top of me, and I shouted 'Ship ahoy there, help!' with all the lung music I'd got left?'

Lawrie shook his head.

'You'd *never* guess, my dear,' said Aunt Grace, hunching her shoulders mirthfully. 'I'm afraid I didn't give Paradise a thought from first to last, but I was so *glad* I'd added another thousand to my life assurance policy last year

—for you, Lawrie. *Aren't* we creatures? But come along, to bed with you.'

Lawrie had thoughts that night like prayers, chiefly, of course, about this best aunt that ever breathed, but also about those Newfoundland fishermen and the skipper of the Waterfall liner *Lodore* who had consented to slow down for a mere fisherman's hail, and give a derelict lady a lift to New York. Also, he made vows about himself which were better than prayers.

And the vows were stronger in him than ever when, precisely on the Monday of his prescribed return to business, he left Aunt Gracie to chat with the Rutlington Junction stationmaster while he went to the cloakroom.

'There'll be something to pay, sir,' said the man in charge, after due scrutiny of his luggage-receipt in the name of Simpson. 'They've been here several days.'

'Yes,' said Lawrie; 'I'll pay whatever you please, gladly.'

It was an indiscreet avowal for any man, much more for a lawyer. But that was what he felt like, through and through, the Beedham half of him as well as the Ridley half.

THE END.

THE EDUCATION OF TRAVEL

Is it a great way to go to school, and a great fee to pay for it?—JAMES RUSSELL LOWELL.

DEAN KITCHIN once remarked what fine breadth of intelligence, evident in all his work, had entered into the soul of John Ruskin from his travels. Our present King has shown in all he has said and done the enlightening influence of world-wide travel. In these days of going to and fro upon the earth, knowledge has certainly increased. The increase of wisdom in every case is not so certain. To bring home knowledge a man must carry much away with him; the eye sees what it brings the power of seeing. James Hannay, writing about the snob abroad, asked who ever saw him learning anything, and pointed to his ignorance as one of the causes of his insolence and contempt for what he does not understand. Home-keeping youths have ever homely wits. Lord Bacon wrote in an age when travel was part of a liberal education as much as grammar or philosophy, and said that travel in the younger sort is a part of education, in the elder a part of experience. James Howell, who wrote *Instructions for Foreign Travel*, left an amusing series of letters descriptive of his Continental wanderings. John Milton travelled with a man-servant for fifteen months in Italy; while Joseph Addison made good use of the pension of three hundred pounds a year which he received from Government for purposes of travel and general preparation in public affairs.

Other famous travellers will occur to the reader, such as Roger Ascham, Coryate, and William Lithgow, who travelled for their own and other people's edification.

Robert Shortreed, the companion of Sir Walter Scott in some of his Border pilgrimages, hit on a truth in regard to him, as well as in regard to every man of individuality and genius. 'He was making himself a' the time, but he didna ken maybe what he was about till years had passed; at first he thought o' little, I dare say, but the queerness and the fun.' Would George Borrow have developed his literary powers as he did had he not turned his back on London and become a wanderer, first in gipsy fashion, and then as agent of the British and Foreign Bible Society? R. L. Stevenson, another wayward wanderer, chiefly in search of health, wrote paradoxically:

For who would gravely set his face
To go to this or t'other place?
There's nothing under heaven so blue
That's fairly worth the travelling to.

Too often the modern craze for travel is an expression of restlessness; the soul cries, 'Were I there and not here it would be well with me.' It is not of or for such restless and aimless individuals we write.

The effects of study and European travel are written broadly over the writings of such well-known Americans as Washington Irving,

George Ticknor, Longfellow, Bayard Taylor, Hawthorne, Mark Twain, and W. D. Howells. A few in this list made their reputation from work suggested by what they saw and felt in Europe. Irving's *Sketch Book* embalms the England of a hundred years ago, and has still the dew of morning upon it. Mark Twain made a great reputation by his *Innocents Abroad*, *New Pilgrim's Progress*, and *Tramp Abroad*. We have heard a clergyman say on his return from Palestine that Mark Twain's impressions of that country, in the *New Pilgrim's Progress*, were the truest and most graphic ever penned. Probably they are also the least reverent. By study and travel in Europe Longfellow laid the foundation of the learning necessary for the Smith Professorship of Modern Languages at Harvard. Of an Italian journey he said, 'The joy is written in my memory with a sunbeam.' His sketch-books of scenes and stories of France, Spain, Germany, and Italy are not so well-known as Irving's; but they have many good qualities of their own. And Longfellow, whose works have still a larger sale than those of any modern poet, thus gained ideas and the groundwork for much of his best verse. He traversed France from Normandy to Navarre, smoked his pipe in a Flemish inn, floated through Holland in a *trekschuit*, trimmed his midnight lamp in a German university, wandered amidst the classic scenes of Italy, and listened to the gay guitar and castanet on the banks of the Guadalquivir. The *Views Afoot* of Bayard Taylor (1846) was a record of two years of pedestrian travel, 'while I was educating myself in a most earnest but desultory way, without the guidance or even contact of minds which could have properly assisted me.' He made a reputation by his travel-book whilst educating himself more completely and variously than he could have done at home. James Russell Lowell, commenting on the results of his first European journey, asks, 'Is it a great way to go to school, and a great fee to pay for it?' It was to know things, rather than to know men, that he travelled, because he felt that there was a microcosm of the great world of human beings in every small community. In his *Fireside Travels* he asserts there are two epochs at which a man might travel—before twenty for pure enjoyment, and after thirty for instruction. At the first age the eye is sufficiently delighted with merely seeing; after the second, the man can benefit more by study and reflection. In arranging his baggage does the traveller ever ask himself how small a portmanteau will contain all his mental and spiritual outfit? Was Mark Twain in jest or earnest when he said that the gentle reader would never know what a consummate ass he could become until he went abroad? Vivid and full of colour and humour are his own writings, presenting 'a new gospel in travel literature, the gospel of seeing with an overflowing honesty.'

Few members of the great American annual invasion are any but shallow travellers, as compared with these distinguished examples. One lady, who has seen many parts of England, France, and Belgium, comfortably and pleasantly, for an expenditure of about sixty pounds, wrote a book on *How to See Europe on Next to Nothing*. Fetridge, in his *Handbook for Travellers in Europe* (Americans), wishes 'strongly to impress upon the minds of our countrymen who are making the tour of Europe by no means to miss Scotland. If your time and means will not allow of it, miss Italy, miss Switzerland, miss Germany, the Rhine (how tame compared with the Caledonian Canal route!), miss any of these, but do not miss making the tour to Inverness.' It is marvellous, when we think of it, the attraction of the Old Country to the travelled American.

It is a feature of to-day that there are American schools for boys and girls which give an important place to the education of travel. Excursions are also made by some English and German schools to places of interest. Mr Porter E. Sargent, of Cambridge, U.S.A., conducts a 'Travel School for Boys,' about which a grateful parent writes: 'From an educational standpoint I think absolutely nothing can compare with the opportunities afforded by travel under the conditions that these boys enjoyed with you and Mrs Sargent.' It is his custom to make world and European tours in alternate years, and this year (1912-13) will be spent in Europe, the party having sailed from New York last October. The great advantage of this European travel-study plan for boys, he considers, lies in the fact that secondary school studies are so largely European in their nature. Naturally, therefore, the interest in them can be greatly enhanced when they are pursued in European surroundings. The advantage of studying French and German in their native countries is obvious, and we all know how history becomes a matter of immediate interest in the presence of historic scenes. About half of the boys are usually preparing for college, and pursue the necessary subjects with individual instruction, concentrating upon that study which is of the greatest immediate interest. For those who are preparing for business a course in commercial subjects is given. The entire cost of the school year of eight months is about three hundred and seventy pounds. This includes care, tuition, maintenance, and all travelling expenses from the time of sailing until the return to the United States. The boy's possible allowance of twenty-five dollars a month is under control of the director, to be advanced weekly or monthly. School-work begins on the same day that the steamer leaves New York. Short excursions are made where the steamer stops at the Madeiras, Gibraltar, Algiers, and Genoa. A few days are given to excursions in and

around Naples, to Pompeii, Pozzuoli, or Capri. Time is also spent at Sorrento, Amalfi, and Ravello, permitting morning school-work. In Rome there is opportunity after school-work for sight-seeing, for visiting monuments, churches, ruins, and museums. The tour is continued by Florence, Bologna, and Venice, through Austria to Germany, where Munich and Nuremberg are visited. Next come tours in Holland, Belgium, and France; with motor journeys through the château district and Normandy. Mr Sargent says on crossing to London that it is 'a world in itself, the epitome of Anglo-Saxon civilisation. Its museums and galleries, filled with the great treasures of the world's art, will interest us, as well as the best things at the theatres.' There is some touring and motoring in Devon and Cornwall, and Chester is also visited before departure at Liverpool; but surely it is a mistake to say that this last town still has its Roman walls. These have to be dug for below the street-level.

Miss Moxley's school of study and travel for American girls is situated on the Pincian Hill, the highest and the most beautiful and healthful part of Rome. It affords a home, with opportunities for study and travel. Music, art, languages, as well as the history of Rome and her monuments, the operas, museums, excavations, and art collections, all receive due attention. The school year is from October to June, and the fees are three hundred pounds, including the ocean passage from New York back to New York. During the midwinter vacation in February excursions are arranged to south Italy and Sicily, Greece, Spain, or the Riviera, and a tour of central and north Italy is made in May. The pupils are previously prepared for these excursions by their school-work in history and art, and in the various talks and readings.

Travel classes for American girls at Paris, Munich, and Florence are conducted by Mrs Edith Cooper Hartman, who says that 'travel becomes not the mere sight-seeing round of the courier-driven tourist, but a revelation of humanity in its great phases of evolution and history-building, which develops in the young mind tolerance without sentimentality, knowledge

without pedantry, and taste without affectation.' She holds that seeing for one's self at first hand is much more vivid and stimulating than hearing about the same thing in the schoolroom. So from October to June a small party of young ladies over eighteen years of age have the privilege of conducted study and travel in Paris, Munich, Nuremberg, Florence, Rome, and Naples. The itinerary includes prolonged residence in three of the greatest centres of art and culture, with considerable general travel. Mornings are devoted to class-work, music, and language lessons, as well as talks and preparation for sight-seeing. The Thompson-Baldasseroni school of travel is on similar lines, with its opening tour in England, France, Switzerland, and Italy; and the closing tour includes Venice, Austria, Germany, Belgium, and Holland.

Under the will of Cecil Rhodes a number of colonial, American, and German scholarships were established in order to instil into the minds of young colonists the advantage to the Colonies as well as to the United Kingdom of the retention of unity of empire, and to further the good understanding between Britain and the United States. Seventy-eight colonial scholarships of three hundred pounds a year are tenable at any college in the University of Oxford for three consecutive years. There are travelling scholarships at Oxford, Cambridge, Glasgow, and Edinburgh Universities. Two fellowships at the last-named enable graduates 'to issue from the world of books and their narrow sphere of habitual interests into the broader world of various civilisations.' In the regulations for other scholarships, travel or study in foreign countries is suggested and encouraged. The Oxford students for the Indian Forestry Service must spend, out of a curriculum of two years, eight months of their holidays in getting into close touch with the forest services in France, Switzerland, and Germany. Thus a thoroughly practical training is secured in forestry, as well as a broadening of the students' knowledge of peoples and places. So the twentieth century has its own methods of carrying on the travel cult of the sixteenth century, which was infinitely slower, narrower in range, and limited to the wealthy student and traveller.

THE DOOR OF RELEASE.

By CHARLES D. LESLIE.

THE General got to his feet shakily. Of late an increasing stiffness in his limbs warned him that the limited activity eighty-five years permitted was lessening. He marched to the door, mutely and irritably refusing the arm Henderson officiously offered. On the table lay the flowers, a big bunch of red and white roses, the best money could buy. He sniffed them appreciatively and fingered the white silk

streamer with red lettering attached to the stems.

'Read it to me,' he commanded; and the servant read, 'And ever upon the topmost roof the banner of England flew.'

'Ay, ay,' said the General complacently, 'it's true. Mrs Frowde and I both know it.'

'Yes, sir,' agreed Henderson. 'Shall I carry 'em downstairs?'

'Yes; but be careful of them,' the General admonished.

A raw October day met him when he issued forth, but he was well muffled and heeded it not. Self-absorbed, he stepped into the waiting taxi; and Henderson, laying the flowers on the front-seat, shut him in. In his heart the General preferred a four-wheeler, but he prided himself on moving with the times, and always insisted on the swifter vehicle. But to-day there was no need to fight his secret nervousness—the cab went too slowly for his liking; and, though the distance between Jermyn Street and Berkeley Square was short, he was fuming with impatience ere the driver pulled up.

Lady Burrell's butler was on the lookout, and the visitor had hardly descended, clutching his flowers, ere the man was beside him, relieving him of his charge. 'Her ladyship is out, sir, at present; but I'm expecting her back every moment. I'll tell Nurse Palmer you're here.'

'How is Mrs Frowde?'

'About the same, sir, I believe.'

The nurse came to him in the downstairs drawing-room, a tall, good-looking woman, with the placid face and capable air that mark the model sickroom attendant; but her welcoming smile lacked its usual warmth. 'I don't think I can let you see my patient to-day, General,' she said at once.

'What! not see Mrs Frowde to-day! On her birthday! Nonsense! Why, I've not missed it since— She'll be hurt not to see me.'

'Her memory is failing. I don't think she'll know you.'

'Not know *me*? Pooh! Nonsense!'

'She's getting a little childish,' said the nurse gently; 'but I'll take her these lovely flowers. I'm sure she'll enjoy them.'

'Childish!' echoed the General. 'I don't believe it. Mrs Frowde childish! Gad, young lady, if you'd been in the Lucknow Residency fifty-four years ago—only of course you weren't born—and seen her nursing the wounded, sustaining the last hours of the dying, entertaining and cheering us men in our scanty hours of release from the trenches, never despairing, always bright and smiling and hopeful! The Florence Nightingale of the siege childish!'

'She's fifty-four years older,' said the nurse, with a deprecating smile. 'However, General, if you insist'—

'I insist on seeing my old friend on her birthday, and offering her my congratulations and homage.'

They went—the hale young woman and the frail old man—upstairs into the sickroom. It was a spacious, well-lighted apartment; all the resources of modern science had been called in to soften the inevitable passing of the old woman whose useful life had ended long ago. Wrapped in a purple robe, she lay in an invalid-chair near the fire staring at the flames with a

face utterly void of expression. While her body obstinately lingered on earth her mobile mind came and went, her senses were blurred and almost dead; she had outlived everything but life itself.

The nurse, stooping, said loudly in her ear, 'Here's the General come to see you, Mrs Frowde.'

'Fanny!' said the visitor, advancing.

The voice struck a chord of memory, and for a moment the wrinkled countenance became animated; perhaps she recalled the days when she had listened for it during the eighty-seven days of the first siege, that siege with only three days without a casualty list. 'Sam!' she whispered.

He took her hand and kissed it reverently.

The tragedy of his life was in that salute. Her husband had been his brother-officer and friend, and to that friendship, though he loved Fanny, his loyalty had been lifelong. A time there had been when the temptation to try to win her from Frowde had come to him, but a certain memory stayed him—a memory of the siege. In its early days, when the story of Cawnpore had filtered in—that blackest page in the book of Britain's history—Frowde, in his wife's presence, had asked his comrade and best friend, if he survived the speaker, to kill Fanny with his own hand when the Residency fell, for fall they then feared it must. Fanny had religious scruples as to taking her own life, but infinitely preferred to die by the hand of her husband or of his comrade rather than fall into the power of the rebels. She told them so, a hand in each of theirs, her dark, tired eyes shining sombrely in her white, drawn face. For her at that moment the bitterness of death was past; little Jack, her first-born, had died in her arms the night before—died for lack of the food his wealthy parents could not provide.

It was Frowde who had stood between the young officer and happiness—Fanny was Frowde's wife. Yet in after years he sometimes smiled to remember how he watched over Captain Frowde, how the fear of having to keep his sworn word had haunted him waking and sleeping like a nightmare, and how he prayed that Jack would outlive him. He would manoeuvre to keep his friend out of the 'forlorn hopes.' Himself he would embrace them. No man, save Kelly the mad Irishman, as he was called, risked his life so eagerly and recklessly, or left the lines so frequently on counter-assaults on the houses from which the sepoys fired upon the garrison, as Captain Frowde's comrade. He and Kelly and a faithful native, Kelly's shadow, used to steal out at dawn with a bag of gunpowder, approach the house whence the firing particularly annoyed the besieged, blow up the door with the powder, rush in, and put the rebels to death by the sword. Incredible to relate—but the true story of the siege of Lucknow is more incredible than any fictitious tale—they did this again and again, and came back alive, red to

the elbows with alien blood. Later, Kelly fell fighting under Havelock.

But 'Ever upon the topmost roof the banner of England flew,' and the skirl of the bagpipes—ah, memorable day!—'Outram and Havelock breaking their way through the fell mutineers,' lifted the grim shadow of that promise. Fanny lived; the General lived; Frowde lived. It was thirty years later when the parting came, and Colonel Frowde, full of years, died of pneumonia peaceably in his bed.

'It's your birthday, Fanny, you know,' the General said. 'I've come to see you, and I've brought you a few flowers. There aren't many of your birthdays I've missed since '57, eh?'

But Mrs Frowde answered not; her eyes had again turned to the fire; her mind was voyaging in unknown seas. She was past hearing, past caring. How much had she cared for the faithful friend now standing beside her? But that is a secret into which we must not pry.

Nurse Palmer, vainly endeavouring to create a diversion, offered her the flowers; but the invalid crossly pushed them away. The General's face grew gray.

At that moment Lady Burrell came in. 'My dear General, forgive me for not being in when you arrived,' she said; 'I was delayed.' Also, the visitor was early. 'Tea is coming up. I'm afraid this isn't one of mamma's good days. But I'm here, you know;' and she smiled into his face.—'And I was in the siege. I remember his carrying me in his arms,' she explained to the nurse.

She was sixty, a little woman who had never been pretty—at least not since the siege. The General could remember her as a fat, chubby infant of three when it began, and she came out of it, like the few others who survived, a wizened, prematurely aged little scarecrow. But she lived, though Jack and Frank died.

The butler brought in tea, and the General took a cup from Lady Burrell's hand, and tried hard to be cheerful. But it was a mockery of the usual festival; the knowledge that Mrs Frowde was too old and ill to take any interest in the great day—she who only a year ago had enjoyed it as much as he, and talked reminiscently of the first birthday party in the Residency—lay like a cloud over it.

The nurse tactfully begged to hear from the General's lips the story of the first of these gatherings fifty-four years ago, and the old man, with a flash of interest, plunged into the recital.

There were eight of them that day—'not counting you, my dear; you were too small to count'; this to Lady Burrell—Captain Frowde and himself, two civilians, three ladies, besides the giver of the tea-party. A precious ounce of tea had been hoarded for the occasion, and there were slices of ham, and flat cakes baked by one of the native servants. But the crowning joy of

the feast was due to the General. By means he declined to particularise, he had secured and brought them a packet containing a handful of sugar—sugar was almost as precious as pure gold at that time—and in their sweetened tea they toasted their hostess, who in reply invited them to tea on her next birthday and every succeeding one as long as she lived.

The General had missed few of these birthdays since—five when he held the Canadian appointment, one when he was at Gibraltar, and one when Mrs Frowde lay seriously ill with influenza. That was about all; but Penny and Brandon and Mrs Thwaite did not come the next year—death had claimed them; Miss Hope had been dead many years, and Mrs Luttrell at least ten.

Gradually, as they grew older, the birthday-tea, in the eyes of the two survivors, assumed an ever-growing importance. The General would not have missed it for a king's ransom, and Mrs Frowde took extra care of herself for fear she should catch cold and not be at her best and brightest on the great day. Tenderly, among other relics of Lucknow, she treasured the ribbons of the bunch of flowers the General never failed to bring; there was quite a pile of them now. The two old folk and Lady Burrell, whom they still unconsciously regarded as a child, would drink tea together, and the past would rise up: the flies, the vile odour of dead cattle they could not evade, the heat, the overcrowding, the scanty food, the ever-brooding expectation of death, and the loss of friends who one by one, by bullet or pestilence, had left the survivors to fight on. Time had softened the recollection of the horrors. As they looked backward, how incredible that they should have survived! The memory of it was like a bad dream, and yet something to be proud of; they, the old man and the old woman, had each in their own way fought for Britain, and their names were linked together with the imperishable record of the siege.

But soon the General's voice faltered; the story of the brave days of old did not come readily to his tongue. Lady Burrell had to take it up and talk, while his eyes wistfully strayed again and again to Fanny, blind to his presence, deaf to the tale, dumb when the siege was the topic of conversation. Tears gathered to his eyes.

Presently the nurse rose and tried to get the invalid to drink some beef-tea. The old woman repulsed her, striking at her in senile rage. She was childish! With a stab at the heart the General recognised the fact. It was more than he could bear, and he rose to go.

He looked so frail and old standing in the hall that Lady Burrell said she would accompany him home, and was about to bid a taxi be called, but he stopped her.

'I'm going to walk home, and I prefer to be alone,' he said.

Against her will, Lady Burrell let him go. The world called her domineering, and her

husband, who liked a quiet life, gave in to her ; but she never withstood the General. There are some impressions that never die, and that of the big, kindly soldier who carried her in his arms at the siege of Lucknow lingered. His wish was law. But when the door closed behind him she said softly, 'Poor old man! Poor, lonely old man!'

The General marched off with a fine assumption of health and activity. But inwardly he was a stricken man. Away from the house the full measure of the calamity that had befallen him returned with redoubled force. There would be no more visits to Mrs Frowde, no more teas on her birthday to look forward to. His old friend might live a while, but would never be the same again. Henceforth there would be a big, hideous blank in his life. He would be very lonely; he would feel ever more acutely the disabilities of age creeping upon him. Perhaps in two years, if he lived, he would be like Mrs Frowde, helpless as an infant, dependent upon others. He prayed that might not happen, that death would open the door of release. It came to him in a sudden flash of knowledge that they, Mrs Frowde and himself, had lived too long. Their contemporaries were dead, and they had in a sense outlived their faculties. What was left of the self-sacrificing nurse and wife and mother, and the gallant soldier, who were besieged in the Residency fifty-four years ago? An old woman in her dotage, and a frail old man who would soon be too weak to dress himself without assistance!

By this time he had come to Piccadilly. Across the way the 'Ritz' reared its solid bulk into the murk of an October evening; before his eyes ran the gleaming lights of the passing vehicles. He stopped and looked at them with unseeing eyes; his mind was back in Lucknow Residency in siege-time, in the days when he was young and hale, and the leader of counter-assaults. As in a reverie, he suddenly saw Kelly standing beside him, plucking at his sleeve and pointing, and, lo! it was gray dawn, and they were outside the lines and under the shadow of the houses whence the rebels fired upon them. Kelly's eyes gleamed; his extended hand indicated a door, the shut door that guarded the marksmen who harried and decimated them. Surely it was from this house that the shot came that killed Lieutenant Clarke the day before? Bang! A loud report. Ah, Kelly had fired the train, and the shattered door fell slowly! He saw that the way lay open, and, sword in hand, he sprang forward shouting, 'Follow me, lads! Follow me!'

The traffic eastward was stayed, for the motor-bus pulled up in the middle of the road, and a small crowd, including a policeman, had gathered in front of it round the prone figure. The driver, his honest face white under his cap, leaned over the wheel.

'As Gawd's my judge, it weren't my fault. He jumped right into the road hallooin' like a madman.'

'That's truth ye're sayin', mate,' a weedy-looking loafer chimed in. 'I see'd 'im, an' I'll swear to it. 'E fair committed soocicide. I 'eard a motor back-fire, go off like a cannon, an' turned an' saw 'im. 'E chucked 'isself in front o' yer. Silly ole jossler!'

'Here, none o' that,' said the policeman sharply, as he straightened himself and took command of the situation. 'He's an officer, or I'm mistook. Don't you speak like that o' him.' The pride of an ex-army man was in his voice. He looked at the luckless driver. 'Let's have your name and address.'

Some one, muttering 'I'm a doctor,' had knelt beside the fallen soldier. He now stood up, saying briefly, 'Dead from shock. He was a very old man.'

A tall, well-dressed gentleman overlooking the scene from the pavement pushed his way forward, glanced down, and cried out, 'It's the General!'

'You know him, sir?' respectfully asked the policeman.

'Yes, I knew him well; he was my father's old friend and brother-officer, a most distinguished soldier.' Then, addressing the driver, he said, 'You've killed one of the heroes of the Indian Mutiny with your cursed Car of Juggernaut; a man who won the V.C. in India over fifty years ago, and went through the siege of Lucknow.'

'It weren't my fault,' sullenly repeated the driver. 'Gawd knows it weren't my fault.'

The ambulance came, and they lifted the inanimate figure upon it. The face was very peaceful; he seemed to be asleep. It was the face of a soldier resting after victory. They laid him in his narrow bed, and Henderson placed his various medals and decorations on his breast. Lady Burrell came later, and, with blurred eyes, put into the folded hands a bunch of red and white roses. Attached to the stems was a long white ribbon, whereon was written in red letters: '*And ever upon the topmost roof the banner of England flew.*'

A SPRINGTIME SONNET.

I SAW spring lately in a foreign land
Far overseas, when autumn here was queen;
She scattered wondrous largess from her hand—
White arum lilies starred the tropic scene,
Hedges of heliotrope were decked between
With roses which the scented breezes fanned,
And golden wattle blazed as if to screen
My radiant garden from the mountains grand.

But now I watch with gladdened, wondering eyes
This timid wakening of wild English flowers;
A hundredfold more dearly do I prize
The tinted buds of the anemone
And primrose pale in this homeland of ours
Than all that alien pomp and pageantry.

Chambers's Journal

SEVENTH SERIES

THE QUESTION OF ANONYMITY AND PSEUDONYMITY. SHOULD AUTHORS DENY THE AUTHORSHIP OF THEIR OWN WORK?

By COULSON KERNAHAN.

IS it a breach of faith for an author who has published a book anonymously or under a pseudonym, flatly and explicitly to deny that it is his work? If the book be in a literary sense a child born out of wedlock, the parentage of which the author is ashamed to acknowledge, or if he have used the cloak of anonymity or pseudonymity to strike a cowardly blow, or to say under the safety of that cloak what he has not the courage to say over his own name, no excuse can be accepted for pseudonymity or anonymity. Caution may be justified, but cowardice never. With these exceptions, all will agree that an author has every right to publish his book anonymously or pseudonymously; and all will agree, too, that in refusing to answer questions and in bidding the inquirer to mind his own business, an author is equally within his rights. If the matter ended there all would be well for him and his secret; but unfortunately a refusal to speak is sometimes interpreted as tantamount to an admission of authorship, for if the author have no connection with the book he would surely feel free (so it has been argued) openly to say so. Directly challenged with the authorship of a book, more than one writer of eminence, finding themselves cornered, have not hesitated—apparently with no qualm of conscience or scruple in regard to honour—to fall back upon a denial.

That there is precedent, even great precedent, for such denial I am aware; but precedent in itself cannot establish a principle. It means no more than that the thing has been done before; and since there is apparently no law, written or unwritten, upon the subject, and since, moreover, it raises a curious question in literary ethics, some consideration of the pros and cons may not be untimely.

First let us look at the matter from the author's standpoint. 'No one has a right,' he might justly argue, 'to force my hand and to wring from me a secret which I wish to preserve. I am not called upon by any law of God or man, of honour or of ethics, to publish my business to the world; but since only by a falsehood can my just rights be secured, the falsehood lies not upon my conscience, but upon the conscience of the person who compelled it.'

Having thus, as he would contend, made good his case against those who hold that falsehood is

in any circumstances dishonourable, he might conceivably go farther and contend that legally as well as morally a falsehood was justified. 'The law,' he might say, 'does not permit an act of personal violence against another. But if a man attack me for the purpose either of injuring me or of robbing me of my property, and I use violence in return, I am held by the law to be justified in so doing, inasmuch as the violence is used in self-defence. The secret of the authorship of this book is my secret and my property, and my own property I am surely entitled to defend. Assume that a burglar, holding a pistol to my head, demand to know whether I have cash or valuables in the house, and, if so, where they are to be found. In such circumstances, under such compulsion, the most scrupulously honourable of men would hardly hesitate to lie if by a lie he could balk the burglar of his nefarious purpose; and I am abundantly justified in lying to the literary burglar who demands to be acquainted with the secret of my literary safe.'

There are several reasons why one might wish to issue a book anonymously or pseudonymously. If the writer be a beginner, and so have absolutely no literary reputation, the publication of his unknown name advertises that fact alike to the critics, the bookseller, and the public. That the book is published anonymously is, of course, no guarantee of merit; but there is at least the possibility that it may be the work of some one of standing who for social or personal reasons, or perhaps because he is attempting a new departure, is anxious to remain incognito. If the book make anything of a mark, curiosity, speculation, and discussion in regard to the authorship are inevitable; and curiosity, discussion, and speculation spell sales. As the motto of many who write is, 'What shall it profit an author if he gain the whole world and lose his own sales?' or 'What shall an author give in return for his sales?' the advantages of anonymity are evident.

To illustrate this I may perhaps be pardoned for relating my own experiences in the matter of an anonymously published volume, not because what happened or did not happen to any little book of my own can be of the remotest interest to any one except myself, but because—since fish head up-stream—a stickleback may serve to

[All Rights Reserved.]

MARCH 22, 1913.

indicate the swing of the current no less than a ten-pound trout, and because we are on surer ground when at grips with actual facts and when speaking from a personal experience than when merely generalising. My own first book (I refrain from advertising it by name) was published anonymously. It was, I hope, no worse, and I am sure no better, than the majority of initial efforts; and had it borne my then entirely unknown name it would in all probability have met the common fate of such work. But one reviewer ascribed it to the late Harold Frederic, the last man in the world to have been guilty of such a book. Soon after this I was introduced to Frederic by a friend who was in the secret of the authorship, and I remember that my introducer—it is always one's friends who do such things—maliciously turned the conversation upon my book, and asked Frederic whether he had read it and knew that the book had been attributed to him. Frederic, it seemed, had read the book, and did not hesitate to express in the plainest and most unmistakable Saxon an opinion which was by no means flattering. I remember how he hooted with wild derision at the bare idea that he had written it, and how he swore great oaths as remarkable for size as for the scale of their profanity. Then, jerking a thumb towards me, my introducer said quietly, 'This is the author.' 'The devil it is!' roared Frederic.

I hastened to assure him that there at least he was mistaken, though he was probably quite right in the estimate he had formed of my book; and, seeing that I took all he had said in good part and enjoyed the joke, he swore that I was at least something of a sportsman, if nothing of an author, and we became and remained good friends to his life's end.

The book had also the extraordinary luck to be attributed to no less brilliant and distinguished a writer than Sir A. T. Quiller Couch ('Q.', as he was then known); but in that case the confusion was due to some similarity between the title of my book and one of 'Q.'s' early works.

Another sufferer was the late Robert Buchanan, by whom more than one reviewer declared my book to be. How he took the blow, if he ever heard the association of his name with my anonymous work, I do not know, for though I met him occasionally, I wisely refrained from rousing his titanic wrath by any allusion to the subject; and when he died I made what tardy reparation I could by proposing that a monument be erected by public subscription to his memory and placed over his grave in the cemetery of Southend Parish Church, and by carrying the project through to a successful termination in collaboration with my friend and co-honorary secretary, the Rev. Thomas Varney, then curate of Southend.

The book still sells, and was recently included—hear it, ye gods!—in 'The World's Great Books;' but I say in no spirit of mock modesty that I believe the success it attained was due

less to any merit of its own than to the curiosity which was aroused by its anonymity, and to its extraordinary good-luck in being attributed to Frederic, Buchanan, and 'Q.'

My own reason for anonymity I have stated. But there are other reasons why an author may not wish to put his name to his book. He may, for instance, feel that what he has to say on any given question will be more impartially considered, and will be more likely to effect its purpose, if issued anonymously, and so impersonally, than if under a name the bearer of which, by reason of his position, occupation, or spoken and written words, may be supposed to incline to any particular school of thought, political party, or religious belief.

When I was chief editor to a great publishing firm, a very famous divine once brought me the manuscript of a highly imaginative and religious book of his writing, and asked my advice about it. 'Publish it anonymously,' I said. 'You are known to be a "reverend," and if it is issued under your name there will not be wanting readers who will say, "Oh, he's a parson, and of course he'll preach. It's his business, and he's paid for it." Issued as by a layman, and good literature, as it undoubtedly is, no less than sound religion, it is more likely to attract what I may call "all-round attention" than if published under your own name. You may lose the particular section of the reading public which is on the lookout for books by divines and preachers, and you will lose your immediate followers and readers among your own congregation; but the book is strong enough to stand by itself merely as literature, and I think you would do well to take your chance.' He did so, and I proved to be right, for the book ran into many editions as an anonymous work, and when it was finally issued with the reverend author's name on the title-page, it had a new lease of life among the members of his large congregation and the many admirers of his sermons and religious books.

Another reason for publishing a book anonymously or pseudonymously is that if the author be attempting a new departure in subject or in method, he may hope to obtain a more unbiassed verdict. Grant Allen once told me that he could predict with absolute certainty what certain critics would say when reviewing a book that bore his name. It was not that he objected to what they said, but that they always said the same thing. They knew, or thought they knew, his merits, his methods, and his limitations, and looking for these merits, methods, and limitations, they always found them. It was only, he said, when he wrote under another name that they discovered new possibilities in his work.

Or take the humorist. If a writer be one of the fortunate few whose books sell by virtue of their humour, his wife and children may 'walk in silk attire and siller ha'e to spare,' and himself may be in a position to indulge his sense of

humour by killing time and possibly an occasional fellow-creature by means of a motor-car. I am not sure that were he so to alay a fellow-creature his public would not laugh heartily at the homicide, and regard it as a new and original way of being 'killingly funny.' But let that humorist seek under his own name to make a new reputation as a serious writer, and his public will refuse to take him seriously. 'I verily believe,' complained a well-known humorist to me, 'that if I came into a room and remarked that my nearest relative was dead, or upon a platform and said that I was about to undergo a serious operation, my audience would explode with laughter, and vow to a man that I should be the death of them.'

Lastly, we come to the authors who think that they best serve 'Art' by issuing certain of their books anonymously.

Take, for instance, the case of the late William Sharp. I have heard the sincerity of his devotion to Art called in question. 'It was not for Art's sake, but for William Sharp's sake,' said a certain critic to me once, 'that he started a second firm to do business under another name. He had been writing as William Sharp for a long time, and the novelty and the interest that attach to a new name with new possibilities and a new note were gone. Once the reviewers imagine—no matter how mistakenly—that they have taken the measure of a man, he does not easily win recognition anew. Sharp felt that as William Sharp he had gone as far as he could go, and that under that name there was small hope of advancing his reputation and of turning to account gifts that were greater than either the public or his reviewers were aware. It was for that reason he started a new and branch business under another name. It is easier successfully to start an entirely new journal than to pull up the circulation of, and to put new life into, an existing journal the progress of which is rather slow. The public is interested in novelties, and Fiona Macleod, the mysterious Lady of the Highlands—who, unlike "little children" who are told that they "should be seen and not heard," was "heard and not seen"—offered unprecedented opportunities for advertising anew the excellent but insufficiently advertised and inadequately appreciated wares of the old firm of William Sharp. As a business move it was perfectly legitimate, and as a business move it no doubt succeeded; but when you speak of the sacrifices he made for his Art and of his devotion to it, you speak absolute and unadulterated nonsense.'

My reply to that critic was that, shrewd as was his summing up, the verdict he had brought in was entirely unjust. Never was there a worker who was more wholly an artist than Sharp, or one who was more willing to sacrifice not only health and wealth but life itself to his Art. Money never weighed with him for an instant. On the contrary, he was willing and proud to remain a poor man to his life's end

rather than put the least of his great abilities to an unworthy use. A man by no means without vanity, a man who loved sympathy and appreciation, he was to the last willing and anxious for Art's sake to forgo the lionising, the honour, and the applause to which as 'Fiona Macleod' he was entitled, rather than to shatter the lovely illusion, the exquisite and romantic wraith, which his poet-soul had made so real to himself and to his readers.

Whether, in the merging of his own identity with this fairer and other self by which he was obsessed, he was justified—even in the interest of the Art that he loved—in flatly and explicitly denying that he was Fiona Macleod is quite another matter.

Mrs Sharp tells us that her husband was indignant at what to him was an unwarrantable interference with the privacy of the individual. That, I may be permitted to remark, is all very well so long as a man remains in privacy, or so long as he issues a book for private circulation only. But if he has of his own choice (for no one can compel him to do so) elected to come out of the privacy and to publish and advertise a book, thus inviting, in effect, the public to interest itself in that book by purchasing it, he can hardly, without affectation, complain if those thus interested manifest some curiosity in regard to the personality of the writer, for such curiosity and interest are tributes to the originality and power of the book. That Sharp should, in Fiona Macleod's name, send copies of her work to eminent writers with accompanying complimentary letters about these eminent writers' own work, and then complain because the literary world was agog to know who Fiona Macleod really was, seems to me a little unreasonable.

For instance—I quote from Mrs Sharp's profoundly interesting and fascinating memoir of her husband—as Miss Macleod Sharp wrote to Mr George Meredith as follows: 'Naturally, I was eager it should appeal to you, not only because I have long taken keener delight in your writings than in those of any living writer, but also because you are Prince of Celtland.' M. Anatole Le Braz was hailed by her in a letter as 'the foremost living exponent of Breton genius.' To Mr Ernest Rhys she said: 'There is, I take it, no one living who could interpret Davyth ap Gwilym and other old Welsh singers as you could do.' To Mr W. B. Yeats her words, among others, were: 'I love your work and take an endless delight in your poetry, and look to you as not only one of the rare few on whose lips is the honey of Magh Mell, but as one the dark zone of whose mind is lit with the strange stars and constellations of the spiritual life.' In sending one of her books to Grant Allen she said that he was 'the most brilliant champion of the Celtic genius now living'—a position, by the bye, which she had already in effect accorded to Mr Meredith.

Not unnaturally, these and other writers whose

ardent admirer she professed herself in such terms to be discussed the work thus brought to their notice, and wondered who was this Nymph from Nowhere, or asked themselves whether it was possible that this literary Will o' the Wisp was no woman at all, but merely handsome Will Sharp in a petticoat. One of them, Grant Allen, who had sent the supposed Miss Macleod a generous letter of appreciation, had reason thereafter to think that he had been hoaxed, and wrote to Sharp a letter in which, for all its friendliness, there is a spice of resentment. 'If she turn out to be W. S.,' he said, 'I shall owe you a bad one for it; for I felt my letter had just that nameless tinge of emotion one uses to a woman and a beginner, but which would be sadly out of place with an old hand like yourself.'

That others beside Grant Allen should thus early have guessed the secret is no matter for wonder, for the heat with which Sharp repudiated the assertion that he and Fiona Macleod were one and the same person did more to 'give the game away' and to cause others to draw their own conclusions than if he had smilingly refused to answer, as was the case with the author or authors who were charged with being 'David Lyall.'

Personally I think Sharp would have done well to have followed the example of David Lyall. That there is no similarity between the work of 'Fiona Macleod' and 'David Lyall' is perfectly true; but each writer appeals to a special, if entirely different, public; and 'Who is David Lyall?' was as frequently asked by one set of readers as 'Who is Fiona Macleod?' was asked by another. As in the case of Fiona Macleod, rumour sometimes attributed the 'David Lyall' stories to one particular man of letters, sometimes to a collaboration between a man and a woman, and at other times to a well-known lady novelist. But, unlike Sharp, the author or authors of 'David Lyall' wisely refused, so far as I am aware, to be drawn into making any definite statement, with the result that to this day the outside public at least—I am not speaking of those inner literary circles in which no secret of the sort can long be maintained—is as mystified and as uncertain as ever, for when I go lecturing in Scotland and the provinces the question 'Who really is David Lyall?' is put to me time after time in every town I visit.

More important still, David Lyall did not tacitly and in effect allow it to be supposed that men and women of letters are licensed libertines

in the matter of playing fast and loose with facts, and that their explicit and deliberate 'Yea' or 'Nay' means nothing. To me it is a serious reflection upon the profession of letters that a man should pass his word, and not only not be believed, but that, so long as it is merely a question of the craft by which he gets his livelihood or in which he has made his name, no one should expect him to speak the truth.

That this is the view generally entertained I have reason to know from a personal experience, which, since it is very much to the point, I may be pardoned for relating here.

Some years ago Mr Elkin Mathews asked me to preface a striking, original little book, published by him, and entitled *The Views of Christopher*. In my preface I explicitly stated that I was not the author of the book; yet, because some of the reviewers found, or fancied that they found, a resemblance in thought or in style to my own work, no less than eight of them refused to accept my disclaimer, and asserted there could be no doubt but that I, and no one else, was the author of *The Views of Christopher*. And what staggered and astounded me most was that not one of the eight seemed to think one penny the worse of me for having deliberately said what, according to them, I knew to be untrue.

This seems to be a state of affairs which is neither admirable in itself nor complimentary to literature, and I venture to think that for the credit of our craft it would be well if authors realised that, great as is the license allowed them in their capacity as writers, when in their own name they make a definite and explicit statement they must keep facts apart from fiction, and must remember that the same good faith is expected from them as is expected from the ordinary man of business or man of the world.

If curious folk impertinently concern themselves with an author's business, or put to him a question they have no right to ask, he is fully justified in giving them such answer as in his discretion seems most likely to leave them no wiser than they were before. There is no obligation upon any one voluntarily or under pressure to acquaint others with his private business, but there is an obligation not deliberately and in set terms to say what is untrue. A man's word, *given as his word*, should hold good, no matter what his occupation. Else what is to become of what Mr Watts-Dunton in a memorable line so finely calls, 'Truth's own reward—belief'?

ATLANTIC GOLD.

CHAPTER V.

LONG before midnight Arcus fell asleep to a din of wind and rain. He awoke amid a great stillness. Switching on the light, he consulted the carriage-clock at his bedside—his

watch had stopped work the previous morning. Nearly four o'clock. He got up, finding his stiffness and soreness almost gone, thanks to Hubert's treatment, and went over to the window.

He drew back the curtain. It was like waking to a dream. The atmosphere was saturated with moonshine; wet rocks made frozen fantasies with the lustrous and shades of gray satin; the sea was heaving quicksilver. He unfastened the weather-proof window, whereupon the hush was broken by the sound of the swell on the shore, and the clean, strong air met him, a breath of ecstasy. His senses became alert; his soul was stirred.

Twenty-four hours ago, at the end of his endurance, he had stumbled through that cleft in the rocky wall, fugitive from hurricane to harbourage. The passage was not so narrow as he had imagined it in the streaming darkness, and it was open to the sky. Through it he saw a vista of sea broken by an islet—doubtless the Other Island, as Miss Helmsdale had called it. Arcus judged it to be a mile away. The *Vesta* must just have missed it towards the end of her wild voyage. What a marvellous escape!

As he closed the window a point of light, vividly green, sprang into sight. Near the summit of the islet it appeared, lingered, and went out. Almost at the same moment one of the black protuberances on the crest of the wall to the right of the passage moved and became the head and shoulders of a human being. Presently the green spark began to come and go in a jerky, erratic fashion.

At the end of a minute Arcus smiled. 'The two wonderful men are talking to each other,' he said to himself, and went back to bed. He recognised the Morse alphabet, but it was none of his business.

Sleep was coming again, when, after a discreet tap, Hubert opened the door.

'Anything wanted, sir? I saw the light in your window.'

'Nothing wanted, thank you. Glorious night, isn't it?'

'Indeed, sir. The doctor hopes to welcome you at breakfast. Good-night, sir.'

Wondering what his host would be like, Arcus fell asleep. He dreamed of a green star that shone on a woman's forehead, and woke to find Hubert at his bedside with tea.

'The doctor is making ready to leave the Other Island,' was Hubert's news.

Miss Helmsdale and the guest met in the hall.

'Hubert tells me you are well this morning. I am glad!' she said. 'Will you come with me and meet my uncle?'

They went out into the warm sunshine. It was about nine o'clock.

'That is our lookout tower,' she informed him, pointing to the rock whereon he had seen Hubert in the moonlight. Steps had been roughly hewn in the steep; a recess capable of holding two persons had been cut at the top. Beyond the passage he beheld the remains of the *Vesta*; they had been dragged above high-water mark.

'You were so fortunate as to arrive at full tide,' she remarked, 'and upon the only beach

on the island. All the rest of the shore is rock. An inhospitable place!'

'So it must have been before you came,' he said warmly, glancing round the shallow little cove.

'The doctor has started, miss,' said Hubert, who had donned fisherman's boots and doffed his jacket.

A dingy came rapidly towards them, mounting and disappearing between the smooth, broad rollers. The rower had evidently abundant muscle. On nearing the shore, however, he slackened speed, and picked his way cautiously. As he shipped oars Hubert ran into the water, seized the bow, and drew the dingy beyond reach of the following roller.

The rower disembarked briskly—a small, wiry man, with quick, hazel eyes, a Napoleonic nose, a wide, mobile mouth, excellent teeth, and a complexion like fine leather. You would have put his age at forty until he raised his broad-brimmed slouch-hat, discovering a wintry poll.

He nodded his thanks to his man, chirped 'Morning!' to his niece, flicking a kiss on her cheek, and advanced to his guest.

'Mr Arcus, I am delighted to meet you. Welcome to Laskeir! Your ill-luck is our good-fortune,' he said in a pleasant, clear voice, and shook hands warmly. 'I only wish you could have come to us without such material disaster.' He glanced at the wreck, sighing, 'Poor thing! And such personal risk! But let me congratulate you on your safety, and believe that I greatly regretted not being free to welcome you sooner. I trust you have found your lodging fairly comfortable?'

The young man's reply was enthusiastic.

'Ah!' said Helmsdale, looking honestly gratified, 'I can always depend on Miss Florence'—he took the girl's arm; 'and, between ourselves, Mr Arcus'—he lowered his voice—'Hubert is a wonderful man. Now, let us help him to haul up the dingy, and then to breakfast. I had a swim an hour ago, and want only a shave to make me fit for the table.'

The blithe heartiness of the man dispelled any lingering doubts that Arcus may have had of his reception; and when they met at breakfast the host was once more impressive in his assurances of the guest being welcome.

'My only fear is lest you find our island confined and dull before the month is up. Still, we shall do our best until the *Phyllis* calls,' he said. 'My niece has told you that the yacht comes but once a month?'

'There is little likelihood of my finding dullness here, Dr Helmsdale,' Arcus politely said, and halted.

Miss Helmsdale read his thoughts. 'Mr Arcus has business that demands his going as soon as possible. He was bound for the whaling station in Harris, you know.'

'Yes,' Helmsdale shook his head. 'It is an empty sea hereabouts, Mr Arcus, especially at this season. But we must keep our eyes open

and our rockets ready. Next year I must lay a cable to Harris, or go in for wireless. My niece sometimes feels rather out of the world here.'

'I don't!' said Miss Helmsdale, but not altogether convincingly to the ears of the young man.

Her uncle eyed her kindly. 'Perhaps your patience may be rewarded sooner than you imagine, Florence. It is just possible that I may attain the two million mark within a year from now.' He turned to Arcus, and with the utmost frankness explained his last remark. 'You are by this time aware of my business on these islands, Mr Arcus—the recovery of gold from sea-water, until now a problem of science. Later on I shall do myself the pleasure of showing you something of my practical process, and of answering—well, *most* of the questions you may feel disposed to ask. I may now anticipate one question which will quite naturally occur to you, whether you put it into words or not: When am I going to stop? My answer is: When I have recovered gold to the value of two millions sterling.'

'Oh!' murmured Arcus, amazed less at the statement itself, perhaps, than at its cool, mild utterance. With a somewhat foolish laugh he added, 'Would not one million do?'

'Had I not already passed that figure it might,' the host returned, presenting his cup for more coffee. 'But'—with a smile—'I have vowed that two millions shall be my limit.' To his niece, 'There now, Florence, you have a witness to my words! Two millions, and you quit this prison!' His bright eyes danced back to his guest. 'No man ever had a more devoted helper,' he said softly, and at once changed the subject by asking for a full account of the *Vesta's* ill-fated voyage.

After breakfast Helmsdale suggested an inspection of what he termed his 'domestic plant'—namely, the oil-reservoir, the dynamos, the apparatus for distilling sea-water.

'There is no spring on the island,' he informed his guest, 'and the rain, though plentiful, falls on too confined an area to make its collection worth while. I believe Hubert uses all he can get for washing his face. You may have noticed his fine complexion?'

'I should not have taken the water I have drunk to be distilled,' said Arcus. 'Your tea, for instance'—

'The water for drinking purposes is slightly aerated and treated with limeshell, otherwise it would be too flat and soft. In small matters my notions are deplorably luxurious.'

Arcus laughed. 'Don't you mean in all matters, Dr Helmsdale?'

'By no means. When necessary I can rough it with any man. I have had my adventures, Mr Arcus, and I have known poverty—even hunger. But I have also learned—well, for instance, that the liqueur Green Chartreuse tastes best from a cup of chemically pure gold at a temperature of 42.5 Fahrenheit.'

Arcus surmised that he was being chaffed. 'Atlantic gold, I presume,' he said, with ill-restrained flippancy.

'Atlantic gold, recovered, purified, and hammered by myself,' said the other, bowing gravely. 'Decorated by my niece,' he added. 'Hubert shall dispense my prescription with our coffee to-night. And now you might care to glance through my laboratory. Pray believe that I do not confine myself to gold-grubbing. Fortunately, my gold extractor—or perhaps I should say attractor—can take care of itself for considerable periods, and I am permitted to devote time to my hobbies—colour-photography, to mention one of them. You are not interested in these things perhaps?'

'I'm an interested ignoramus. It will be kind of you to admit me to your laboratory, Dr Helmsdale,' said Arcus. 'Your secrets will be safe from me, at any rate,' he added lightly.

'I have but one secret that is of any real importance,' returned Helmsdale, a trifle grim, 'and I should be sorry to think it was aught but absolutely safe from discovery. Come, then,' he concluded, and led the way back to the house.

The laboratory was reached from the sitting-room. Arcus had previously noticed the door, with its Yale lock, in the white wall. He was not altogether surprised to find the inside of the door metal-lined. The walls were treated in similar fashion, and enamelled white. The floor was of concrete. There were no windows, as Arcus perceived when his guide switched on a number of lights, yet it was plain to his lunge that ventilation had been provided for. The atmosphere savoured of chemicals, but was in no sense oppressive.

'One must guard against fire,' Helmsdale observed, his eyes following those of Arcus. 'I have not thought it worth while to insure against burglary.' He passed to the end of the laboratory and unlocked a steel door.

The safe was as high as himself, four feet broad, and five feet in depth. As the door swung back the interior became illuminated. The visitor perceived the gleam of steel—pieces of machinery, he guessed; also a glimmer of yellow metal.

'Here,' said the host, 'I keep certain delicate apparatus not yet protected by patent, but more intricate than interesting to a layman. This, however'—he turned, holding out an ingot—'is a sample of'—

'Atlantic gold!'

'Feel it; inspect it.'

Arcus took the slab, in size that of a man's visiting-card, in thickness about a quarter of an inch, and gazed on its dull beauty. He turned it over and saw a mirror-like surface; then he passed it back to Helmsdale without a word.

Helmsdale waved it away. 'A souvenir, Mr Arcus. Do me the honour to accept it.'

'Oh, really'—Arcus began.

'Besides, I want you to have it tested when

you get home.' The doctor laughed gently. 'You still have your doubts, you know.'

Arcus flushed. 'Not now,' he said, his eyes on the ingot. He had handled raw gold often enough.

'Well, well, your friends will have theirs. Tut, tut! Put it in your pocket and prove to your friends that I am neither a madman nor a charlatan.'

'But, Dr Helmsdale,' the young man hesitated, 'you don't want the matter advertised, do you?'

'Why not? Why should not I have visions of an Oceanic Gold Recovery Company, Limited, with a capital of five millions or so? My process remains, though I cease to work it personally.'

Again Arcus fancied he detected a jesting note; but the speaker's visage was perfectly serious.

'The more talk the better,' said Helmsdale, and reached into the safe.

'I should certainly like to show this to my friend Anstruther, and tell him of your vision. Anstruther is a stockbroker,' Arcus remarked. 'Anyhow, I'm tremendously indebted to you. I'll keep it as the souvenir of a wonderful man.'

Helmsdale grinned like a gratified schoolboy. 'Tell your friend, by all means,' he said. 'We might make him the company's broker. But never mind that now. Look here, Mr Arcus.' He unwrapped waxed paper from an ingot larger but thinner than the first, and held it up edgewise between finger and thumb. It fairly flashed in the visitor's eyes.

'Atlantic silver, Mr Arcus. I don't ask you to touch it at present. I'm going to perform a little bit of magic with it; and it has been specially prepared. Would you mind coming over here?' He led the way across the floor to what struck Arcus as a large and odd-looking camera. 'Pray sit down,' he said, indicating a chair. Then an idea seemed to strike him. 'Would you mind going into the next room and taking a chrysanthemum—a pink one, if you like—from the table?'

With some resemblance to a shy member of an audience induced by a conjurer to step upon the stage, Arcus went upon his errand, and presently returned with a pink chrysanthemum.

'Please place it in your button-hole and be seated,' said his host. 'Try to look a little happier than one usually does at the photographer's!' He laid the silver in a slide, which he inserted in the back of the camera. 'Now we must submit to a moment's comparative darkness.'

He moved one switch, and all the lights went out. He moved another, and a crackling of electric sparks, which Arcus could not see, invaded the silence. The crackling, however, soon developed into a steady purr, and the atmosphere became suffused with a faint bluish luminance which could scarcely be described as light. Arcus felt rather than saw it.

'Now, steady!' murmured the doctor; and a second later, 'Thank you, Mr Arcus!'

The purring ceased; the switch snapped; the

bulbs filled with white light. Helmsdale took out the silver plate, washed it carefully first in a porcelain bath of heavy-smelling liquid, then under running water. Finally he dried it very cautiously over a spirit-flame.

He handed it, slightly warm, to Arcus, observing, 'Not so cheerful as you might have looked.'

Arcus saw himself as in a looking-glass. 'I say!' he exclaimed.

From a drawer Helmsdale took a sheet of very white, highly glazed paper, and spread it on the bench under a shaded bulb, which immediately emitted a powerful yellow light. 'Allow me,' he said, and taking the silver with his right hand, held it end up on the paper, while with his left he adjusted the bulb so that its beam fell on the photograph. With a little manipulation, a clear reflection was thrown upon the white paper. But the reflection was a naturally coloured portrait of Arcus's head and shoulders, and of the delicately pink chrysanthemum, tiny but distinct, against the gray tweed.

'Magic indeed!' cried Arcus, staring.

Helmsdale pushed the silver over to his guest. 'Puzzle your friends with it. Kept in a cool, dry place, it should last for years.'

This time there was no doubt about his jesting, but an instant later his tone was serious enough. His forefinger tapped the blank paper. 'It's a small thing I have shown you,' he said. 'It would have been a bigger thing if you were *still* looking at your reflected image *there*, colours and all, *with the original in your pocket*. Would it not, Mr Arcus?'

'I don't know that I should be much more astonished than I am, Dr Helmsdale. But—but you don't mean to tell me you could show me that?'

Helmsdale went on tapping the paper. 'It can be done. With a certain paper and a certain light it can be done. I wish I could show you it being done!' he cried, with sudden impatience. 'One gets tired of performing without an audience. It's not that I'm afraid of giving away a secret. You could see the thing done, yet understand nothing.' He doubled his fist and smote the paper. 'Lord! I wish I could show you—show you the biggest thing done since the invention of the dry plate. But I can't!' He sighed. 'You see, it's dangerous. You might get . . . well, there are fumes . . . damnable. . . . Some day I'll get caught myself.' His voice trailed off into an absent muttering.

Arcus gazed at his piece of silver like a man who avoids the sight of another's emotion.

Then his host laughed. 'Strange thing the human craving for human applause! There are times when we would ruin ourselves for it.' He touched Arcus on the shoulder. 'Come, my friend, and take a look round my benches.'

He was explaining a little machine that drew lines, and made dots, and did other wonderful and delicate things in fabulous numbers to the

square inch, when Hubert tapped and announced luncheon.

'But you were not listening, or at any rate you were not taking in my remarks, Mr Arcus,' Helmsdale said pleasantly, as he replaced the glass cover over the complicated mechanism. 'You were thinking all the time either of my Atlantic gold or of my colour-photography.'

'It was the latter, and I don't apologise,' Arcus replied. 'I was wondering if you could apply

it out of doors. As far as I could judge, you have not yet applied it to scenery, and so on.'

'Ah,' said Helmsdale, 'you notice things! No, my process would not succeed at all out of doors, unless I could get absolute darkness. As for scenery—well, as a matter of fact, I'm not very keen on scenery. . . . Not very keen on scenery!' And he laughed as though his own indifference to scenery amused him.

(Continued in following section of this part.)

THE TASMANIAN PORT ARTHUR.

By F. A. W. GISBORNE.

THE world contains three places of note named Port Arthur, two of historic and mournful interest, and the third the flourishing grain-port at the north-western extremity of Lake Superior, a busy centre of commercial activity.

Much has been said and written within the last few years of the great fortress situated on the Liao-Tung Peninsula, which stands a monument of the triumphs of war rather than those of peace, and a lasting memorial of Japanese valour. But there is another Port Arthur, also situated at the southern end of a peninsula, which possesses features of interest. Like its Asiatic namesake, also, it suggests painful recollections of human suffering—suffering, however, in this case alike more protracted and bitter than that sustained by the contending hosts in and around the Gibraltar of the East, and unalleviated either by the fervour of patriotism or the hope of fame. To the Tasmanian Port Arthur belongs the melancholy distinction of having been for nearly half the last century the site of one of the largest penal settlements in the British dominions.

The coast of southern Tasmania is of extraordinary irregularity. To the extreme south-east of the island is to be found a singular kind of double peninsula, shaped somewhat like an hour-glass, the lower division, however, being much the larger of the two. The northern portion of this double peninsula is called Forestier's Peninsula, the southern Tasman's Peninsula. The southern coast of Tasman's Peninsula is cleft at the centre by a deep, irregular inlet, barely a mile in width at the entrance, but widening northwards into a spacious basin, for a large part completely landlocked.

A voyage of about four hours' duration in ordinary weather takes the traveller from Hobart to Port Arthur. In extraordinary weather a wise tourist would choose the land route, which, though longer, furnishes very interesting scenery. Motor conveyances run regularly during the summer months between the two places, covering the sixty miles of intervening road in about the same time that the steamer takes to cross forty miles of water. If he prefer it, the visitor can combine land and water travel by voyaging by

sea to a small town called Nubeena, situated on the western side of the peninsula, and either walking or driving the remaining six miles required to reach Port Arthur. This is the shortest and most direct route of the three. In the writer's opinion it is also the most interesting.

Nubeena itself is a place well worth seeing. During a late stay in the locality, the writer and a friend, an experienced orchardist, visited what bears the reputation of being the most productive orchard for its size in the whole of Tasmania. From a diminutive plot of ground only three-quarters of an acre in extent the fortunate owner gathers on an average about eight hundred bushels of apples every year, and he has obtained a thousand bushels in a single season. Almost every tree at the time of our visit had its branches supported by props to prevent their breaking under their loads of fruit. Some twelve acres of land adjacent had been planted with young trees, and scattered about the district were young orchards, all of remarkable promise, embracing a considerable area of ground. Apparently rather tardily the residents have discovered the most profitable way of utilising their properties, and are now busily engaged in preparing to send extensive supplies to Covent Garden by-and-by. To the prospective fruit-grower Tasman's Peninsula may be recommended as one of the most promising fields for his industry. Land is plentiful and cheap—from ten shillings to a pound an acre when purchased from the Government—transport facilities are exceptionally good, and the climate and scenery all that can be desired.

So much for the general features of the country adjacent to Port Arthur. Between Nubeena and the old penal settlement the road, rather more than undulating, traverses for the greater part virgin forest, cultivation being still chiefly confined to the seaboard. From the crest of the hill overlooking Port Arthur a magnificent view is obtained. Lofty, naked ridges shut out the ocean from the view; and the sheet of placid water, dotted with wooded islets, and thrusting long, sinuous arms into the dense forests that surround it outside the limited area of cleared ground embraced by the town-

ship, resembles an Alpine lake. Scattered along the shore, directly below the spectator, may be seen the dismantled remnants of what were once extensive prisons, barracks, and other buildings connected with the old penal establishment, interspersed among the dwellings of the few present inhabitants of the place. Carnarvon, as the modern township is styled, does not bear the appearance of prosperity. The second growth of population on the spot, numerically at least, is far behind the first. Only a handful of about one hundred and fifty people are now to be found near Port Arthur, and considering the splendid harbour close by, the abundance of land fit for cultivation within easy reach of it, and the unrivalled scenic and climatic advantages enjoyed, the stagnation of the place appears difficult to explain. King George's animating exhortation, 'Wake up!' might certainly be addressed to the people of this Sleepy Hollow.

A stranger would do well, on visiting Port Arthur, to engage the services of the local guide. The father of this functionary was in former times an important member of the prison staff, and the son is thoroughly conversant with the past history of the settlement. Under his capable guidance the present writer and his companion spent a very pleasant morning looking over the various places of interest, and listening to the eloquent explanatory discourses of our cicerone. We first visited the remains of the old church, a building once of considerable size and real architectural merit, substantially constructed of sandstone, and erected entirely by convict labour under the supervision of a convict architect. The latter, one heard with satisfaction, received a free pardon as a reward for his services. Only the outer walls and the square tower, surmounted by four slender spires, are now standing, the whole draped and festooned with luxuriant masses of ivy. The spaciousness of the building may be estimated by the fact that it used to accommodate a congregation exceeding two thousand persons, the majority of course consisting of convicts, who were duly marched up from their places of confinement, escorted by armed guards, every Sunday morning to listen to the admonitions of the chaplain. Warders with loaded rifles were stationed at various points in the building to prevent any worshipper making a stealthy and unauthorised departure. The edifice, perhaps the finest of its kind in the island, was in regular use by the local inhabitants till about a quarter of a century ago, when, most unfortunately, owing to the carelessness of a stupid fellow engaged in burning off fallen timber on the hillside behind, the dry shingle roof became ignited by a flying spark, and in a short time the whole combustible portion of the building was consumed—a great and irreparable loss. Only a few years after the destruction of the church some rustic Nero kindled a second and

even more devastating conflagration. On this occasion the flames swept through the whole town and consumed all but the brick and stone walls of the principal penal buildings, up to that time standing just as they were when the evacuation of the settlement by the prisoners and garrison took place, leaving all these relics of old times dismantled, roofless, and blackened.

During the period of almost half a century—to be exact, forty-seven years—following the year 1830, when the penal settlement at Port Arthur was first formed, the locality was a scene of busy human activity. Its population consisted then of about three thousand people, one thousand two hundred and sixty being prisoners, and the remainder chiefly warders and officers and men belonging to the garrison. Only a few civilians were specially licensed to live there, and no free agricultural settlement in the back country was allowed. The whole of Tasman's Peninsula, in fact, constituted an extensive prison domain. Two large buildings accommodated those of the unwilling residents who were sound in body and mind; two more, a hospital and an asylum, the incapacitated, usually, it is to be feared, comprising a considerable proportion of the whole population. Of the former pair, the penitentiary was a huge, barrack-like edifice four storeys high, and designed to hold one thousand two hundred prisoners; its companion edifice, known as the 'model' prison, was much smaller, being intended to accommodate only sixty men, the dregs of convictdom. The 'model' prison, we were told, was so called because it was built in exact imitation of the well-known English establishment at Pentonville. To its unfortunate inmates, all convicts of the worst type undergoing life sentences, it must have seemed a veritable mansion of the dead. The corridor-floors were covered with thick matting, along which masked warders, wearing felt slippers, paced noiselessly to and fro. No conversation of any kind was permitted, and Trappist discipline prevailed. At fixed times each prisoner's allowance of food was pushed through a grating into the cell where he passed the weary hours in complete and hopeless solitude. In rotation, for one hour a day, each captive was privileged to take exercise. The recreation-ground consisted of a fan-shaped enclosure about half an acre in extent, and surrounded by massive stone walls some fifteen feet in height. This space was accurately divided into five wedge-shaped divisions, with walls between, and into each, at the narrow end, a massive door opened from the prison. When their turn came five prisoners were let loose into these five charming little parks to disport themselves and survey the landscape for exactly sixty minutes, their leg-irons, however, not being removed lest they should endeavour to obtain a wider view from the summit of the wall. On one occasion, despite this precaution, a prisoner of extraordinary agility and daring did actually

succeed in escaping; but after taking a considerable amount of rather painful exercise in the bush, he was recaptured and severely disciplined. After this episode, to check further displays of enterprise of the kind, the recreation-ground was covered by a sort of gridiron of stout, close-set iron bars. When his hour of bliss was over, each prisoner was reconducted to his cell, there to remain for the next twenty-three hours in sunless seclusion. With a stone floor beneath him, stone walls around him, stone ceiling above him, and only a narrow, barred slit high up to afford admittance to a few rays of light, the condition of the unfortunate convict must soon have become one of mental and moral petrification. The cells resembled but enlarged sarcophagi. Appropriately enough, just behind this voiceless abode of woe was situated the prison asylum, which, our guide told us, was usually crowded with by no means taciturn patients. There 'moody madness, laughing wild,' mocked the resources of discipline. Only for a brief space, however. The asylum served but as the stepping-stone between the model prison and a yet more silent place of incarceration in the quiet bay beyond.

Before leaving this gloomy spot we were shown a couple of sepulchral cavities in which, as the severest form of punishment of all, not excepting the gallows, refractory prisoners were subjected to the dreaded ordeal of confinement in the dark cell. The darkness in each of these was such as would be experienced at the bottom of the deepest coal-mine; ingenious means even had been devised for excluding the passage of light through the orifices required for purposes of ventilation. Thirty hours formed the maximum period of detention in these dungeons. At its expiration the most hardened desperado would emerge, temporarily blinded and utterly unnerved, if not mentally wrecked. The severest flogging was preferred by the convicts to this form of punishment. Its terrors, no doubt, were intensified often by an evil conscience and those haunting superstitions that usually afflict low natures. While the writer and his companion were quite of opinion that thirty hours in so uncomfortable a place of meditation would be trying, especially as no conveniences of any kind for repose were provided, they nevertheless agreed in preferring such an experience to receiving the ministrations of the prison flagellator.

Compared with the model prison the penitentiary must have presented quite a cheerful aspect. The building commanded a lovely view over the adjacent harbour; its inmates enjoyed plenty of society, and were provided with abundance of occupation. They were also well fed and looked after. The prison kitchen, with the huge ovens in which bread for three thousand mouths was baked daily, still remains in fairly good condition. The tasks of the men were various. In detached buildings, of which scarcely a trace now remains, there were carpentering, tailoring,

bootmaking, and other workrooms, as well as a large tannery and sawmill to provide some of the required materials. The skilled men engaged in these establishments were, no doubt, the envied aristocracy of the community. The great majority of the convicts, however, were employed out of doors. Early every morning, no matter what the weather, at a fixed signal the various gangs were mustered outside the chief gateway in charge of their respective warders, and marched off to their day's labour. Some were employed in cutting and hauling timber, some in clearing and cultivating land, some in quarrying stone, and many in making roads and constructing various buildings. Nearly all the latter have since disappeared, partly owing to the great fire, but chiefly by reason of the rather paltry spirit of economy that influenced the colonial Government in office at the time when the imperial authorities finally relinquished control of Port Arthur. Scores of substantial stone and brick edifices were sold at trifling rates to Hobart building contractors, and their materials shipped off to be used elsewhere.

Once the convicts were locked inside the prison buildings escape was practically impossible. But when engaged out of doors, often in the dense forest, daring men not infrequently made a bolt for liberty. Some were shot when making these attempts, others recaptured and flogged, or subjected to solitary confinement; a few, for the time, escaped. Of the latter, many perished miserably in the bush. But a short time ago the skeleton of one of these unfortunates was found by a settler while clearing his land, the rusted irons still clasped round the bleached leg-bones. Several unhappy wretches, after days of starvation and exposure, returned to the settlement and voluntarily surrendered. Hideous stories of cannibalism such as those recorded in Marcus Clarke's famous romance *For the Term of his Natural Life*—a title of bitter irony—still linger among the old settlers in the neighbourhood, and some at least of these are undoubtedly founded on fact. The primeval forest, to a man destitute of a weapon and impeded in his movements by leg-irons, provided no sustenance. Even shellfish can scarcely be procured along that iron-bound coast. No edible roots or berries are to be found. Boats being absolutely unobtainable, the only hope of salvation to the fugitive lay in reaching the comparatively settled districts outside the peninsula, some twenty-five miles to the north. But at the first of the 'necks' of land a strong guard was always stationed; and, moreover, across the hundred yards or so that separated the ocean on the outside from Norfolk Bay on the other a cordon of fierce dogs was stationed at night, the chain of every animal being long enough to enable it to reach its fellow on each side. These savage sentinels kept unceasing watch on land, while boats with armed crews patrolled the adjacent water lest some possible swimmer, who had previously contrived to rid

himself of his irons—an almost impossible feat—might brave the sharks in an attempt to escape the vigilance of the human and canine guards. In the whole history of Port Arthur, it is said, only one runaway convict, afterwards a noted bushranger, succeeded in making good his escape by land. The well-known Irish exile Smith O'Brien, whose comfortable little cottage still stands on an eminence overlooking the harbour, did certainly succeed in getting away by sea; but he was treated with exceptional indulgence, and had special facilities for escaping. The ordinary convict necessarily lacked the means to bribe the owner of a vessel to take him away, apart from the almost insuperable difficulties in the way of carrying on a negotiation. An odd prisoner or two escaped with the connivance of local fishermen; but very few indeed enjoyed this good fortune. The ordinary runaway's choice lay between being shot, starving, and, literally, going to the dogs.

As we look across the harbour from the now desolate penitentiary, a bold and wooded promontory and a small islet just off its extremity arrest the attention. Both objects suggest grim memories. On the promontory, which bears the quaintly classical and appropriate name of Point Puer, was once situated a large jail in which were confined several hundred boys from ten to fourteen years of age. Scarcely a trace of the building remains. But the precipice now known as Suicide Cliff close by recalls to the visitor's memory the pathetic tragedy recorded in one of Marcus Clarke's chapters. Two unhappy child-

convicts, desperate from ill-usage, here leapt into final freedom. The little mound of rock and earth rising from the calm waters beyond possesses even sadder associations. This is the well-known Isle of the Dead. It might well have seemed an isle of the blessed also to many of those whose eyes in former times no doubt frequently turned yearningly towards it. Beneath its three or four acres of surface, now thickly overgrown with bushes, repose the remains of no fewer than one thousand two hundred former convicts and more than three hundred civil and military officers and soldiers. No external sign whatever marks the spot where each prisoner was buried; his worn-out remains seem to have been summarily thrust underground and covered up. But it is painful to observe the neglected condition of such graves as still possess headstones, and still more sad to notice in most cases the youth of the victims. Evidently there was something rotten in the sanitary state of Port Arthur in the early days; otherwise young men mostly under thirty years of age would not have perished by scores. Perhaps the moral malaria that then brooded over the place reacted disastrously on the physical constitutions of its inhabitants, free as well as bond. On both alike the hand of Death seems to have fallen equally heavily. Happily the curse of suffering and mortality that for many years afflicted this beautiful spot has long passed away, and Port Arthur now ranks as one of the most healthful places in an island whose equal for salubrity can hardly be found elsewhere in the British Empire.

THE GUARDIANS OF THE MOLE.

By HARRY ESCOURT.

BENDING his long, wiry body as he reached the doorway of Messer Recco's house, in the Banchi quarter, Martino Cassini, the Genoese gunner, listened intently. Reassured by the silence, he entered cautiously. 'There are no cursed Austrians quartered here,' he muttered, 'or all were not so quiet. My little Cristina has been spared that, the saints be praised!'

Martino had taken but a stride or two down the passage, however, when a stifled shriek fell on his ears. His hand flew to his knife, and in a couple of bounds he had burst open a door, to find his sweetheart struggling feebly in the arms of an Austrian officer. With a fierce oath, Cassini caught up a stool, and, as the intruder turned from the girl, brought it down with a crash on his head. The man fell heavily, and in a moment Cristina had flown to her lover and lay trembling in his arms. Clasp her in a passionate embrace, for a time Cassini vainly endeavoured to calm her. But presently she sank into a chair, striving bravely to check her sobs, and he stooped over the Austrian.

'Have—have you killed him?' gasped Cristina.

'The man is but stunned,' replied Cassini bitterly. 'Would I had struck harder!'

As Cristina buried her face in her hands, a startled exclamation burst from her lover. Rising hastily, he threw a heavy purse and a package on the table. The girl looked up, scared anew.

'These were within his doublet,' said Cassini. '*Diavolo!* we are no robbers. The purse I cannot touch, but I will see what may be in this.' Swiftly he disclosed papers and a soft leather bag. 'Plans!' he exclaimed. 'Orders from their General! These must to the Doge.' As he spoke the man on the floor stirred and groaned. In an instant Cassini caught up the Austrian's pistol.

'No, no!' implored Cristina.

'He deserves no less,' growled her lover, thrusting the weapon beneath his cloak reluctantly, and hastily bundling together the papers and leather bag. 'Take them, Cristina. They will be safer with you for a space. Now, quickly,

little one! 'Tis a halter for both of us to stop here now. Come!' And, grasping her hand, he hurried her along the passage.

'But where? Where can we hide?' gasped the girl.

'Fear not, my Cristina. Keep but a brave heart. The worst is not yet.'

'Ah, were only my—my father here!' she faltered.

'Can I not protect you as well?' whispered Cassini reproachfully, as they hastened along in the rapidly failing light.

The girl's only answer was to grip his arm the tighter and turn her tear-stained face to his. Who shall blame him if he halted a moment to imprint a passionate kiss on her pure brow? But that instant's delay came near to being their undoing; for, as Cristina's arms crept round her lover, an Austrian patrol swung into sight, and Cassini had barely time to draw the girl down a narrow lane to escape their vigilance.

As they crouched together in the shadow of a doorway, Cassini scowled his hatred of the invaders. 'Mark the rascals, how they strut!' he muttered. 'Genoa is theirs, they say! And they will even carry off our guns on the morrow—my very mortars from the Mole! Ah, by the saints! to-morrow is not yet.' And he ground his teeth in sullen rage.

As the steady tramp of the soldiers' feet died away, 'How came it that you were alone, Cristina?' asked her lover.

'My father went to Messer Durazzo the armourer,' she rejoined nervously. 'His son Roberto, your friend, brought a message but a short hour back.'

'Ha! and there we will go also, my heart!' exclaimed Cassini. 'Giulio Durazzo can find you safe hiding. Ay, and find us arms!' he added between his teeth, as he cautiously led the maid, still trembling, down the dark passage.

'But—but my father will be angered,' she faltered. 'He has been strange and hard to me since'—

'Since I claimed your hand, sweet one?'

'Yes,' she sighed. '*Ohimè!* you know that he will not hear of it.'

'Messer Recco is hard to please,' said her lover bitterly. 'Ere this trouble came on us I held command of a score of men, and but for the love of dice in those before me might bear a name of the oldest.'

The girl sighed again, but made no answer as they cautiously threaded their way through a maze of narrow lanes. Presently they reached the church of St Luca, and as they hurried past it a heavily cloaked figure started out from the shadows and brushed against Cassini.

Gripping Cristina's hand, Cassini urged her forward; but, noting that the man was following them, he bade her run on some paces and await him. Then, drawing the Austrian's pistol from his belt, he turned to face his pursuer.

'Cur!' hissed the man, darting towards him with uplifted knife.

Dropping the cloak from his face, Cassini sprang aside and levelled his weapon.

'Martino!' exclaimed his assailant with a startled oath. 'Pardon, my friend; I took you for a cursed Austrian. 'Tis lucky a light burns within the church, for I had determined to strike at you and rescue the maid.'

'Good lad!' said Cassini, gripping the other's hand. 'Cristina Recco is with me, and we are making for Durazzo's house. You are of the Doge's household, Donato, and should know how things stand. Can I get a message past these Austrian guards?'

The usher shook his head doubtfully. 'I know not how I shall return,' he said. 'I was with my mother in the shadow of the passage there, waiting until those devils get enough liquor into them. Then I shall smuggle her into the palace kitchens. They have sacked our house—curse them!'

'We will come with you,' muttered Cassini. 'Cristina shall pass in with your mother if we can safely manage it.'

Donato nodded. 'We shall be better together,' he agreed. 'You have a pistol.'

As they crept silently along, two by two, keeping within sight of each other, her lover told Cristina that she must pass for a kitchen wench, and, once in the palace, do her best to get the package conveyed to the Doge. 'Will you be brave enough, dear one?' he implored. 'I cannot enter with you.'

'I will do it for you, Martino,' she whispered. 'Anything. But it is for you that I will do it.'

'Nay, Cristina, 'tis for Genoa, or you should not run the risk;' and, catching her swiftly to him, he repaid her courage with tender kisses. As they cautiously approached the palace the noise and confusion about it gave them great hopes of success.

'Perchance I can slip back myself,' said Donato. 'Stay you here while I see how things are.' He had taken but a step forward, when a louder uproar of drunken cries and oaths drew their attention to a man running towards them. Cassini pulled the women back hastily.

'*Mio Dio!* 'tis the Senator Lercari!' exclaimed Donato.

As he panted by, the old man caught the words and stopped. 'To your homes! To your homes, an ye would be safe!' he gasped. 'St Lorenzo preserve us this night! These Austrian devils are mad with drink.'

'Ay, we go,' rejoined Cassini, grasping Cristina's hand.

'A moment!' exclaimed the senator, with a scared look over his shoulder. 'Your face is known to me. I would keep by you, for my own palace is guarded, and I shall meet with naught but insult.'

'We go to Messer Durazzo's,' said Cassini

shortly. 'Come with us, *signore*. You will be welcome—and safe for the night.'

'What did you here?' quavered the old senator as he strove to keep up with them.

'We looked to pass the women into the kitchens,' replied Cassini. 'But you say it is not safe?'

'*Cappari*! no. Anywhere but there! 'Twas a mad thought.'

'The old dame has served in the Doge's household, and we thought that she could slip in with the maid,' explained Cassini as they stopped at a corner and peered cautiously into the Strada Lomellina.

'You had a reason?' whispered the senator.

Cassini nodded, and turned to Cristina. A moment after he put the package into the senator's hands. 'It will be safer with you, *signore*,' he said. 'Tis for the Doge. Austrian papers and plans. Later I will tell you how I came by them.'

'Ha!' exclaimed the old man. 'To-morrow his Serenity shall have them. 'Tis a risk, but I can do it. *Cappari*! 'twas brave of the girl.'

'Silence!' cautioned Cassini. 'The street is clear. Follow quickly.'

In a few moments they had taken a turning on the right, and stood at the rear of the armourer's house. As Cassini knocked softly a trap in the door slid back and a face peered through the iron grating.

'It is I, Cassini; and Cristina Recco is with me. Open quickly!' said the gunner in low, insistent tones. They heard a startled exclamation, and in the shortest space the door was flung open and Cristina was clasped in her father's arms.

'What means this, Martino Cassini?' questioned the old man sternly.

'Your daughter was being molested by one of these Austrian curs, and I struck him down,' answered Cassini shortly, as he hustled his companions in and barred the door.

'*Mio Dio*!' groaned Gaspare Recco, 'it wanted but that. The saints preserve us all!' And he led them to a cellar, where the armourer and his son were in anxious deliberation with a handful of sturdy citizens.

In a few words Cassini accounted for their presence, and for some moments there was a tense silence, as the men eyed one another with lowering brows and sombre looks.

'I should not have left the child thus,' quavered her father at last. 'But what could I do? All my assistants have been carried off by these Austrian devils to cut up my cloth—my own cloth. *Ohimè*! my own cloth, every length of it, carried off to clothe these murdering thieves!'

'Since your daughter's honour is saved, you are in lucky case to have lost but your goods, Messer Recco,' growled one of the men with flashing eyes. 'It is more than some of us can boast; and he swore savagely under his breath as he gripped the hilt of his dagger.

Cristina's father crossed himself with a

trembling hand, and, turning to the armourer, 'Friend Durazzo,' he faltered, 'say but the word, and my daughter and I must leave you; for we are all dead men if she be found here now. You have your own wives and children to think of.'

'Then I at least go with you,' burst out Cassini. '*Diamine*!' exclaimed the burly armourer.

'Do you know us so little as to think that of us? They break not in here so easily. And, should they make the essay, they will find that Giulio Durazzo has powder enough to blow many a score to the devil, their master.'

'I—I can never repay your kindness, neighbour,' stammered Recco. 'My cloth is gone, and I am near ruined!'

'*Cospetto*! a pest on payment. Your losses have turned your head, Messer Recco. We are all in like case. This is no time to prate of your cloth-bales, when the very silver of the churches is melted to pay this cursed Austrian levy.'

'My friends,' said the senator uneasily, 'we have blundered, and ruined our city. My word was to close the gates and withstand the enemy, as you well know. *Ohimè*! I was overruled. Yet I would counsel you to attempt nothing of yourselves. If you failed—failed!'

'But what else is left for us, *signore*?' broke in Durazzo hardily. 'We are ruined now. And who can say what fate yet more evil awaits those dear to us!'

'Listen, my father!' exclaimed his son, who had been earnestly conversing apart with Cassini and the other burgessees. 'What say you, sir, to this plan?'

And when, an hour later, they mounted to one of the upper apartments to snatch a few hasty mouthfuls from the board that the armourer's wife had spread, every face shone with renewed hope and determination that the sense of their desperate venture was powerless to damp.

It was close on midnight when they secretly left Durazzo's house by twos and threes, some to make known their plan to trusted comrades, and the armourer and his son, and also Cassini, to meet at the Batteria della Cava; from which fort, as well as from the Mole, the Austrians were to remove the mortars at daybreak.

The guns were, as they well knew, guarded by the invaders; but they counted on finding the sentries too full of liquor to prevent them from stealing up to one of the cannon under cover of the darkness; and so the event proved. For the two Durazzos, eluding the Austrian guard posted on the Ponte di Carignan, by cautiously keeping in the shadow of La Madre di Dio until they judged it safe to descend and pass by the houses under the bridge, managed in this manner to gain the dark shadow of the trees by the church of St Maria. Thence it was no hard task to make their way unmolested across the fields to St Giacomo, where they came on Cassini, who guided them to a gate in the wall, of which he still held the key.

Moving only when the bursts of drunken song from the Austrians were at their loudest, they at last reached the guns. Feverishly they worked at the carriage of one of the mortars, and at last, creeping from the black shadow of the embrasure, and throwing away their files and oil-flask, they silently dispersed. The armourer regained his house in safety, but his son and Cassini were both arrested by an Austrian patrol at dawn, and taken back to La Cava.

It was with compressed lips and flashing eyes that Cassini laboured to remove the cannon that he loved so well; but as he was surrounded by the Austrian soldiers, his hidden knife was useless, and he was forced to obey. Nor was he the only one; for, as the heavy pieces were, with great exertion, dragged through the narrow streets, the Austrians took citizens right and left from the thronging, sullen crowds, and with furious threats constrained them to haul at the guns.

At last, as they reached one of the narrowest ways, a mortar jammed in an ill-paved rut, and a hoarse murmur ran through the dense mob. The moment had come! Cassini flashed a warning glance at Roberto; and, amid the exasperated curses of the Austrians, they, with the help of some half-score Genoese who had quietly detached themselves from the press, worked with apparent goodwill to free the gun-carriage.

In a moment, with the rending of iron and wood, it gave way, and the heavy mortar crashed to the ground. As the soldiers, mad with rage, heaped curses and threats on the citizens for their maladroitness, an officer pushed his way through the struggling mass.

It needed not the Austrian's bandaged head for Cassini to recognise him instantly as the man he had struck down overnight. As the gunner was endeavouring to get at his concealed knife their eyes met. With a foul oath, the man sprang toward him, to find his way blocked by Roberto Durazzo. Speechless with rage, the officer struck savagely with his cane at Roberto, who in a flash buried a dagger in the man's side.

A frenzied yell burst from the crowd, which, at one moment bristling with knives and daggers, had in the next surged on to the Austrians, hacking and stabbing like madmen. Before the invaders could pray or curse again, there was not a soldier in the street but lay choking his life out.

Brandishing his crimson dagger, Durazzo sprang on the broken gun-carriage. 'To arms, men of Genoa!' he cried. 'To the Arsenal! To the Arsenal!'

'Death to the Austrians!' shrieked the mob, as, with a courage born of despair, they rushed down the street, breaking into the armourers' shops, and being reinforced at every turn by their fellow-citizens, who had but waited for the word to rise. Short work was made of the Arsenal gates. The powder-magazines were ransacked, and the whole population, many of the women aiding, began with despairing fury a hand-to-

hand struggle with the invaders, which quickly became a pitiless massacre.

The Austrians, taken by surprise and unable to form, were butchered like sheep; and as a last remnant of their forces endeavoured to draw off from the city in some semblance of order, Cassini, who throughout had fought side by side with Durazzo, pointed to a column of smoke rising from the direction of Maracci.

'See you not, Roberto!' he cried in a hoarse, cracked voice. 'The peasants! They have risen to aid us. We must join them and finish off these devils, or they will rally yet.'

They were seconded by a handful of nobles, and in a few minutes a small body of horse, leaving the torrent of maddened citizens to pursue the flying Austrians on foot, dashed out from the Porta dell' Arco. Making for the bands of peasants, who had dug up their arms and from all sides were hastening to the aid of their countrymen, they mustered them in some force, and, taking the flying Austrians in the rear, cut them down to a man. In all directions the pursuit trailed over the hills and valleys until the state was cleared of the enemy.

Returning to Genoa a day later, weary and faint from their wounds, Cassini and Durazzo were acclaimed by the citizens as conquerors. But, as Durazzo rode by the side of the Doge, Cassini, at the sight of a pair of tear-dimmed eyes, was well content to slip away and clasp Cristina in his arms.

Albeit it was with a heavy heart that he left her on the following morn to bear his part in the triumphant procession, in which the mortar was drawn through the principal streets amid frenzied rejoicings. For, though in the flush of his success he had again pressed his suit, Cristina's father had stubbornly refused to hear of the match.

Half-crazed with his previous losses, Messer Recco found himself faced with the smouldering ruins of his house, which the Austrian officer, on coming to his senses, had ordered to be sacked and burned in the night. In vain Cassini pleaded that he had been promised a command.

'Bah! prate not to me of marriage. We are all ruined, I say!' the old mercer shrieked in frenzied rage.

Thus Cassini left him, relieved to think that his sweetheart was still in the care of the armourer's wife.

Amid the confusion Cassini could muster but eight men of the score he had commanded before the Austrians had entered the city; but at the head of these he made his way to the palace.

As he approached, the captain of the Doge's halberdiers hurried up to him. 'Quickly, man!' he exclaimed. 'His Serenity has twice asked for you.'

In the shortest space Cassini was hustled through the crowded antechamber, and, in some bewilderment, found himself bowing before the

Doge and a brilliant group of senators and officers.

'Ha! Martino Diavicini, known of late years as Martino Cassini, is it not?' interrogated the Doge benevolently. And as Martino, taken aback, bowed again in silence, 'Nay, man, the name has stood high, and shall again,' the Doge went on quickly. 'The State owes you much, and not a little to the brave girl who would have risked all to pass these papers to my hands. Know you what the bag contains?'

'Your Serenity, there was scant time to look. I but glanced at the papers.'

The Doge slowly opened the soft leather bag that Martino had taken from the Austrian officer's doublet, and poured its contents on the table—a shimmering glitter of gems that held Cassini in speechless amazement.

'A good half of the Crown jewels of the Queen of Hungary,' explained the Doge. 'They were pledged with our merchants, and, as perchance you may not know, were one of the causes that led to this strife. The Austrians seized them, but the scoundrel you struck down—yes, I have heard all—must himself have stolen these. The Senate has decreed their return to the merchants, who are ordered to give you a third of their value, which is no more than just. To-day I am pressed, but will send for you again. The command promised you shall have.' And, as Cassini endeavoured to express his gratitude, 'Bear again your true name,

Martino Diavicini,' added the Doge kindly. 'You will now have the means, and are worthy of it.'

'Twill be a hundred thousand ducats at the very least,' whispered the Senator Lercari, as Martino stammered some words of earnest thanks for his good offices with the Doge. 'And the merchants are so overjoyed that they will give such a dowry to Signorina Recco as should make her old father's eyes start from his head.'

As the news reached Genoa that the Austrian army marching on Provence had turned, bent on investing the city and taking a terrible revenge, there was a somewhat hurried wedding in the church of St Pietro; but the building was crowded with the principal nobles and citizens, in honour of Martino Diavicini.

'Fear not, sweet wife!' he said when, having been placed in command of the city's cannon, his duty called him from her side. 'We shall give a good account of these Austrians. We have taught them one lesson, and, by all the saints, they shall learn another!'

Happily for Cristina's fears, the Duc de Richelieu marched to the aid of the Genoese, and saved the republic from the Austrian fury. And when Cristina showed her children the statue that the Senate raised to that brave Frenchman they clustered round her with wondering eyes, and coaxed her to repeat again and again the story of how their father and his friend the honoured Senator Durazzo saved the State.

DESCENT OF THE CRATER OF VESUVIUS.

By DAY ALLEN WILLEY.

MANY are the thrilling tales of mountain climbing, and the heroes who have scaled peaks far above the earth's surface are numerous. Summits of the Himalayas, the Andes, and high mountains far away from human abode have been ascended by such mountaineers as the Workmans, the Duke of the Abruzzi, and other noted explorers, in the interest of science. But one of the most daring feats to attain scientific knowledge was the exploration of a volcanic crater that has been active for centuries.

The man who accomplished this feat at the peril of his life is one of the most noted of the world's geologists, Professor Alessandro Malladra, of the Royal Observatory of Vesuvius, who succeeded in descending into the crater of Vesuvius after many attempts. Professor Malladra was accompanied by an old servant of the observatory, Andrea Varvazzo.

Starting from the brink facing Pompeii, with their first rope, four hundred and fifty feet in length, they mastered walls formed like gigantic, precipitous terraces, alternating with steep inclines. A wide, sloping ledge of lava that plunged precipitously to a depth of more

than three hundred and fifty feet was reached. The explorers turned on this ledge toward the south until they came to an incline with a 90 per cent. downward gradient. With the aid of a rope three hundred and fifty feet long they slid down the incline, and reached a huge mass of lava that had fallen as the result of an upheaval of the volcano.

Professor Malladra remained at the bottom for over two hours, studying almost every square foot, and constantly taking instrumental readings. In the fumaroles—the vents from which hot vapour ascended—the thermometer registered the very high temperature of one hundred and eighty-seven to two hundred degrees (200° C. = 392° F.). The depth of the crater is about three hundred metres, or nine hundred and eighty-four feet. From the south of the crater a small, dark, moving rectangle can be seen. There is an unbearable smell of sulphur. The fumaroles are numerous, some very close together, proving that smothered fire is present. At the bottom of the crater the explorers fixed an Italian flag on the rocks.

The result of this perilous investigation

revealed some very interesting features of the volcano. The bottom of the crater is flat, or at the most a little inclined, very irregular, and filled with fallen masses. Professor Malladra was determined to accomplish the descent so as to furnish the observatory and the scientific world with more recent information than was hitherto available. The explorer also wanted to make this descent to study an eruptive period from the beginning to the last phase.

It was only after several failures that Professor Malladra succeeded in his perilous enterprise. When he and Varvazzo attempted their first descent they lowered themselves at the north-west side and descended nearly two hundred feet, but, meeting a perpendicular wall of one hundred and twenty feet, they were prevented from continuing. They tried again five days later; but after having uncoiled a rope one hundred and fifty feet long, they saw that, owing to the crumbling which had taken place, this path was also impossible. These two vain attempts did not discourage the indomitable explorer. Every day he went to the crater, studying its mouth and its walls, until he found a way that seemed practicable.

He now communicated to Varvazzo his intention of attempting another descent. After having gone about one hundred and fifty feet they were obliged to return again. The point chosen, in this case at the south-east side, was also impracticable. The intrepid scientist then tried another road more toward the east. This was on the same day. The two descended for about two hundred feet. To their great delight, they found that this was a practicable trail. But it was already three o'clock in the afternoon, too late to continue the descent. They were obliged to come to the top again, leaving their ropes in the crater, tied to three wooden posts, so that they could continue the next morning.

In the morning the professor and his companion started, with food to be consumed nine hundred and fifty feet beneath the mouth of the crater, seventy pounds of manila and flax rope (nine hundred and fifty feet in length), a barometer, a thermometer, and a camera. They had also brought with them several fusible wires of different metals to measure temperatures higher than those for which the thermometers were graduated. They were also provided with a magnetic needle (compass), a hatchet, a stick, and plummets.

The first big wall was descended, a wall formed by the various eruptions; and this was followed by a descent over red lava in which several fumaroles opened. The temperature of these fumaroles registered one hundred and eighty-seven degrees. At this point a side-wall descended for about one hundred and sixty feet, and presented the first obstacle. Wherever the two brave men placed their feet a new fumarole opened, from which sulphur vapours poured. When the descent of this wall was accomplished

there was a second gigantic perpendicular one of lava, followed by a *talus* cone covered by a bank of lava. The continual breaking and crumbling of the surface made it difficult to escape. Isolated masses fell with tremendous noise, bounding to the bottom, and filling the air with dust and fine ashes. The professor's hands were frequently cut, and a big stone fell on the brim of his hat. Varvazzo was struck on the head, but was so slightly injured that he was able to continue the descent.

Next the two explorers discovered another perpendicular wall completely bare, with no projections or crevices of any kind. After some uncertainty, Professor Malladra was able to find a passage between two ridges of lava. At this moment he became aware that he had no more rope, as one a hundred and fifty feet in length, which he had not thought would be needed, had been left at the top. There was still another wall, descending three hundred and fifty feet, absolutely bare of projections, and no rope could be of service for descent. The explorers, notwithstanding the stones, pebbles, and landslides, managed to crawl down the slope till they reached the bottom of the crater, bruised and exhausted.

Although nearly suffocated by the exhalations of sulphur, the two men crawled over the bottom of the crater, which measures one thousand five hundred feet in diameter, bravely took photographs, made observations, and collected salts and minerals, meanwhile experiencing a frightfully high temperature.

At the bottom of the crater there are little hills and valleys, all irregular, and not discernible from the top. At about 2 P.M. the daring adventurers commenced the ascent. It was a hard struggle all the way up, owing to the many natural difficulties to be surmounted; but finally, at four o'clock in the afternoon, they reached the mouth of the crater.

Thus another great achievement has been performed successfully in the interest of science by the courage of this heroic scientist. At last the interior of a volcanic crater has been revealed for the study of the geologist.

AT EVENING: A SONNET.

I ROAMED at evening o'er the lonely shore,
And passed long time in gazing through the
night;

I watched the moon from its imperial height
Gleam on the waves that, restless as of yore,
Did rise and sink upon the ocean floor;

While drifting clouds ofttimes obscured the light,
Save where one golden arc of moonlight bright
Did on the weltering deep its radiance pour.

I listened to the murmurs of the tides
Sending their mystic sorrows o'er to me
In tones so deep-drawn and so wondrous clear

That, musing there a while, I seemed to hear
The all-surpassing secret of the sea,
Whose distant moaning still with me abides.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THERE is a picture in my mind which will never be effaced. A splendid figure of a man, with strong features and steel-blue eyes with a curious glint in them, was standing at the top of a stone staircase attached to some offices in Victoria Street, London, and I was descending the steps, and turned round for a last sight of him, for he was just about to depart on a very far journey. He held up his hand and called out cheerily, 'Good-bye! And mind you come to meet me when I return!' He will not return. It was Captain Robert Falcon Scott. I knew him well, and had the privilege of his friendship for many years—before the time when he set out upon the organisation of his first Antarctic expedition in the *Discovery*. He had a rather cold exterior and was somewhat difficult to 'get at'; but those who knew him well found that he had a most lovable disposition and was a very staunch and loyal friend, and he represented the very highest type of the British 'officer and gentleman.' Sir Clements Markham was chiefly responsible for bringing him forward for exploration work in the first place. That was when the scheme of the British National Antarctic Expedition, which resulted in the voyage of the *Discovery*, was first entered upon; and it is some testimony to the discernment of the man who first produced this scheme—an old explorer himself—that he brought off from H.M.S. *Majestic* for the leadership of the enterprise one who was certainly the finest man in the kingdom for the purpose and was full of enthusiasm for it. It was always the earnest desire of Scott, as an officer of the navy, to impart the very best traditions of the navy to his exploration work; and not the traditions only, but the methods. On the occasion of his first expedition his ship flew the blue ensign, sailing under Admiralty auspices, and everything aboard the *Discovery* was conducted just as if she were a little battleship. The second and fatal expedition could not set forth with quite the same dignity, but for all that Captain Scott imparted to it as much of the navy system as was practicable, and that was much. The Admiralty gave him all the assistance that they could. Being thus so strongly imbued with the spirit of the service,

he had a dignity and a reserve which were splendid, but which in these modern times are sometimes regarded by materialistic persons as somewhat expensive. He had the most intense dislike to the publication of personal details about himself, and he told me once that he could not bring himself to be the showman explorer even though he knew it might be of advantage to himself and his work. Money was needed for his first expedition, and it was more needed for the second; and though he simply could not advertise, he was brought to realise on the latter occasion that he must approach the public more intimately than had been done before. But he always confined his speeches to his work and the prospects thereof, and you never found him relating any of the tales of his youth or telling of early dreams that he might some day emulate in some measure the achievements of other polar heroes. On the occasion of my last interview with him, which was just on the eve of his departure from England, he expressed some disappointment at the response of the public to the appeal that had been made for funds. He feared that the quest of the South Pole had not captured their imagination in the same way as that of the North Pole had, and that only what might be called the sporting side of the expedition interested the people to any extent. They were more willing to subscribe to football than to such enterprises as this, which might do so much honour to the British flag.

* * *

I saw him constantly during his last days in England, and frequently discussed with him his plans and hopes. He firmly believed that he would reach the Pole this time, and seemed sometimes in some sort of way to suggest that he would not care to return unless he did. In those last days he displayed to the full his abounding energy and his wonderful powers of organisation. His staff were devoted to him, and with them he organised the *Terra Nova* expedition in a magnificent way. After he had gone away, and just before his ship sailed off from New Zealand for the frozen south, he wrote me a final letter, in which he said he felt that all the circumstances and conditions were perfect for his purpose, and that he felt that, with good fortune attending him, the great object would be

[All Rights Reserved.]

MARCH 29, 1913.

achieved. It was; but now he and his companions lie dead on those frozen Antarctic wastes. And though they have been printed so often already, it may be permitted to repeat the last words that he wrote when he knew the end was fast coming on: 'We are weak, writing is difficult, but for my own sake I do not regret this journey, which has shown that Englishmen can endure hardships, help one another, and meet death with as great fortitude as ever in the past. We took risks; we know we took them. Things have come out against us, and therefore we have no cause for complaint, but bow to the will of Providence, determined still to do our best to the last. But if we have been willing to give our lives in this enterprise, it is for the honour of our country. I appeal to our countrymen to see that those who depend on us are properly cared for. Had we lived, I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the heart of every Englishman. These rough notes and our dead bodies must tell the tale; but surely a great, rich country like ours will see that those who are dependant on us are properly provided for.'

* * *

He was a Devonshire man, born at Outlands, on the edge of Devonport, in 1868, and he lived there until he was thirteen, when he was sent to Fareham, in Hampshire, to finish his education, entering the Royal Navy immediately afterwards. He specialised in torpedo work, and after being torpedo lieutenant on the *Majestic* and then commander, was recommended to Sir Clements Markham for the command of the *Discovery*, which he assumed in June 1901. Sir Ernest Shackleton, who has since achieved so much distinction for his exploration work in the Antarctic, was one of Commander Scott's chosen officers. It seems but yesterday that I saw him giving his orders on the deck of the *Discovery* as she lay in the London dock ready to sail—he was an iron disciplinarian and had all the manner of a great commander—but it will be twelve years next August since he started out on his first expedition. The ship had a very difficult voyage after she left New Zealand for farther south; but the party landed on the Antarctic continent in January of the following year. In the same way, the sledge journeys, which began as soon as the conditions were sufficiently favourable, were the first that ever accomplished anything practical in those desolate regions. Everything was unknown, and the expedition went out to survey, to prospect, to penetrate as far as it could, and to do what was possible, with its splendid equipment, for the cause of science and knowledge. When November came Commander Scott and two of his staff, one of whom was Shackleton, got out the sledges and forced themselves towards the South Pole. They had an eventful, a terrible journey. They pushed forward continuously for nearly two months, and

were then three hundred and eighty miles from their base. They were encamped upon a vast, icy plain. The way southwards was clear; on their right were huge mountains. There was nothing to impede their farther advance; but their food-supplies were running low and their team of dogs was much depleted, some having been lost, while the others were giving way through the extra labour that was being forced upon them. Advance, therefore, was out of the question, and a hurried retreat had to be made towards the depôts of food and fuel which had been established on the way out. That return journey was a very perilous thing. The little party encountered some of the worst Antarctic blizzards, just of the kind, as it would seem, that finally checked the career of the great leader. Captain Scott's book, *The Voyage of the 'Discovery'*, in which he tells the story of this expedition, is to my mind the most intensely interesting book of travel that has ever been written. Other works may contain accounts of doings equally thrilling or more so, and of achievements of greater importance to the world; but in none do I find such a human simplicity, intimacy, and plain confidence as in this. It is like the private diary of a man's own thoughts set down in full, as indeed it is, and it gains much from being written largely in the present tense. In this book he gave an account of the party's experiences during one of the blizzards. 'The air,' he wrote, 'is thick with driving snow-crystals. They lash at our face like a sand-blast. It is impossible to face them directly, and we rush to and fro with averted head. So thick is the air that we can scarcely see the sledges. . . . It is each party now for itself with a vengeance. One of our three hangs on like grim death to the tent-pole, while the others bear the fluttering, straining canvas to the windward and try to envelop him. . . . It is a long and difficult job, this, to set up a tent in a heavy wind, while the snow curls and bites into our faces, and creeps into our mits, and into every hole and crevice it can find. . . . None of us but is keenly frost-bitten about the face, while one has two of his fingers white to the knuckles.' After many more terrible adventures the party reached the ship in safety, and there were such rejoicings then as the Antarctic had never known before. I remember Captain Scott (he had become captain in 1904) telling me once, when I asked him what experiences stood out strongest in his memory, that that 'home-coming,' at all events, was very likely the most exhilarating.

* * *

When the Antarctic summer came again, he made up a party of twelve, and they went out with the dogs and sledges to explore the country beyond the mountains of Victoria Land, which proved to be a plain and somewhat featureless expanse of snow and ice. Nearly a thousand miles were travelled, and a height

of nine thousand feet above the level of the sea was reached. It became evident that it was impossible for such a large party, with varying degrees of endurance, to make the best possible progress, and so the leader selected two of his toughest, strongest sailors, Evans and Lashly, and with them determined to make a quick final dash. One of the most exciting adventures of the expedition ensued. The sledge was being dragged along, when suddenly, and not knowing it, they reached a crevasse in the glacier, a thin layer of snow just covering up an appalling chasm hundreds of feet deep. The leader and Evans fell through the snow into the crevasse; but they were fortunately roped up to Lashly, who had held back just in time, and now managed to hold his ground, while the sledge held firm also. If Lashly had gone forward another step there would have been no more heard of that gallant little band. Scott was hanging on to the end of the rope, and Evans was hanging on above him, and they were four or five yards from the surface. As it happened, there was a ledge of ice projecting from the side of the glacier, and Scott swung himself to it, and then pulled Evans to it also. But here was a predicament of adventure which is not to be surpassed in any records—these two men in these cold, icy regions, where man had never been before, standing on a little ledge of ice deep down in a crevasse, only the rope between them and their solitary companion on the surface, and their hands and fingers so numb with cold as to make climbing—the only way out of their jeopardy—a more than usually dangerous undertaking. However, it had to be attempted, and Scott, being the lighter man, went first, and succeeded in reaching the surface. Then the two men on the top lowered the rope to Evans, a burly man, and together they pulled him up. Thrilling beyond description as was this incident, the little party seemed to take it very much as being in the day's work. They looked at one another in silence for a minute or two after the rescue had been completed, and then Evans said, 'Well, I'm blown!'

* * *

Never was the modesty of greatness better exemplified than on the commander's return from this eventful expedition. When his ship reached London he did not hurry from her into the city and to his friends, where honour and welcome were awaiting him. He stayed with all his officers and men in the *Discovery* until the following day; and it was in a rough wooden shed alongside, used for storage purposes, that he received his official welcome home. His first words in response were about his happiness in the honour that King Edward had done him in inviting him to Balmoral, and of what he called the ample reward of the Admiralty in promoting him. And then he declared that the success that had been achieved was not by any means

due to himself alone. It was due to the officers and crew as a unit. A Polar expedition such as they had accomplished, he said, was not a one-man show or a ten-men show, but was one which needed the co-operation of every man who sailed with the expedition, and every man had an equal part in its success. Of course, this expedition reached 'farthest south,' and all the honours of the Antarctic belonged to him and the men of the *Discovery*. Whether he would have made any further attempt to reach the Pole itself if his own record had not been beaten I do not know. He had come to a very full realisation of the enormous difficulties of any such enterprise, and knew also that it would be very hard to get the money together for it. I saw him once or twice during the following months; and when I asked him if he had any thoughts of another voyage, he shook his head and said he was not thinking of such a thing just then. But when Sir Ernest Shackleton took the 'farthest south' record to himself he became restive, and all the more as it began to seem that to reach the Pole itself was within the region of practical exploration. It was only a very little while afterwards that his mind was made up; he would make another attempt. In the meantime the *Discovery* had been sold; he had gone into the service of the Admiralty, and he had married. His wife—a lady of the heroic mould—encouraged him to go forward to the new enterprise for his own honour and distinction; and, some money being quickly collected, the *Terra Nova*, an old whaling-ship, was purchased, and, after being pulled to pieces and adapted, was regarded as the best possible substitute for such an ideal exploration-ship as the *Discovery*—which, by the way, did not turn out to be quite so 'ideal' as was expected.

* * *

The efforts that Captain Scott made to render the appurtenances and equipment of his expedition as perfect as possible are known only to a few. One day when I would go to find him I would be told that he was in Norway concerning a matter of dogs and sledges; another time he would be in Germany conferring with some one who had useful knowledge. He came to the conclusion that motor traction might be most advantageously employed on the snow plains that led to the Pole, and therefore motor engineers were interviewed and orders were given for a special type of machine for use in these most exceptional conditions. For a little while he gave serious consideration to the question of taking aeroplanes with him. A firm of manufacturers offered to equip him with them; but after some consideration he refused the offer. He did not think they were practicable. How far they would be so even now in Antarctic conditions is a question for an expert and not a layman to discuss; but it will be remembered that when this expedition set out, the science of

aviation was far less advanced than it is now. However, I spoke to him once upon the subject, and I am sure that even if aeroplanes in the Antarctic had been practicable, he would very much have disliked the idea of using them; and though he felt obliged to take the motors (which, by the way, failed), he was not fascinated with them. In the matter of exploration, tradition and a certain good conservatism were strong in him, and I think he felt that he would like to reach the Pole, if at all, in much the same way as the great sailors had done their big work of discovery in the past, by what might be called more or less natural means. It must have been a terrible disappointment to him when, on

reaching the goal of his ambition, the Pole itself, he found there the records of Captain Amundsen, who had forestalled him. But of this there is nothing in his last message, nor of the sadly greater and more terrible disappointment that faced him as he penned it—no repining or useless regrets. After all, he had accomplished the task he had set himself to do; he was the first Briton to penetrate thus far to the southern heart of things, and his name and fame will live for ever. I have found it difficult to write these few disjointed memorial notes just as the news of the disaster reaches me. His was a noble spirit. He was a great man. In her anguish Britain can still rejoice.

ATLANTIC GOLD.

CHAPTER VI.

HELMSDALE was inclined to be silent during lunch, eating little and drinking nothing, and immediately after the conclusion of the meal he excused himself on the plea of much work. To his niece he said, 'I have shown Mr Arcus something of our island according to man; perhaps you will show him it according to nature, Florence.'

'Your stoutest boots, Mr Arcus,' he warned the young man. 'It is a scramble, not a stroll, you are going to have.'

The island, as he was to learn presently, was a mile long by a quarter of a mile at its broadest. From behind the house it rose in rude terraces, and terminated in a sheer cliff near five hundred feet in height. Here and there patches of rank grass existed, but most of the going was over rock of the harshest.

Conversation was scant and spasmodic by the way, and when the verge of the precipice was reached there ensued a long silence—perhaps for breathing's, perhaps for beauty's sake. Beneath them in all its glory the Atlantic stretched southward and westward. Midway between these points of the compass, forty miles distant, tiny St Kilda and Boreray rose cloud-capped from the sea, solitary brown dots in a blue desert. The air was utterly still, the swell almost imperceptible; though a murmur of water, incessant, soothing, drifted up from the base of the cliff. Gulls cried in their abrupt, unpleasing tones; a small gray bird hopped about aimlessly among the broken boulders with intermittent, shrill remarks.

Under a great horn of rock, a shelter from the north and east, a garden-seat of the least uncomfortable sort had been placed. Turning toward it, the girl broke the silence.

'I call this the Woman's Cliff. When they were levelling the rock for this seat they found in a cranny a circle of metal. It was black and crusted. Hubert happened to be at hand, and prevented the workmen from throwing it away. When Uncle Victor got it cleaned he discovered

that it was made of silver inlaid with gold. The work was rough, yet it had beauty. It was Norwegian work done hundreds of years ago. You know the Norwegians once held the Hebrides?'

'Yes,' said Arcus. Seating himself beside her, he noticed her face had grown sad. 'So my Norwegian friend at the whaling station told me.'

'Every time I come here,' she went on, 'which is every day that is not too stormy, I think of the Norwegian woman who owned the bangle. It is too small for a man's. I wonder what she was doing on the island, why she came to the cliff, how she lost her bangle, whether she was young or old, and—if she died on the island! I wonder, too—foolishly, I suppose—if there is a resemblance between her and myself! My great-grandfather came from Norway. . . . I think of that woman waiting here for something to happen, climbing yon rock, perhaps, to look for sails in the north or east.'

'You feel that she was unhappy, Miss Helmsdale? Yes, your name has a Norwegian sound.'

'I think my grandfather added the "e." I can't give any good reason for imagining the woman as unhappy; but that is how I see her. Sometimes I fancy her throwing the bangle away in despair or disgust.'

'Do you imagine her all alone here?'

'No; there may have been others—of course there must have been. When our house was being put up, the fragments of a sword, also Norwegian, were found. But nothing else has been discovered. . . . A man's sword and a woman's bangle! She sighed.

'Ah,' said Arcus, 'the sword gives me a more cheerful vision than yours, Miss Helmsdale! I see the owner of it and the owner of the bangle sitting here on a fine September afternoon, admiring the view, perfectly happy and pleased with everything.'

She laughed. 'The owner of the sword smoking a cigarette, no doubt!'

'Kindly supplied by the owner of the bangle, who had been good enough not to resent his unannounced arrival in the front half of a motor-boats!'

Her colour deepened a shade. 'I will try to pardon your flippancy, Mr Arcus, if you can offer a satisfactory theory for the loss of the bangle.'

Arcus lit one of his host's exquisite Egyptians. 'To a certain point,' he began solemnly, 'my theory agrees with yours, Miss Helmsdale. In my opinion the lady did throw it away in disgust. It had been given to her by A., let us call him, a most objectionable person, but in high favour with her parents. One afternoon, when she was sitting with him here, and wishing him at St Kilda, B., a nobler character in every respect, came upon them, and without any fuss ran his sword through A.—in those days, according to the sagas, it was quite etiquette to do it behind a man's back—and sent him over the cliffs to feed the crabs. He then seated himself beside the delighted lady and begged her acceptance of a new and finer bangle; whereupon she declared she had always loathed the sight of A.'s gift, tore it off, and cast it after A.'

'But it was found in a cranny, just here!' said the girl, amused.

'Well, she aimed for the sea. And she and B. lived happily ever after. And it was B.'s sword that was found at the building of your house. Will that do, Miss Helmsdale?'

'Too well, Mr Arcus! You have killed my romance of Laskeir. I can never write it now.'

'Write it! Good heavens! do you write?' cried the young man. 'What rot have I been talking! You were writing that morning I arrived!'

'Trying to put my theory of the bangle into words,' she said a little ruefully. 'You see, I must do something with myself on the island. But I need not have mentioned it. I talk too much. I suppose it is because I've been so long without any one to talk to.'

'It's tremendously interesting!' he protested. 'And the island should make the scene of a real fine romance. Have you written much of it?'

'A good deal,' she answered, with reserve in her tone; 'but only for my own amusement. My uncle knows nothing about it, so please don't mention it to him.'

'But, I say, Miss Helmsdale, I happen to know a publisher in London. If you like, I'll—'

'Oh dear, no! I have not taken myself so seriously as all that. I'm only a beginner. Let us talk of something else.'

'As you will. But'—He halted, looking uncomfortable.

She perceived his thought. 'Don't think I resent your making fun of my melancholy ideas of the Norwegian woman,' she said kindly. 'I don't mind, really. Only, I doubt whether your bright theory of A. and B. would have come to you if you had sat here alone for a goodly portion of three years.'

'I'm a blundering fool!' thought Arcus; and he said, 'Then I shouldn't have had any ideas or theories at all, Miss Helmsdale. My only excuse for talking like an unsympathetic ass is that there is nothing about you to remind me of your secluded existence.'

'Isn't there?' She shook her head. 'I get the newest books and magazines, and, I believe, quite modern clothes. I read of the world's doings. But there I stop. I haven't spoken with a woman for two years. When we came here I brought a maid with me. She stood it bravely for twelve months, poor thing! Before we came here we lived chiefly on the Continent—Paris, Brussels, Vienna, and so on. You can imagine the change. And yet I love Laskeir.'

'Does not Dr Helmsdale think you ought to have a change of scene now and then?' Arcus ventured.

'He used to suggest a trip in the yacht or a visit to friends. I have few friends, because, you see, we were always moving about on the Continent. But I discouraged him, and now he does not speak of a change before his work here is complete.' Her eyes met his. 'Did he not tell you in the laboratory that there were risks in his work?'

Arcus assented. 'He mentioned a risk in his marvellous colour-photography process.'

'Then you will understand that I could not leave the island without him. Since I left school he has done everything for me. And please don't assume that I'm discontented here. On the other hand, don't expect much gaiety from me. The sea is always full of wonder, but it is not a merry companion.' Her eyes turned to the Atlantic, possibly from force of habit.

Arcus watched her profile, and in his heart something seemed to stir. He checked a platitude at his lips. It would be absurd to tell this girl that she was acting nobly, that her reward would surely come, and so forth.

'I wonder,' he said at last, 'how you will feel—what you will want to do first—when the time arrives for you to leave the island.'

She smiled faintly. 'Probably I shall feel broken-hearted and want to stay. Then, once on board the yacht'—She waved her hand and laughed. 'Theatres, concerts, dances,' she went on soberly. 'I wonder if I shall enjoy them as I used to do! Going back to them three years older and thirty times wiser, with all the strange lonesomeness and mystery of Laskeir clinging to me, as I know it will cling, I wonder—oh Mr Arcus, I wonder!'

He answered, the least thing impatiently, 'My dear Miss Helmsdale, you exaggerate the effect of your three years on the island. You will go back to the world as if you had never left it. Why, you are just a girl, and when the time comes you'll dance like a girl, and'—

'I cannot imagine myself waiting again,' she said, glancing at her serviceable boots.

'I can imagine you,' he rejoined, thinking of the pretty slippers under the couch in his room; 'and I'd give a good deal to be there to ask you for a dance.'

'Would you?' she said absently.

'I would come round the world to be there!' He spoke more warmly than he intended, more eagerly than he was aware.

'Are men so gallant nowadays?' she lightly asked, though for the second time in ten minutes her colour deepened. 'Round the world! I haven't heard anything like that for three years, Mr Arcus. It only wants a conservatory and faint music, doesn't it?'

'It only wants a little belief on your part,' he retorted, somewhat nettled, he could not have told why. 'Bid me come round the world!'

She turned to him rather quickly, but with a charming smile. 'You mean a very large belief! Nay, Mr Arcus, this is a place for sheer honesty, if ever there was one. You do not know how soon a ship may come in sight, and you cease to be a prisoner. As soon as you are on board you will begin to change your mind about many things. The romance of this little island will fade even as the island itself fades. You will remember only your unlucky accident. The rest you will forget, as I shall forget.' Her eyes went back to the sea.

'Forget!' he exclaimed. 'As long as I live'—

She held up the watch on her wrist. 'It is exactly thirty-six hours since you arrived here, Mr Arcus. No, please don't say it seems like thirty-six weeks; and it is also tea-time.' She rose.

He followed, a trifle sullenly. 'Can't we be friends, Miss Helmsdale?'

'Friends! Don't be rash, Mr Arcus. It's a very big world, after all.'

They went a while in silence.

At a difficult part of the descent he proffered his hand.

'Thank you! But the way is strange to you and familiar to me. Pray be careful!' she said.

Eventually, puzzled and vexed, he followed her into the house.

Dr Helmsdale did not join them at tea; he was busy in the laboratory. Against his inclination, Arcus was induced to talk about himself and his travels. Later, left to himself, he took up a book, but could not settle to it, and went out of doors.

On the beach he examined the remains of his boat, lit a cigarette, and seated himself on a boulder. The sun still shone, but he was in the shadow of the rocky wall. He was spiritually chilled and gloomy.

Had he offended her? Hardly that. She had not ceased to be kindly and frank. Yet suddenly the sensitive, impulsive girl had become a cool-spoken, self-possessed woman. What had he said or done to bring about the change? He

worried himself over the problem until, in the gathering darkness, Hubert came to announce dinner. It did not occur to Arcus, however, to ask himself just why he worried.

Hubert duly served the green liqueur in the golden cups.

'He has allowed the temperature to rise a degree or two,' the doctor remarked with a critical smack of his lips. 'What do you think of my niece's work on the cups, Mr Arcus?'

'I am as unworthy to criticise as to touch it,' the young man replied.

The other gave his gratified schoolboy grin. 'Very pretty, indeed! Almost as pretty as the cups—eh, Florence?'

Indeed the cups were beautiful, shaped like tulips, with stems that one hesitated to grasp.

'Thanks, both of you,' said Florence, lightly, from the piano. Her uncle had commanded soft music of strictly unclassical form. She began to play sentimental bits from the latest musical comedies.

'Oblige me with your card, will you?' said the host quietly to his guest.

An odd request just then; but Arcus concealed his surprise, and took out his cigarette-case, which had a compartment for cards. He handed one to Helmsdale, who said very pleasantly, 'I will send you a cup at Christmas to drink our lonely healths in, Arcus. My niece shall design a new decoration.' He waved away his guest's protestations, and glanced at the card ere conveying it to his vest-pocket.

The doctor's mouth opened; his eyes stared; his body twitched; and then for a moment he sat as one stricken with palsy. The card slipped from his fingers.

'Are you ill, Dr Helmsdale?'

The other recovered. 'No, no! Sh!' he whispered, with a warning glance in the pianist's direction.

Arcus looked down at the card, which lay face up on the rug. 'I beg your pardon,' he said, 'I've given you the wrong card. An exchange with a man I met in the hotel at Portree. Stupid of me!'

'Ah!' It was like a breath of relief.

Arcus picked up the card and proffered one of his own, wondering.

Helmsdale smiled as he took it. 'I confess you gave me a shock, Arcus. That other card bears the name of a—an old friend, a dear old friend, who—who died in peculiarly painful circumstances. It is not a common name—Jonathan Barge—and somehow'—He broke off and raised the last of his liqueur to his lips.

'I'm exceedingly sorry!' Arcus murmured, feeling awkward. 'No, Jonathan Barge is not a common name.'

'A chance acquaintance—a passing acquaintance, I suppose?' said Helmsdale in his natural voice, if not altogether in his natural manner.

'I met him at dinner and in the smoke-room afterwards. He was interested in my trip. Oddly enough, he spoke of your island—vaguely, I must say.'

'Vaguely! Quite so. A tourist?'

'He had been fishing in Harris, and was on his way home to London.'

'London! I see.' There was a pause while Helmsdale took a cigarette. 'Living here,' he resumed, 'is apt to make a man believe in ghosts. Was your chance acquaintance anything like this?' He described a man in no respects resembling the Jonathan Barge of the Royal Hotel, Portree. 'Not in the least like him, Arcus, eh? Ah, well, that is my ghost laid!' He laughed softly, apologetically, and fell silent.

When he rose to return to the laboratory he said to Florence, 'We must take Mr Arcus to the Other Island soon—as soon as I get through my present task. Don't expect to see me again to-night.' He kissed her cheek lightly, nodded to Arcus, and passed into his sanctum.

For another half-hour the girl remained at the

piano, playing in desultory fashion; then she rose rather abruptly, complaining of feeling tired, and bade Arcus good-night.

After a couple of cigarettes smoked in idleness, the young man betook himself to his room. Possibly he was suffering from a perfectly natural physical and mental reaction; yet that was scarcely a sound reason for his becoming utterly depressed on noticing that a pair of pretty slippers with 'Louis' heels no longer rested under the couch. He was slow in making the harbour of sleep that night.

Florence, too, was restless. In the darkness, open-eyed, she beheld in a vision a woman of old Norway seated on a cliff, gazing over a vacant sea, turning a bangle on her wrist.

'You fool,' said Florence to her heart, 'if you should let that happen to you!'

And in the laboratory, flooded with yellow light, a mask of glass over his lean, leathery face and bright hazel eyes, Dr Helmsdale wrought eagerly at his task.

(To be continued on page 280.)

WATER AND METAL DIVINING.

By Lieutenant-Colonel HUGH ROSE.

IN view of the fact that a great demonstration of this peculiar gift is to take place in London at the beginning of April, it may interest readers of the *Journal* to learn something beforehand concerning its mysteries from one who happens to possess in perhaps a somewhat unusual degree the power of readily 'sensing' both water and metals.

Up to the present time comparatively few of the public seem to be aware that such a power exists. Professors, scientists, and others who have never witnessed a demonstration appear to regard it, as a rule, as brought about bylegerdemain and trickery; but the bald truth remains that it is nothing of the sort. 'Seeing is believing;' and I have had the pleasure of convincing many sceptics that there is no fraud at all about this divination, or 'dowsing,' as it is sometimes termed. For many years diviners have been doing good work in various parts of the globe in the discovery of metals, water, and oil. One firm, Messrs Mullins & Sons, have been water-finding with the greatest success all over the kingdom for more than forty-five years.

It is possible that the following remarks may give some scientist a clue as to the cause of the phenomena which accompany water and metal divining, which so far has never been satisfactorily explained. Up till the summer of 1903 I had not even heard of its existence, which became known to me in a curious manner. While out in a large camp of exercise at Stobs, in the Border country, I came across a partridge's nest with sixteen eggs in it. Thinking that the

troops might trample on it or remove the eggs, I went to the keeper on the estate, and advised him to take them away and put them under a hen. The keeper, grateful for the information, at once said, 'If you will allow me, sir, I will come up to the camp to-morrow, and show you how to divine water and iron.' On the following afternoon he gave me my first object-lesson in the way of dowsing; but, to his great disappointment, I was totally unable to 'sense' water at all with his twig, and could only feel a scarcely appreciable symptom of a pull when I held the twig over a wire fence. Two or three subsequent trials proved equally unsatisfactory. I am inclined to think that the reason for this was that my vitality must have been impaired at that time by recent campaigning in South Africa. Two or three years later, while staying in Fife, I cut one day a hawthorn-twigs, and tried, along with a friend who possessed the power in slight measure, to find water for a farmer who was short of that commodity. Working independently, we both hit upon a line of water running across the field. It turned out to be a brick-tile drain; and though of no use as a source of supply to the farmer, it proved to me that I had at length acquired in some degree the gift of finding water.

My next essay was in the summer of 1910, in Ireland, during a prolonged drought, when I went down from Limerick, by request, to Lahinch golf-course to try to find water for the putting-greens there. The green-keeper, who hailed from Aberdeen, was most sceptical, but said he would

believe in dowsing if my twig could locate an old underground conduit leading from a well to an old ruined castle, once a stronghold of the O'Briens. I quickly struck the line close to the castle, ran it for some three hundred and fifty yards down to an estuary, and there correctly located the well, though it was quite concealed under twelve feet of sand. Casting round, I happened to hit upon a second hidden well, and showed the man where the two joined the old conduit. This satisfied him, as he had seen both wells exposed before sand had silted up over them.

Subsequently I pointed out to him places where he would get water at a depth of about eight feet near every putting-green but one, which was perched on the top of a high sandy eminence.

I used in those days to hold the twig in front of me, fingers uppermost; but on one occasion, while travelling fast over a field, I was struck a severe blow on the mouth by the tail of the rod on passing suddenly over a hidden spring. Since then I have, when seeking water, held the fingers down, with the tail of the rod resting hard up against the under side of my forearm. If the fork is splayed in this manner and the thumbs are lapped over the forefingers, it is impossible to turn the stick one's self. Only water or fluids can pull its tail down.

During 1911 I kept on improving as a water-finder, and not only located the site of a source which supplied the water for the camp of our brigade at Lisnagar, near Fermoy, but won a bet with regard to the finding of water at a depth of under twenty feet in a most unlikely spot close to our mess tent. The Royal Engineers sank a Norton tube, and came on water at fifteen feet. I make no pretensions, however, to estimating depths at which water will be found, or the probable quantity in gallons per hour. Some diviners can foretell these with marvellous accuracy, as the result of long practice and much experience.

I have seen it stated that the twig only turns to running water, but such is not the case. With me it will revolve to a wine-glassful of water on the floor at a horizontal distance of three feet or more.

In 1912 I found that my rod was especially sensitive to gold, but turned, though less readily, to other metals, with the exception of silver. Why silver has on me no effect whatsoever seems most strange and inexplicable. Last December a gentleman in Worcestershire asked me to try to locate a sovereign concealed by him in a large room in which we were sitting, and I very soon 'sensed' it correctly under a fur rug on a sofa. While I was working it round one side of the room my hazel turned to a small wooden model of a ship with apparently no metal at all about her. Thinking the rod might have jumped through careless handling, I tried again, and with the same result. On my expressing surprise, my host laughed and said,

'That is a collecting money-box, and probably there are several coppers in it'; which proved to be the case. The hazel must have smelt, as it were, the coppers through a small slit in the ship's deck, as even gold inside a shut wooden box has no effect at all; and at that time what may be called the 'affinity' method, by which the action of wood, paper, and water can be negated, was unknown to me. This system consists in 'sensing' an object by holding a similar object in one's hand in contact with the rod, the latter being in a state of tension.

I should first of all explain that water and oil make the splayed stick turn in the same way as the hands of a clock, while metals turn it in the reverse direction—that is to say, that when the tail of the rod is lying under one's forearm, it will move forward and upward when water is approached. When 'sensing' metals I generally let the tail lie back against my chest. The pull of a metal will then draw it forward and downward. When doubtful as to whether metal or water is going to affect it I hold it horizontally, the tail about the level of one's waist on the left side.

There is an erroneous idea prevalent among some that the twig must be of hazel; others believe that willow is the only wood that turns; but the writer has worked with all sorts of mediums—hazel, willow, ash, hawthorn, blackthorn, beech, rhododendron, bamboo-cane, and whalebone. The last-named, when two thick and rounded pieces are lashed together at the bottom, makes a nice, easy rod to handle, far less tiring and less liable to fracture than wood.

The 'affinity' method mentioned above was the result of a casual remark of a friend who had just seen a demonstration for the first time. He propounded the query, 'Can you find coal?' 'No,' said I; but, on reflection, I added that some one had told me that by holding a piece of coal in one's hand, the stick would in some cases turn to another piece of coal. He suggested that I should try the experiment at once; and, sure enough, the twig turned down to a lump of coal on the floor. He then suggested ordinary golf-balls, and I held the rod horizontally. It turned metal-wise to the ball on the floor. Two water-cored balls were then produced, and, to our astonishment, it turned as for water. We never dreamt that water could, through the rubber casing, affect the rod in any way. These experiments were repeated several times with the same results.

A sovereign was then dropped into a large tumbler of water. On my approaching in the ordinary way, the rod indicated water; but when a sovereign or gold chain was held in my hand the water was negated, and the rod turned to the gold. A sovereign was then placed under a newspaper. Paper, being a non-conductor, seems to cut off all connection with gold or water when approached in the ordinary

manner; but when gold is held in the hand the paper is entirely defeated, and the twig turns at from two to three feet distance. I can now 'sense' a sovereign lying on the floor by this method at twelve feet horizontal distance.

The last experiment tried was perhaps the most interesting of all. A very small box of Swedish paraffin matches was placed open on the ground. One end of the rod was inserted among the heads of similar matches in another box, and tension was applied. At the usual distance the rod twisted violently as for water. It seems incredible that a few dry oil-match heads can so affect the twig, but the fact remains that they do so.

Other objects which I have 'sensed' by affinity are cigars, tortoise-shell and ivory objects, and diamonds. To an orange the twig reacts water-wise, doubtless owing to the quantity of fluid it contains.

Operating the rod seems to affect diviners in various ways. Some experience a sensation in their fingers or arms, some become exhausted, and others are affected by nausea. Diviners of the fair sex are apt to become hysterical if they practise too much. Personally I have so far felt no particular sensation or inconvenience. No mental exertion seems necessary. While traversing a field the operator can be thinking of or talking about some totally different subject.

According to Professor Barrett, F.R.S. of Dublin, who has gone most deeply into the subject, the first mention of divining that he can trace dates back to about 1480. The commonly accepted theory regarding the turning of the twig is that of 'unconscious muscular action' on the part of the diviner, the idea being that to find water an operator must start out with that

intention if he is to be successful. I venture to doubt this theory for the following reasons, and am inclined to attribute it to what I call 'human electricity.' On two occasions while searching for water I have suddenly felt the tail of the rod pressing hard against my forearm as the result of my passing over metal—in both cases iron. In the already-mentioned case of the water-cored balls, I fully expected that if the rod turned at all, it would be in the contrary direction to that in which it actually did.

Not long ago I was tracing out the run of an old, disused coal-mine with a piece of coal in my hand, when suddenly the rod flew to water, with which the mine at that spot was no doubt flooded. From the configuration of the ground, when one considered it, the existence of a large quantity of water below at that spot seemed highly probable. The newspaper and closed wooden-box tests also suggest some other agency. One knows perfectly well that gold is there, and yet, when 'sensing' in the ordinary way, nothing happens.

The writer almost hesitates to try the credulity of his readers further by stating that the rod can also be used for tracking human beings, but it is used for this purpose to-day in Abyssinia and elsewhere. How one sets about it he does not at present know, but it is probably merely a matter of practice and experience for a skilled diviner to acquire the art. There are many things in the world which cannot be logically explained—certain phenomena of electricity, wireless telegraphy, and so forth. It is to be hoped that the coming demonstration may tend, in the interests of science, to solve the problem of this strange and interesting question.

CORRIGAN'S REVENGE.

A TALE OF THE GANGS IN THE UNDERWORLD OF NEW YORK CITY.

By ARTHUR HUNT CHUTE.

OFFICER CORRIGAN was one of the biggest men in the New York police force. He was known as a terror with the boxing-gloves, and many a 'white hope' had been put to sleep by him in Brown's Gymnasium. The boys of the West Side never lost their wonder as they watched him on some icy winter morning dive from the pierhead and swim far out into the currents of the North River. On the athletic field of the Irish Americans he was a doughty figure in all-weight events, and, as Trainer Murphy observed, 'Take him wherever you would, he is a tough nut.'

It was for this reason that the inspector had assigned him to a post of peculiar honour as night-patrolman in the Hell's Kitchen precinct. Corrigan had been doing duty on the Broadway traffic squad; but at a time of especial trouble with the gangs he was glad

to find himself in the bloody angle of the battle.

Lefty Lewis, the leader of Hell's Kitchen Gang, was anything but happy as he watched the big policeman swing on to his new beat. That night in O'Toole's saloon he gave the boys a rare selection from his vocabulary of malediction. Lefty was a past-master in the art of swearing, but to-night he stirred the hearts of his low-browed gangsters with deeper thrills than ever. Three months of unbroken success made this formidable opposition all the more provoking. At the last election Lefty and his gang had rendered yeoman service to Tammany by knocking out numerous opposition supporters around the polls, and thus preventing many hostile votes from being cast. In return for this service they enjoyed the protection of certain authorities, and had been doing a rousing business. Never a night passed

without its hold-ups, and many an obstinate victim had gone to Bellevue with a fractured skull dealt by the gangsters' black-jacks.* But their crimes had become too great. The petty politicians could no longer protect them against an aroused public sentiment, and so at last Lefty and his gang had to fight their battles themselves.

'I reckon,' said he, 'this new cop'—that is, policeman—'will be no tenderfoot in Hell's Kitchen; an' if we don't chuck him over the Great Divide, our bunch'll get a long rest in the coolers.'

'Right-O!' said Thirsty Thorne, who had already begun to justify his name at the bar. 'Don't ask me to help ye to tackle the guy, though, for I ain't wantin' to pass my checks in for a while yet. I saw Corrigan lay out Mahoney in the first round at Madison Square Garden last week, an' I'll tell ye, Lefty, he'd take a barnyard full o' fellers like you an' me for his breakfast.'

'Ye always was a quitter,' observed Lefty; 'bin a curse to the gang. Neither a man nor a chicken is any good without sand in his gizzard. I'd like to see ye wheelin' a baby-carriage in Central Park—that's where ye belong.'

'Thanks for the compliment, Lefty. I'd sooner be in the Park than the morgue.'

'Well, let's cut out this guff,' said Lefty. 'That cop's on our beat, an' while he's there there's nothin' doin'. We might lay a couple o' gun-men on his tracks an' pink him, but that would raise too big a row. What are we goin' to do, then?'

Every one turned instinctively toward Matt Mulligan, of Chinatown, the most dreaded police-fighter in the city, who, with years of experience in the underworld from the Bowery to the Bronx, had come to give his counsel. Matt rolled a piece of honey-dew meditatively in his mouth, then shot a flood of tobacco-juice with accuracy and precision across the room at a spittoon. After indulging several times in this spectacular form of target-practice, he opened his oracular lips to speak.

'You fellers can't have any gun-man in this game wi' the cop. If ye do, the whole force'll be on yer neck. He's a game sport, though, an' perhaps ye can put the persuaders on to him. Perhaps a fiver [five dollars] a week will put him in the right place at the right time. If the persuaders don't work, then it's up to ye to put the fear o' God into him. If it comes to rough house, see that ye beat him up good an' plenty. But it's just as well if he don't kick the bucket; dead cops mean dead gangsters. Them's my sentiments.'

Next afternoon a caller at the home of Officer Corrigan was observed to shoot suddenly out of the front-door and land in a heap on the side-walk. Lefty Lewis picked himself up in a speechless

rage; even his strong vocabulary was impotent to express his feelings.

It was nearly twelve that night when Corrigan left the precinct police station and turned down Eleventh Avenue toward West Street. New York never sleeps. Her thoroughfares are throbbing night and day. But as the officer passed toward the district of ill-repute the signs of life became rare, and the few late ones did not tarry on the way. Down the grim cavern of West Street all was quiet. Only greenhorns from the country and drunks who were asking for trouble went into that street after midnight, and when they had once got in, they generally made the return trip in an ambulance. Many a step that turned that corner in the dark never echoed again in the ways of men. But there was no abatement in the swinging stride of the officer, and as his strong, sure footsteps rang against the pavement they seemed to echo 'All's well! All's well!' They flung out a challenge as they passed the green-baize door of O'Toole's saloon, whence a ray of yellow light streamed forth. Suddenly the swinging footsteps ceased to echo. 'Hello! what's this?' he exclaimed, as he was halted by a cord drawn across the road. Upon the cord was a placard which bore the sinister warning, 'Dead Line for Cops.' It only took a moment to read the inscription and to remember the afternoon visit from Lefty Lewis. Then the brave feet were echoing again as they moved swiftly on to the dark alley known as Past Redemption Point.

Corrigan was aware of what chances he was taking. None knew better than he of the deadly treachery of the gangs. His every movement was alert. His nerves were strained to catch the slightest sound. But that was the last thing he knew. A black-jack from the unerring hand of Thirsty Thorne had whizzed through the air and fallen with a dull thud on the back of his skull. In the twinkling of an eye the strapping, stalwart fighter was transformed into a heap of bleeding helplessness, and the weird howls of Lefty Lewis rent the air as he and his gang kicked the senseless body of their erstwhile enemy far out into the street.

When Corrigan came to he opened his eyes to gaze upon the walls of the emergency ward of Bellevue Hospital. He had suffered a slight concussion on the brain, but as the skull was not fractured there was no serious danger. In three weeks, with a paler face, but with as brave a spirit as ever, he was reporting again for duty before the Deputy Police Commissioner.

'I think I'll put you on Riverside Drive, or somewhere up on Easy Street, Corrigan, until you get back on your legs again.'

'Well, sir, I'm back on my legs again, and I am reporting for my old post on West Street.'

'I don't think you are fit for the guerillas yet, old man,' said the deputy.

'I'm fit enough,' answered Corrigan, 'and I'll

* A black-jack is a piece of lead attached to a leather thong. It is a staple weapon among the gangsters.

show the varmints there's no killing this Hibernian when he's on their heels.'

So Corrigan, at his own request, was sent again to his dangerous post. That night the gangsters, who lay in waiting, thought that all was well. The substitute policeman had never shown his nose over the 'dead line;' frequent fivers, together with a wholesome fear of his predecessor's fate, had strengthened his resolve to give the danger zone a wide berth, and Lefty had dreams of another triumph. Skip the Blood was guarding the alley, and the rest of the gang were lolling about in a room at the back of O'Toole's saloon.

'Guess we're into our job again all right, boys,' said Lefty, 'an' we ain't goin' to let the grass grow while Corrigan's off this beat. I heard to-day that he's got a job holdin' up Grant's Tomb at Riverside till his legs are less wobbly.'

'I hope he stays up there!' said Thirsty. 'I ain't had a sound sleep since the night I bagged him in the alley. Ye know, fellers like Corrigan generally pay their debts, an' I'd just as soon not have too big an account wi' the likes o' him.'

'I'm goin' to recommend ye for a job layin' out stiffs in Daddy Meritt's undertakin' show,' returned Lefty. 'Anythin' stronger than a corpse is too much for ye. If ye wasn't such a son o' a gun wid the black-jack I'd pitch yer sissy spine out o' my gang. There's as much difference between my class an' yourn as there is between a brown-stone front an' a peanut-stand.'

'Nothin' like havin' a good opinion o' yerself!' said Thirsty, as he took a long drink and gazed contentedly around the room. 'I know, for meself, I could lick any man in the bunch.' Whisky always raised his spirits that way; and after another generous libation he averred that he could lick any man on the West Side. Still his opinion went unchallenged, and turning his head back, he drained the bottle; and then, in his most invincible mood, announced that he could lick any man on Manhattan. At that moment Lefty landed him a hook on the jaw, and Thirsty fell in a heap on the floor. But a moment later he rose with uncertain motions, and said in a hiccuppy voice, 'I guess the trouble wi' me was I took in too much territory.'

'I guess that's what ye're always doin' in this gin-mill,' said Lefty. 'Take it from me ye're too much o' a booze-artist.'

But, despite his modest talk when sober and his blatant bragging when drunk, Thirsty Thorne was reckoned to be a tough fighter. His methods of attack were always of the sneaking kind, but there was no other method among his compeers. He would sooner have lived without fighting, but the hold-up game afforded him an easy living, and he followed the line of least resistance. Very few of his class were ever forced to join the gang. Most of them followed the game because they loved it. They were the kind that hated law and order, and were always spoiling for a fight. The blood of Attila, the Scourge of God,

flowed in their veins. They included the scum and cesspools of society which were poured into New York from the sewers of continental Europe. Their university of crime has been supplying America with a plethora of bomb-throwers, assassins, and cut-throats for the last fifty years. This wild, predatory group in the back of O'Toole's saloon constitutes one of the gravest problems of democracy. They follow their nefarious business in daylight as well as in darkness. Only yesterday a clerk was found dead at the noon hour in a shop near by, and his name was added to the already swollen list of 'Murder Mysteries of the City.' Already to-night, in a saloon up the street, a bar-tender has been found senseless; and again, as always, an empty cash-till and a rifled safe.

Behind O'Toole's green-baize door in the dirty back-room, Lefty Lewis was planning new raids, happy in his supposed safety. Thirsty Thorne had recovered from his upset, and was dozing; the rest of the gang were playing poker, and their frequent growls and curses made the weird din sound like that of a tiger's lair. Just outside the door a police-officer was crouching and listening intently. Skip the Blood, who was supposed to be doing scout duty, was dead to the world.

At a moment when the sounds within were more venomous than ever, the outside door moved noiselessly, and Corrigan crawled like a panther toward the inner shrine of Hell's Kitchen. O'Toole, behind his bar, heard nothing, and Lefty saw nothing inside until, with a sudden flood of shooting-stars, his memory went out in darkness. There, alone, stood the giant Corrigan, with his swinging night-stick, and at every swing somebody's bones answered with a crack.

'I'll show ye who's boss on this beat!' he roared, as he drove the frantic gangsters before him like sheep. 'Take that fer yer kindness to me,' he said, as he kicked the nearest man through the door and rounded up the rest in the same direction. 'Get out o' here wid ye now;' and none seemed loath to obey his order. There was a wild stampede to escape, and its impetus was immensely accelerated by the incessant crack of the night-stick and the lifting power of a big foot. By the time the side-walk was reached four of the gangsters were lying senseless on the floor of the saloon, and those who gained the street lost no time in making tracks. Corrigan re-entered the back-room, and was bending to handcuff the senseless Lefty, when a black-jack, by the unerring hand of Thirsty Thorne, came crashing down with the same deadly force as before.

This time the unfortunate policeman was five weeks in the hospital, and when he appeared again before the deputy he was, in spite of his protestations, appointed to an easier post up-town. As he paced up and down on the peaceful heights of Riverside Drive, breathing the clear air of the Hudson, he nursed his grudge against Lefty, and

dreamed of the day when he would be again at the place where he could get even with him. But the authorities seemed to have conspired against him; for when his old-time strength revived he was not sent to Hell's Kitchen, but was attached to the Broadway traffic squad once more. He was now well in body, but it made him sick in spirit to see his chances of revenge thus snatched away. He was always anxious to know of the doings in West Street, and it was good news to him to hear that Patrolman MacDonald had indulged in a mix-up with the gang. When he found that MacDonald, who had been making it too warm for them, had been removed to another station, it sounded more interesting than ever. After his day's work Corrigan resolved to pay his fellow-officer a visit.

MacDonald was also a mighty man of the force, and when he and Corrigan stood together that evening they looked like giants of another race.

'I heard ye was mixin' it up wi' Hell's Kitchen, Mac, an' that they give ye such a lickin' ye asked to be relieved from that precinct.'

'Ye're lyin', an' ye know it,' answered MacDonald. 'I'm only prayin' for the day when I meet them again.'

'Well, we're in the same boat, then, Mac. I just came to see if ye were game to join a little secret society that I'm goin' to organise among the boys to square accounts wi' Lefty Lewis and Co. It ain't Corrigan that lets two trips to the hospital go for nothin'.'

'Well, I'm yer man at that funeral,' said Mac; 'an' I know some more in the force like myself.'

Before a week had passed ten doughty fighters had been recruited from the strapping athletes of the traffic squad and organised into the Anti-Hell's Kitchen League, with Michael Corrigan elected as leader. They held their weekly meetings in Brown's Gymnasium. Boxing and wrestling were the main features of the programme. Frequent reports were received from their spies regarding the plans of the gang.

One day a special message came from their ally, the patrolman of West Street; and that night, long after dark, various big policemen in plain clothes were seen to slip quietly into the confines of Hell's Kitchen and disappear into sundry alleys and doorways. They came so stealthily and vanished so quickly that no one

noticed their coming. Once they were hidden, Past Redemption Point looked as lonely as ever. It was a dirty, stormy night, just the kind that Lefty Lewis loved, and he smiled as he heard the wind sweeping down the great cañon between the tall warehouses.

The whole gang were crowded into O'Toole's saloon, and Thirsty Thorne was taking a last 'bracer.' 'Where's yer cop to-night, Lefty?' he inquired.

'Oh, he'll be good an' far away; don't ye fret about that. I gave him a tenner, an' told him that if we made a good haul at Cavanagh's I'd give him five more to match it.'

A few moments later the gang filed out through a back-door and up the street for their night's business.

'Bless my stars, what luck!' exclaimed Lefty. 'Here's a guy comin' right now.'

A figure was approaching with uncertain step; but when he saw the ominous group he suddenly turned and fled up a dark alley, with Lefty Lewis at his heels, followed by the rest of the gang. The alley was long, and the quarry was swift; but, nothing daunted, the gangsters pursued him. Suddenly Lefty shot forward on the ground with a shriek, and in a moment the alley was full of fighting men, sprung up like Sons of the Earth. The gang was terrified, and turned to flee; but their retreat was cut off by the same breed of giants that opposed their advance. There was nothing left for them but to fight, and fight they did. Stones and sticks and black-jacks were whizzing in every direction. For a few moments a fierce battle was waging, but it soon became a field of defeat for the gangsters. The sneaking Thugs who fought so well from behind were no match for these strong athletes face to face.

'Here's where you an' I get square,' roared Corrigan, as he qualified Thirsty Thorne for three months in the hospital.

'Take that from me,' thundered MacDonald, dealing Lefty Lewis a rain of blows that put him for ever out of business as a gang-leader.

That night the emergency ward at Bellevue was crowded with patients who were not victims of the gangs; and next morning Corrigan was contented as he stood again amidst the roar of Broadway traffic.

THE MONTH: SCIENCE AND ARTS.

A 'SHUTTLELESS' SEWING-MACHINE.

SINCE Thomas perfected the lockstitch, the domestic sewing-machine has undergone very little development. There have been modifications and simplification of details, but many of these improvements have failed to justify their incorporation. During recent years

the vibrating, or oscillating, shuttle, carrying the bottom thread, has given way to a simple spool, but this improvement was rather of the character of a resuscitation of an old idea than a new development. But now a far more radical step forward has been made through the remarkable invention of a British inventor, Mr Denis Flanagan, who has devised a means of dispens-

ing with shuttle or bobbin for the lower thread. Instead he merely uses the reel of cotton, just as purchased from the shop, and slides it into position. Thus he offers what is practically a two-reel machine. The second reel is inserted under the bed-plate in the usual manner upon a vertical spindle, and the feed is as regular and as steady as if drawn from a shuttle-bobbin or spool. The reel may carry six hundred yards or more of thread, yet the smoothness and regularity of working are just the same. When the reel has become exhausted, all that is necessary is to withdraw the empty reel and to insert a full one, an operation which occupies barely a minute. What this means can only be appreciated by the housewife, seamstress, or worker in a large factory. Under existing conditions the bobbin or spool has to be recharged time after time during the consumption of a reel of thread, involving a considerable loss of time, the consumption of energy which might be devoted to more useful effect, and aggravation, as the feed invariably gives out at an awkward moment. But many other beneficial effects are derived from the new idea. The number of component working parts of the sewing-machine is reduced, and this means less likelihood of a break-down, as well as a reduction in the cost of manufacturing the machine. The loose balance-wheel and clutch mechanism are dispensed with entirely. The stitch is uniform, and owing to the double 'take-up' for the top thread there is elasticity in the tension, which adapts itself to all classes of stitching, so that there is no need to alter the tension for varying grades of work as at present. The stitch, too, is a positive lock because a knot is formed between each stitch. It may be mentioned that the upper thread proceeds from the reel in the usual manner. The successful exploitation of this invention should prove of far-reaching importance, as it constitutes the most pronounced development that has been effected since the sewing-machine was perfected.

THE 'AEROSCOPE' CAMERA.

A new type of camera has been placed on the market for the benefit of those interested in amateur cinematography. It is the invention of Mr. K. Proszynski, and it possesses many ingenious features. It is of the 'hand' type, so that a stand is unnecessary; while the feed of the film to the lens is done by the aid of the ubiquitous button instead of the handle being revolved as in the ordinary apparatus. The camera is held steady during the interval of exposure by means of an ingenious gyroscopic device which counteracts all movements such as might arise unconsciously from respiration. This counteracting mechanism is mounted within the camera, and is driven by means of compressed air. The result is that although the camera is held in the hand, the pictures are as steady as if taken with a stand-camera. When the button is pressed

the movement of the film continues until the supply of compressed air is exhausted, when the reservoir is recharged with a pump similar to that employed for the inflation of cycle tires. The equilibrator, as it is described, is certainly a marvellous piece of mechanism, and fulfils its designed purpose with a very marked degree of efficiency. The aeroscope camera has been subjected to searching trials, particularly by Mr. Cherry Kearton, the eminent naturalist photographer, who has accomplished some very striking work therewith. The demand for such a camera is wide among both amateur and professional cinematographers, as it offers a ready and reliable means of catching just that movement of elusive Nature which never fails to provoke astonishment.

THE AGE OF SUBSTITUTES.

A German scientific writer has been drawing attention to the extensive dependency of the present era upon substitutes. There is margarine, which is displacing dairy butter, and which is prepared so deftly as to defy detection by all but the analytical expert. Our daily paper is printed upon a substitute, wood-pulp being employed instead of rag; and now, owing to the depletion of the forests, there is strenuous search for a substitute for a substitute, as wood-pulp is becoming expensive. Cotton has entered so intimately into our complex social and industrial life that it has ceased to be regarded as a substitute, although it is such. We no longer depend upon the silkworm for silk, but obtain it by a mechanical-chemical process from cellulose; while the delicate tints imparted to our wearing and decorative fabrics are obtained by recourse to dyes extracted from tar products instead of the vegetables and inorganic substances used by the ancients. We have synthetic camphor and perfumes, while my lady no longer bedecks herself with rubies and sapphires extracted from the ground or with pearls from the oyster, but with those from the factories. The farmer no longer depends upon the refuse-heap of the farmyard to nourish his crops, but buys loads of fertilisers made from nitrogen withdrawn from the air. Real coffee is becoming less and less common on the table, inasmuch as the substitutes are cheaper than, and in this particular instance, it is said, superior to, the genuine article, because the deleterious contents present in the natural product are eliminated. In Germany alone over two hundred thousand tons of artificial coffee are consumed every year. Champagne is no longer derived entirely from the grapes and district of that name in France; while even Cognac comes from other countries and grapes than those generally associated with its production. So far as foodstuffs themselves are concerned, the category of substitutes is far more comprehensive and varied than the list of the genuine articles. Jams are mysterious compounds made from vegetables and

treated with synthetic products to give them the proper flavours and colours. Milk is being made from the soya bean. The juicy steak or the tender chop is no longer necessarily a prime cut from the animal; vinegar is a concoction of coloured acetic acid; edible oils emanate from the greases contained in the heterogeneous refuse filling the dust-bin; and even bread has been made from sawdust. The ancients employed stone for building purposes, but the modern man employs brick, cement, sand, lime, and concrete, with objects moulded in concrete to take the place of costly stone carvings. Buttons are not made necessarily from bone, but from milk; mother of pearl is no longer derived exclusively from the oyster, but from the factory. Indeed, there is no limit to the ingenuity of the producers of substitutes. At the same time, there is a wide difference between substitutes and imitations, but unfortunately in practice the difference has been narrowed down so much that both come under a cloud. This is a mistake. In many instances the substitute is indispensable owing to the scarcity of the genuine article; the imitation, on the other hand, is a fraud, and should be exposed, especially as in most cases it is an indifferent representation not of the genuine but of the substituted article.

A 'SMUDGELESS' INK.

From time to time so-called indelible and smudgeless inks have been placed upon the market, but their applications have been severely limited. Everyday commerce has not extended a sympathetic support. Yet some improvement upon the inks commonly used is imperative, especially when the fickle characteristics of the British climate are borne in mind. The address in ink on most envelopes becomes an indecipherable smudge when exposed to the rain, and missives consequently suffer when transmitted through the post, while labels on parcels become so indistinguishable as to prove beyond the capabilities of the most expert readers. For this reason, a new imperishable ink which has been introduced should receive a warm welcome. It is both damp-proof and rainproof. It can be soaked in water and yet it will not run, being as clear, perfect, and distinct as before immersion. It is fluid, and dries a grayish black, so that it may be used with all classes of pens, and is indeed so permanent as to outlast the material on which it is used. It should prove invaluable to nurserymen, merchants, and all traders for use on tags, labels, and direction and consignment cards where permanent legibility is desired.

THE PULMOTOR.

Among the emergency devices for succour of humanity which have been tested during recent times, the pulmotor has aroused considerable attention. This is an oxygen device designed primarily to induce respiration by artificial means

in persons overcome by noxious gases or electric shock, in the apparently drowned, or in other cases where breathing has been impaired seriously or stopped, but where a faint heart action still persists. Instead of manual effort being relied upon to inflate and deflate the lungs, as in the Sylvester and Schäfer systems, such rhythmic action is performed by the aid of this machine, and the pulsations of the device are so adjusted as to coincide with the normal number of respirations per minute of the patient. The motive-power to this end is an oxygen cylinder containing oxygen compressed to one hundred and fifty atmospheres; it supplies a 60 per cent. atmosphere of oxygen and air for about forty minutes, when the empty cylinder may be replaced. The complete apparatus weighs about fifty pounds, so that it can be carried about by automobile or ambulance-wagon with ease. There are two separate pieces of mechanism, one being an ordinary oxygen inhalation receptacle, which is brought into use after the patient has been brought round sufficiently to be able to breathe without assistance, and the artificial respiratory device. The most striking part of the apparatus is a small leather accordion-bellows, which effects the automatic reversal of the apparatus from filling to emptying the lungs, and *vice versa*. The mixture is adjusted by the aid of valves, and the atmosphere is forced into the lungs at a pressure of about three-tenths of a pound, when it is exhausted. The effect produced by this mechanical agency is practically the same as obtains when a conscious man is breathing heavily. The fact that the action of the mechanism adapts itself automatically to the capacity of the lungs constitutes one of the most salient features. The face itself is enclosed in a mask strapped to the head, so that the full effect of the respiration is produced upon the patient. As the apparatus is automatic in its operation, the attendant's efforts are confined solely to keeping the windpipe open and closing the gullet. The device has been subjected to very searching tests, one organisation having installed twenty-three machines, and during ten months twenty-four lives have been saved thereby. It has emphasised its utility in cases of noxious gas asphyxiation, morphine poisoning, surgical operations, and electric shock. Two large companies in New York city which have taken up these appliances for their own establishments allow them to be used at any time of the day or night for saving life either in the street, in buildings, or elsewhere.

A SOAP-HOLDER.

The public are loud in their cries for the provision of facilities upon railway trains, but unfortunately a large number of travellers entertain quaint ideas concerning honesty, and consider the cake of soap in the lavatory quite lawful prey. The consumption of this commodity upon our railways is enormous, and in order to reduce

the outlay two South African inventors have devised a novel soap-container to frustrate the pilferer. It is of a simple character, while its use is by no means confined to railway cars, but is equally applicable to hotels and other places where washing convenience is provided. It comprises a small nickel-plated rod carrying a screw and nut, and can be readily attached to existing fittings. From this rod projects a small bulb containing a spring and a length of chain. A shackle is fastened to the lower end of this chain, to which the cake of soap is attached, and which cannot be released except by means of a key. The soap itself is penetrated by a kind of staple. When the soap is not in use the length of chain under the action of the spring is drawn up clear of the basin to hang high and dry. All that is necessary in use is to draw out the cake of soap on the chain, there being sufficient length of the latter for this purpose. When released the chain flies back. At first sight the device may seem to offer no protection to the cake of soap, but it is one of the curious features of human nature that while an article lying free is not immune from acquisition, one tethered is not likely to be purloined. Still, should the device save 50 per cent. of the cakes of soap from entering the user's valise, the invention will have fulfilled its end.

AN ACCOUNT REGISTER.

A useful Canadian invention for certain classes of retailers is an account register which, with one writing, takes a complete and accurate account of all goods sold on credit. The system is extremely simple, and was invented a few years ago by a merchant for his own use. Over one hundred thousand registers are in use in Canada and the United States, and a number are finding their way into this country. It is particularly well suited for grocers or butchers who do a regular everyday credit business. The order is taken on a triplicate order-pad with one writing. One of the slips goes with the goods to the customer, who is provided with a slip-holder; the other two going into the register. Each customer has a numbered compartment to himself, so that his account is found without delay. Every time a person orders goods the amount standing in the register is brought forward and added to the present order, giving the total indebtedness at the date of each purchase. This operation does not require more than a second, the metal leaves of the register being fitted on a 'gravity' or pull-down arrangement. At the end of the week or month the customer gets one set of slips with the last uppermost, which gives the total of the account. After the account is settled, the remaining slips are taken from the register and filed in a loose card index drawer beneath for reference. This system tends to accuracy on the part of the shopkeeper, as the customer can check his order and see at a glance how much he owes each time, and can if necessary regulate his

purchases accordingly. But its greatest importance is to the shopkeeper, by whom the drudgery of bookkeeping is avoided. It dispenses with day-books, ledgers, journals, and passbooks. His accounts are always up to date, and as a time-saver those who have tested it say its value is greatly in excess of its cost.

A PALÆOLITHIC HUMAN SKULL.

The discovery of a palæolithic human skull and mandible by Mr Charles Dawson near Piltown Common, in the parish of Fletching, Sussex, is regarded by *Nature* as the most important discovery of its kind hitherto made in England. It was found in gravel deposited by the river Ouse at a time when that river flowed at a level of eighty feet above its present course. The gravel consists largely of iron-stained flints, amongst which were also discovered fragments of the molar tooth of a Pliocene elephant and a water-worn cusp of the molar of a mastodon. Teeth of the hippopotamus, beaver, and horse, and part of the antler of a red deer, were also found, with several unabraded early Palæolithic implements. Dr Arthur S. Woodward, of the Geological Department of the British Museum, who described the skull before the Geological Society of London from a restored model, said it proved to be very different from the skull of any class of man hitherto met with. It had the steep forehead of a modern man, with scarcely any brow-ridges, and the only external appearance of antiquity was found in the occiput, which showed that in this early form the neck was shaped not like that of a modern man, but more like that of an ape. The brain capacity was only about two-thirds of that of an ordinary modern man. The mandible differed remarkably from that of a man, and agreed exactly with the mandible of a young chimpanzee. It still bore two of the molar teeth, which were human in shape; if these were removed it would be impossible to decide that the jaw was human at all. The skull differed so much from those of the cave-men already found in Germany, Belgium, and France that it was difficult at first to interpret it. All the cave-men hitherto found were characterised by very low foreheads and very prominent brow-ridges, resembling those of a full-grown ape. The new specimen was proved by geological considerations to be very much older than the remains of these cave-men. The skull was very similar to that of a young chimpanzee, while the skull of the later cave-men had the brows of the full-grown chimpanzee. Dr Woodward said that the changes which took place in the shape of a skull in successive races of early men were exactly similar to the changes which took place in the skull of an ape as it grew from youth to maturity. He inclined, therefore, to the theory that the cave-man was a degenerate offshoot of early man, and probably became extinct, while surviving modern man might have arisen directly from the primitive

source of which the Piltown skull proved the first discovered evidence.

INFANT CONSULTATIONS AND THE MILK QUESTION.

In the course of a review in the *Athenæum* of a book on *The Milk Question*, by M. J. Rosenau, the writer says that during the last five or six years an attempt has been made in the chief European countries to provide the necessary intelligence and care in the form of schools for mothers and infant consultations. Consultations go to show that it is far more important to regulate the amount of cow's milk which the individual child requires than to trouble about the bacterial content of the food. The following method is very generally adopted at the consultations in this country. The mother is told to boil the milk when it arrives, and then pour it into a clean jug, cover the jug over with a piece of clean paper, tie the edges down with string, and place the jug in a basin of cold water. We do not think even Pasteurised milk has any advantages over this simple method of boiling, because Pasteurised milk will not remain germ-free unless the bottle is kept on ice or in cold water. The researches of Finkelstein show that there is no appreciable difference in the nutritive value of boiled and of raw milk. The prejudice against giving the former in infant feeding is fast disappearing. The real problem is, after all, to adjust both the quantity and the quality of the food to the digestive capabilities of the infant, and this can only be adequately done under medical supervision. It is high time that the services of the clinical physician should be recognised as forming part of the public health service in preventing diseases in infancy. In some parts of the country municipalities are fully alive to the importance of the subject, and have already appointed medical practitioners to supervise this department of public health.

WHY SMOKE IS INJURIOUS.

Smoke-abatement societies have been advocating the use of gas-fires and cooking-stoves in order to lessen the smoke nuisance in large towns. Dr Raymond C. Benner of New York has tried to ascertain why smoke is injurious to organic life, animal and vegetable, and his conclusions are that the harmful ingredients in smoke are both solid and gaseous, and consist in general of sooty particles with tar and accompanying acids. The amount of free acid in soot may be quite large, while arsenic is sometimes present in a very small percentage. Its nature and composition make it the worst possible kind of dirt; the tar in it gives power of adhesion, while the sulphur acids corrode certain substances. To plants it is prejudicial, as it prevents transpiration, while the tar and acids are corrosive. Conifers seem to be most easily affected. A section of a Scotch fir decreased in width of rings after the date of the erection of a smoke-producing factory near the

tree; while vegetables planted in smoky towns are stunted where there is a fall of soot. Limestone and sandstone are corroded by the acid in soot; the sulphuric acid acts on the calcium carbonate, freeing carbon sulphate and disintegrating the stone. Rails corrode six times as fast in a town as on a sandy coast. Soot has also a marked effect on weather in cutting off the light and increasing the duration of fog. It has been said that at least 20 per cent. of London fogs between 1st September 1902 and 31st March 1903 were artificially induced and preventable. In some measurements of sootfall in 1902, during one snowfall there were eight hundred and twenty tons of soot per square mile in Glasgow; five hundred and thirty-nine tons per square mile in the industrial centre of Leeds, and only twenty-six tons in its suburban residence area; and in the centre of London four hundred and twenty-six tons.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

MARCH 1912.

'The land of far distances.'—ISAIAH.

IN hard-won rest they sleep in that strange land,
Their monument the unsmirched frozen snow
That points to where the unfamiliar stars
Illumine with their glow.

Around them silence—brooding, solemn, vast—
Creating in those spaces peace profound,
Where God alone, since daybreak of the world,
Eternal calm has found.

Not unaccompanied was the tragic road
To where Death stood to free with firm, strong hand,
From Life who feebly strove to bar the way,
Faltering at his command.

Valour and hope, imperishable faith,
Marched step by step with those stout, dauntless
hearts.
The things unseen eternally remain,
The seen with time departs.

And all the while the pallid English spring
Was kindling gorse, and quickening 'neath the sod
The daffodil and gleaming crocus buds—
The little flames of God.

For she whose curved hand guards the fire of life,
Whose feet had never stepped on Arctic snows,
Had risen again from the dim underworld,
And passed where west wind blows.

BEATRICE ALLHUSEN.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

THE HOUSE BY THE MOOR.

By E. B. SHULDHAM.

PART I.

THE House by the Moor. Where did it stand, and what special interest did it awaken by its conditions or surroundings that it should have touched me so deeply in my far-away student life, and lived in my memory for fifty years? Moorlands—so let us name it—was an unpicturesque, commonplace-looking house of the eighteenth century, with walls of gray stone, and roofed with slate. It stood in the centre of some uninteresting grounds, where a moorland landscape revealed itself coldly beyond the house rather than gently enclosed it, together with the adjoining paddock, lawn, and garden. The best that could be said of the place was that the soil was dry and the climate bracing; but as for beauty, it had little or none.

The light, the life, the interest lay within doors; landscape and architecture were as naught; nevertheless the house and its surroundings have lived in my memory for many years, for the associations are with death.

How did this come about? I will tell. But to do this I must go back some fifty years. This will take me to my life as a medical student, and will bring to me, as in a picture, tall, cold, gray houses set against a blue sky, and the broad shoulder of a hill, shaped somewhat like an elephant's back, with a lion's head attached, that seemed to support the straggling outskirts of a city which now numbers some three hundred thousand inhabitants.

This will bring to mind some gently rounded hills, a three-mile walk south-east from the city, with a drapery of snow about them with the chaste outlines of a woman's breast. There is a great rock set in the city's midst, and on the rock is set a castle. Ever and anon the roll of a drum or the call of a trumpet rises above the city's murmur, and signifies to the dwellers below that military life is stirring on this defiant rock.

I turn away from the castled rock, and my eye lights on another eminence, less defiant and also less proudly picturesque. Gray stone temples, with a slight trace of ruin about them, and gray stone pillars decorate the heights—an abruptly ending dream of the Greek age.

I am in Modern Athens.

A student of medicine, I am a pupil of John

No. 123.—Vol. III.

Goodsir, the splendid old transcendental anatomist, with his halting step and his inspired thinking. I am dresser to Syme, the curt, epigrammatic surgeon of whom it was said that 'he never shed a drop of blood or of ink too much.'

I am apprenticed—that may sound very old style to some who read these lines, but nevertheless it is a fact—I am apprenticed to a cousin by marriage, a brilliant young surgeon, a man of many words and many thoughts, the opposite of Syme in this respect, but as a skilful and bold operator his equal—nay, many of us young students thought him the superior of Syme.

There is much to be learned, to be seen, to be felt. 'Ay, there's the rub,' to be felt. Do medical students ever feel? Sometimes. One did, at any rate, some fifty years ago. Let me, then, give an occasional experience of my student life. Though I was a pupil of the great Syme, having taken a dressership in his wards for six months, there was but little personal contact between master and pupil. To me he was curt, dry, abrupt, unapproachable. But my relations with my cousin were of a different character. I had been intimate with his family for years. I was in daily contact with him; both in literature and in art we had common grounds for sympathy. His wife was the daughter of a distinguished Scottish publisher, and was an accomplished artist; so the surgical alliance between my cousin and myself was lightened somewhat by contact with the literary and artistic world to which his wife belonged.

Well, as my cousin's apprentice I became his surgical assistant, helped him in nearly all his operations, and so gained knowledge of disease and steadiness of nerve.

And all this brings me without further prelude to the house by the moor, for the incidents connected with it furnished a well-marked chapter in my life—a chapter which even now sets me thinking and wondering and almost sorrowing, as I turn over the pages of that dreary past.

One bitterly cold morning in March my cousin, Alexander Mackenzie, asked me to go with him to a case some sixteen miles down the line south,

APRIL 5, 1913.

[All Rights Reserved.]

as he had an operation to perform on a private patient.

'Why, certainly I will come with you. What train are you going by?'

'Twelve-fifteen from the Waverley Station. I'll meet you on the platform. Bring your pocket case, for I shall want you to act as my assistant. Farquharson will give chloroform. You will have a fee.'

This was quite news to me. It was the first country journey I was to take with Mackenzie, and it was my first fee. Though I was only in the third year of my student life, my cousin had often left his cases entirely under my care after operation, and the poor folk of Edinburgh who came in my way as dispensary patients dubbed me 'doctor,' much to my delight.

'Can I do anything for you here?' I asked as a dutiful apprentice.

'No; that's all for to-day. But don't get messing with your paint-pots and lose the train.' This was a parting shaft at my fondness for art.

So away I went to my lodgings to think over my day's work and to smoke a consolatory pipe; for, in spite of the prestige attached to helping my cousin in a private surgical case, in my heart of hearts I should have much preferred staying at home and working at a bit of 'still life.'

It was a free day as far as my university work was concerned, and my chief hobby in my leisure time was painting. But my brushes must be idle that cold March day, for I should only manage to get about an hour's painting in all, as I needed a quarter of an hour to put palette and brushes in order and arrange my model. The word 'model' sounds academical and impressive; but, after all, my model for the day was only a ginger-jar. A delightful old ginger-jar, all the same, soft and gray in tone, with little wisps of reed-work round the body of it, and a yellow handle of reed which rose above the lid as a crescent and seemed to carry a line into the background. There was a touch of red on the lid where a splash of dull, oriental sealing-wax had been laid in order to secure the merchandise and also to identify it.

I had a good look at my model, tried it in various positions against a dark background such as the French Chardin loved, and placed an orange by the side of it, which broke the line of the jar, and made the dark corner of my room glow with colour. I then hunted up a scrap of canvas with the beginnings of a landscape on it. The start of landscape was wretched work, and so I was all the more willing to blot it out from sight. There, now for a bit of charcoal. I'll just rub in a little suggestion. Hang the charcoal! It always breaks when I am excited. However, that's a better start than the feeble landscape.

Can I just touch it with colour? Why, what's that striking? Twelve o'clock, by all that's official! I must be off.

Just in time to meet my cousin on the platform, and then down the line we rumbled to our destination in about an hour's time.

Mackenzie was deep in a book during the journey—a novel, one of George Eliot's. I looked out of the window to try to find some beauty in a Scottish winter landscape; and when the vision of my ginger-jar, with the orange glowing by its side, came up before me, the winter landscape looked bare, desolate, and void of interest.

This association of a novel with my cousin's way of life reminds me of a neat rebuff he once gave a hard-headed Aberdonian friend of his. Mackenzie was reading a novel one day after his day's round of work; he was comfortably stretched on a sofa, and the novel and the posture of the man who was reading it seemed to vex the righteous soul of the Aberdonian—who, by the way, was a minister—so he said, 'I wonder, Mackenzie, you care to read such stuff as that. Now, when I read a book I like to have something in my hand that I can put down now and again, and ask myself, "Do I really understand this?"' Mackenzie replied from his sofa, without even looking up or putting his book down, in an indolent kind of drawl he affected at times, 'Oh my dear fellow, how awfully tired you must be of saying "No"!'. The Aberdonian had no reply ready, and so Mackenzie was allowed to finish the chapter of his novel in peace, and many chapters after.

One reason I had for looking out of the window was to see if there were any little sedgy pools by the side of the line; they are very often met with in a flat country line of travel, and I have a weakness for them. After passing gravelly banks, and lines of fencing and trees that shut out the distance, it is quite refreshing to come across some little pool whose darkness may be lightened by the reflection of one white cloud. The cloud has been wandering about abstractedly, as it were, in the sky above, and by chance peeps into one of Nature's looking-glasses set below, and is not a little proud of the reflection. Possibly it sets the cloud a-thinking.

On my side of the line the little pools were few and far between, and their surface was a dull mirror of thin ice. The rushes by the edge of the pools were dry, brown, yellowish canes tendered with the silver of a night's frost, and the dabchicks had found shelter in some warmer quarter. But still there was enough beauty to interest me and to make me long for my home in the south, where I had seen the tall flag rear its luxuriance to a summer sky.

'By the way,' I said to my cousin as we came up the drive to the house, 'what is the patient's name?' This was not said out of mere curiosity, but I always like to know whom I am talking to, for courtesy's sake.

'Oh, name? Never mind the name. It is to be kept secret from you, and it was on this understanding that I brought you here. You see

that elderly man walking in the shrubbery? That is our patient's father; he is keeping out of doors for an hour. The servants have been sent out of the house, as it is a fast-day, and they do not know that an operation is going to be performed. The mother and her two daughters will be the only people left in the house besides ourselves until the operation is over.'

Then my cousin turned abruptly round to me and pulled his cane-coloured beard with an impatient air. 'Bah! what does it matter to you, Edward, name or no name? You must have your wits about you, and be a handy assistant to-day; that's your affair. Here we are.'

Just as we got out of our hired trap the front-door was gently opened, and I heard a woman's voice say softly, 'Oh Mr Mackenzie, I am so glad you have come! Jessie has been wearying to see you; she wants to get it all over.' It was the patient's mother who spoke. 'Dr Farquharson is upstairs with her, having a little chat.'

Then Mackenzie brought me forward. 'Let me introduce my cousin to you. He is going to help me to-day.'

No names were mentioned on either side. I bowed and tried to look discreet beyond my years. The patient's mother gave me a pleasant smile.

'But come in here and warm yourselves by the fire a moment. You must be nearly frozen this bitter day;' and she led us into a cosy dining-room, with a wood fire burning on the hearth. Then going to the sideboard, a beautiful example of eighteenth-century work, she brought out from the cellaret a little decanter of whisky, with some liqueur-glasses.

'It is very old Glenlivet, and my husband says it is very soft, and a little sup of it would not hurt even a cat if she fancied it.'

I was under the impression that even Scottish cats were testoterals.

My cousin declined, and as his dutiful assistant I followed his example. Mackenzie, like a good surgeon, took his Glenlivet after work, not before it.

'Then you won't be tempted?'

'Not just now, thank you.'

'Then let us go upstairs.'

The patient's mother was a tall, dignified woman about sixty years of age, with keen gray eyes; but when she smiled the keen look was softened, and I thought there was at times a sadness about the mouth which did not quite harmonise with the keen gray eye. But the first impression this fine Scottish lady of the old school gave me was that of a tall, active, shapely, well-featured woman born to command. Then upstairs we went to the patient's bedroom, which looked as if it had been cut off from the room adjoining, or as if it had been at one time a passage, and for architectural convenience had been turned into a room. It had a top light, and would have made a capital little studio for my 'still life.'

Mackenzie had chosen it on account of this light, but for a very different purpose.

Just as we came into this narrow but well-lighted room the daughters came forward, two bright, happy-looking young women, and they chatted and laughed with my cousin and Dr Farquharson as merrily as though they were going to keep a birthday festival; and the gaiety seemed natural, so unlike, thought I, the mood and manner of all others whom I had seen on an operation-day. The patient herself was a tall, graceful woman of about five-and-twenty years of age, with a quickly moving eye, full of life and light, and with dark hair mellowing in parts into rich brown, and here and there a few threads of gold glittering on the dark mass. I could but look with wonder and admiration at this bonny creature coming to meet her fate with a smile on her lips and courage in her heart. Some good old Scottish blood flowed in her veins, without doubt. Student though I was, I had seen enough of surgery to know that there were dangers of many kinds which followed the simplest operation. Here, thought I, are the brightness and beauty of youth, and in less than twenty minutes the first faint shadow of death may fall on this bright life.

The patient went quietly under the influence of the chloroform given by Dr Farquharson, and sank contentedly into a deep sleep. My cousin got to work, and the stillness of the room was only broken by the deep breathing of the patient in her chloroform sleep. An hour's work, then all was ready for a visit from the mother and sister of the patient, who were called into the room by Mackenzie, and told that all had gone well. They came and stood by the bedside; and while the mother kissed her daughter's forehead tenderly, the sister took one of the patient's hands, stroked it lightly, almost reverently, and laid it again by her side.

'Do you feel all right now, Jessie?'

'Yes, mother,' said the patient in a faint voice, more like a whisper than a pure tone, and she closed her eyes and looked so worn and helpless that I pitied her with my whole heart. What had I to do with pity—I, a medical student, Syme's dresser and Mackenzie's apprentice? Was this pale, shattered invalid the bright, healthy-looking woman of twenty minutes ago? Was the shadow already touching her? I knew not, but I feared so.

Just about a week after my first visit to Blakieston, Mackenzie sent a note to my lodgings:

'DEAR EDWARD,—The patient at Blakieston is doing badly. The family want you to stay a night at the house. Will you go? Farquharson is laid up with bronchitis. A train leaves Waverley Station at 6.5 P.M.—Yours truly,

'A. MACKENZIE.

'P.S.—Yes, you must go. Take it as a great compliment. I can't get away to-night.—A. M.'

There was nothing left for me to do but to take the 6.5 P.M. train and sit up with my mysterious patient. Besides, this time I had no temptation in the way of a gray ginger-jar to paint at my lodgings. Grays and yellows would be lost by lamplight.

I am once more in the train for Blakieston. I pass the sedgy pools, but the light is dim, and I can scarcely trace their outlines. There has been a fall of snow since my last visit; it gleams on the fields as we hurry along, and the light seems to come more from the fields of snow than from the sky above. A great bank of dappled clouds, silver-gray, rises up with Scottish solemnity from the snowy landscape. The moon is away up behind the clouds, and she gives us but scant light on our road to Blakieston.

The light in the train is also dismal, too dull for me to read by; the outlook from the carriage window is a vague mystery, barely Whistlerian, so I close my eyes and try to sleep. My thoughts again fly southwards. I dream of a spring landscape; no barren hills oppress me; no cold winds whistle their insults in my ears; springtime is here. I am no longer a student of medicine; I am a careless lad wandering with a sweet-faced girl from Tewkesbury in a Gloucestershire orchard. The sky is blue; the very fields smile a welcome to me; the wild flowers are at my feet. What a scent there is from those apple-blossoms close by! How sweet is the thrush's song! The snow on those branches is gently flushed with crimson, but it is not winter. My sweetheart's hand is clasped in mine. Ah, but I am happy in my dream! Why does it fade away so soon in this cold country of the North?

The hour of my journey is nearly gone by; the train is slackening in its speed; the dull rumble of the train, which had lulled me to sleep, gives place to jerky movements and creakings of wheels, which now turn slowly; there is a faint whistle; then lights flash on a platform bare of passengers, and I am at Blakieston.

I am the only traveller that alights here. I stare about the platform to find somebody who may be looking for me, and presently a young man-servant steps up to me in an abrupt manner. 'You're no' the doctor for Moorlands?' he says tentatively.

'Yes; I've come for Mr Mackenzie. I am going to sleep at the house to-night.'

'Ah, weel, that's a' richt;' and he leads me off with the air of a man who has caught somebody very much wanted. In his eyes I am a something wanted, and, to his triumph, I am the something found. My small store of medical usefulness is naught in his eyes. 'Tcha!' he thinks to himself, 'jist ane o' they young students at Embro'; there's plenty o' them nae doot.'

But nevertheless he has orders to convey me safely, as a kind of parcel, to his master the laird, who is in need of me.

I give up my ticket, I cross the little waiting-room, and there, to my delight, is a snug brougham in readiness to take me to the patient's house. They are kindly people after all to think of the comfort of a poor student this bitter evening. The sudden rousing from my doze has chilled me somewhat.

The moon has come out of her tall watch-tower above me, the bank of dappled clouds is breaking; light streams along the snowy road, the snowy fields. There is a glitter in the roadside; the moon has touched a bit of ice and turned it into a silver dish. A row of tall poplars skirts the road on each side for a couple of hundred yards. It puts me in mind of a little drawing by Turner which I have seen, where just such a row of poplars was set before me, with snowy fields on each side, and with a troop of soldiers trudging through the snow, and a dappled sky above. Ah, there we swing round that corner, by the finger-post, where Farquharson's trap was once upset. This, then, is Moorlands! What is to be my next experience? I wonder, but I am not anxious to learn.

'Doctor, is that you? You have been a long time in coming,' said the patient as she turned her head on the pillow to look at me. 'Jeannie, Jeannie, what are you thinking of? Why don't you give the doctor a chair? You see how tired he looks. Not that one, Jeannie; you've left my skirt on it; that was careless of you.'

Then speaking slowly, with a strong accent on each word, she said, 'No, it is not my skirt; it is a great, white, long-eared cat that sits there waiting, waiting for its chance to spring at you.' And suddenly she seized my arm, raising her voice almost to a shriek, 'Be canny wi' it, or it will tear out your heart, doctor;' and then her voice sank to a faint sound, a mere murmur of speech, and she said, 'as they have torn out mine. I've no heart left now; Mackenzie took it away wi' him yon day of the operation.' Then she took my hand and laid it on her breast. 'It's not there now; it has been taken away; but you must find it for me and bring it back to me by the morrow's morning. Try, doctor; try. I know you can do it;' and she looked into my face with such a strange, sad air that I could not help being touched by it.

Her sister was visibly affected; but it was my duty to listen quietly to this wandering talk, and to accept it as perfectly rational; so, in accordance with this belief, I said, 'I'll do my best for you, rest assured of that;' and I touched the back of her hand lightly with the palm of my own. The touch seemed to soothe her, and at the same time she took comfort from my words. 'But you must not mind my staying here a little while, just to see how you go on,' I said as a kind of apology for not going at once on her quest. 'Mr Mackenzie was anxious for me to'—

'Anxious! Why anxious?' asked the patient, interrupting me quickly. 'Hasn't he taken my

heart away! How can a man be anxious who could do anything so dreadful! I ask you, doctor, was it fair, was it right of him?' Then, with a rapid change in her mood, she said plaintively, 'But you see he could not help it; it was his business to do it. I suppose it stood in the way of the growth; and I was being slowly consumed wi' yon growth. Yes, mind that now,

slowly consumed; and they told me he was such a splendid surgeon, and'—— Then she shut her eyes as if she were tired and would fain sleep; but she added in a few moments, 'And now look at me;' and she sighed, and put both hands across her eyes, as if trying to shut out something that troubled her brain.

(Continued on page 297.)

OLD-TIME SOLDIERING IN INDIA.

By Captain OWEN WHEELER, Author of *The Story of Our Army, &c.*

SOME idea of the life led by a young officer in southern India toward the close of the eighteenth and at the beginning of the nineteenth century may be gleaned from the correspondence and biographical records of three distinguished men, all of Scottish descent, and two of them connected by marriage, who both as soldiers and administrators served the old East India Company long and well. The career of General Sir John Malcolm, who finally vanquished the Mahrattas at Mehidpur, and was afterwards Governor of Bombay, is impressively related in Kaye's notable biography. The life of Sir Thomas Munro, the son of a Glasgow merchant, who eventually became Governor of Madras, has been written by Gleig, and in a shorter form by Sir Alexander Arbuthnot. There is also a useful memoir available of the last member of the trio, General John Briggs, sometime Resident at Nagpur and a prominent Orientalist, whose grandfather came south from Scotland after Culloden, and whose first cousin, Admiral Sir Thomas Briggs, was first cousin also to Sir John Malcolm. In none of these three cases does the biographical record or correspondence give an altogether satisfying account of what a young 'Company's officer' did, and how he fared rather more than a hundred years ago. But a composite sketch, with a few additions, may serve to give a fairly coherent idea of a phase of soldiering curiously interesting in the queer mixture which is indicated of monotony and strenuous action, of ease and hardship, of small beginnings and very big endings indeed.

To obtain a cadetship in the East India Company's military service was not a difficult matter if the lad had the right sort of connections, and was sufficiently presentable to pass muster before a committee of directors at the India House. There were no fixed rules as to the age of entry, and it is on record that Sir John Malcolm obtained his cadetship when he was little more than twelve years old. But his was an exceptional case; and, good as his backing was, he would almost certainly have been rejected if one of the directors had not chanced to say to him, 'Why, my little man, what would you do if you were to meet Hyder Ali?' 'Do, sir?' replied the boy. 'I would out with my sword

and cut off his head!' The youngster's spirit so charmed the director that he was 'passed' forthwith; but as a matter of fact it was not until eighteen months later that John Malcolm landed in Madras to commence one of the noblest careers ever run in the 'Shining Orient,' now less poetically described in Service language as the 'Shiny East.'

Some details of the voyage out are supplied by Briggs, who left Portsmouth on 1st April 1800 in one of a fleet of twenty or thirty East Indiamen, which were convoyed as far as the Canary Islands by two line-of-battle ships and a frigate. The total number of cadets for the year was one hundred and seventy, and on Briggs's ship there were about thirty youngsters intended for either the Army or the Civil Service. The voyage, which seems to have been very pleasant, although Briggs mentions that there was 'a great deal of drinking,' lasted over three months, the date of the cadets' commissions being regulated by their arrival in India.

On landing, the cadet joined as soon as practicable the cadet company at Chingleput, a fort about thirty-six miles from Madras. Here he was provided with military clothing and accoutrements, and as soon as he had learnt a little drill was employed in ordinary garrison duties. The batch of about two hundred cadets was in charge of a captain-commandant, assisted by two or three junior officers and a number of steady sergeants. There was a regular mess, the cost of messing being deducted from the cadets' pay of eight pagodas, or about three pounds a month. For instructional purposes the cadet company was told off in squads, with a sergeant-instructor attached to each.

In addition to drills, guards, and other duties, each cadet had to receive for a specified time daily a *munshi*, or instructor in native languages. It happened sometimes that the cadet was inclined neither for work nor for the *munshi's* company, and various expedients were resorted to in order to get rid of the poor man, who, being in the Company's service, was under an obligation to give some sort of lesson. It is related that on one occasion, when a conscientious *munshi* refused to budge before his time, his pupil—afterwards an officer of some distinction

—alyly emptied a powder-flask under his chair, carried a train thence to the door, and fired the train. The result can be imagined. The unfortunate man was not only dreadfully frightened but badly burned, and the cadet received condign punishment, in which a solatium to his victim was very properly included.

The commandant of the cadet company in Briggs's time was a very competent disciplinarian, with a shrewd notion of instilling sound military principles into his sometimes rather troublesome charges. Briggs himself happened to be on sentry-go one night in front of the commandant's house when a tropical thunderstorm came on; and, not knowing that in such circumstances he would be justified in taking shelter in the veranda, the devoted youth continued to pace up and down in the drenching rain. The commandant caught sight of the sentry, but did not call him in. Next morning he read Briggs a kindly homily, saying that the lad had exceeded his duty. He added that he had left Briggs out in the rain in order that he might realise the unpleasantness of being soaked through on duty, and take that as a lesson not to keep his men out in bad weather unnecessarily. There is the ring of true soldierliness about this homely little incident, and it is not surprising that youngsters so well schooled should have taken as kindly as they did to the business of actual warfare.

In many cases the transition from duty as a cadet to duty as an officer in the field was very sudden. Munro and Briggs were sent on active service almost immediately after leaving the cadet company, and the latter mentions casually that, as a lieutenant aged sixteen and a half in command of a company, he was once left as governor in charge of an important little fort. Munro was nearly nineteen when he landed in Madras in January 1780. In July he left the cadet company and was posted to a regiment; and in August he marched with the force commanded by his namesake—but no relation—Sir Hector Munro, to meet the invading army of Mysore. For four subsequent years he was almost continuously in the field under Sir Hector and Sir Eyre Coote.

It is not the purpose of this sketch to describe any actual fighting, as there are a fair number of adequate records of the warfare in southern India at this period, which are accessible even to general readers. Yet it may be mentioned in passing that not only was the fighting often of the toughest description, but even the mere marching was sometimes attended by a good deal of hardship. When a detachment of British troops was ordered in 1790 to co-operate with the Nizam of the Deccan against Tippoo Sultan, Malcolm's corps, which formed part of this auxiliary force, marched from Ellore in May, and by the middle of July, after covering some five hundred miles, reached Raichur, in the Nizam's

Dominions. Malcolm writes that the road was terrible, all rocks and deserts, and the temperature one hundred and fifteen degrees for nearly a month. He himself walked almost the whole way, as his horse was sick, and the marches frequently occupied from midnight till 2 P.M. the next day. Provisions were scarce, often there were none for forty or fifty hours, and there was a dreadful scarcity of water, the men in the ranks sometimes going mad and dying in a few hours.

Incidentally, as regards the actual fighting, it must be remembered that to the risks of being killed or wounded there was to be added that of being taken prisoner and shamefully dealt with. In the remarkable *Narrative of the Sufferings of James Bristow, belonging to the Bengal Artillery, during Ten Years' Captivity with Hyder Ally and Tippoo Sahib*, there is a gruesome account of the ghastly indignities inflicted on some young officers who had the misfortune to fall into Hyder Ali's hands. Bristow also mentions the case of a poor ensign who was literally beaten to death by one of Tippoo's officers placed in authority over him.

But we may be sure that active service, with all its hardships and risks, was generally, if not always, welcomed as a relief from the dreary monotony of life in quarters. Even at its best the latter was marked by several grave drawbacks as far as the 'Company's officer' was concerned. In Malcolm's early days the Company's service compared very unfavourably indeed with service in a King's regiment in India. In the Company's army there was then no higher rank than colonel, and battalions were commanded by captains who were junior in precedence to captains in royal regiments commanding only companies. Moreover, officers of the Company's service suffered grievously through the absence of proper furlough regulations. If on account of ill-health or even of wounds an officer took sick leave out of the country, his pay ceased until his return. Accordingly he very seldom did take leave to Europe, but remained in India year after year until in many cases the word 'home' must have had a dubious significance indeed. Even in the case of men who did well the expatriation was often a protracted one. Briggs did not come home for twenty-six years; and Munro, who left England a lad of eighteen, was a middle-aged man of forty-six when he returned for the first time. In one of his letters, the latter remarked that correspondence between persons in India and persons in Scotland who had not seen each other for nearly thirty years, and who might never meet again, was 'like letters from the dead to the living.'

Finally, there were prior to 1800 no regular retiring pensions for Company's officers. Thanks largely to Malcolm's representations, the whole question of the disabilities attached to the Company's service was gone into; the officering of

battalions was brought up to the same standard as the King's regimental system, it was made possible for Company's officers to become generals, and eventually furlough and retiring regulations on a very liberal scale were introduced. But for many years the grievances alluded to above were very real ones, and could not but have produced a strong sense of depression in a service the ordinary surroundings of which were not at all exhilarating.

The life in quarters of a subaltern in a Company's regiment may have been easy, but it was certainly not luxurious. Malcolm and Munro both felt the pinch of poverty, but it would seem that in the case of the former the impecuniosity was accentuated by youthful extravagance. At times 'Boy Malcolm,' as he used to be called, was so hard-up that his biographer, Kaye, tells us he was often 'sore beset for a meal.' Apparently a regimental mess was not always kept up, for there is a story that the lad was one day sent for by his colonel, who said, 'I don't see any smoke coming out of the chimney of your cook-room, Malcolm. Come and breakfast with me.' Malcolm was so angry at what he considered an unwarrantable interference in his private affairs that he either actually called out the colonel, or was with difficulty restrained from doing so. Kaye also mentions having heard of an old native woman who gave Malcolm long credit for provisions, and whom he afterwards recompensed by pensioning her for life.

Munro, after nine years' service in India, wrote that poverty had been his constant companion, and that during the first three years after he landed he had frequently experienced hunger, thirst, and fatigue. In that initial period he had never had any other pillow than a book or a cartridge-pouch, and most of his marching had to be done on foot, as his old horse could never carry him for more than a very few miles. Munro gives the following account of his life in quarters. At seven he breakfasted, and then walked out, usually alone, until ten, when as a rule he returned home and read Persian till one. He then dressed and went over to the mess for what he calls 'dinner,' returning before three. Sometimes he slept half-an-hour, sometimes not, then wrote and talked Persian and Hindustani till sunset, when he went on parade. The parade over, 'I set out with a party to visit the ladies or to play cards at the commanding officer's. This engaged me till nine, when I went to supper, or more frequently returned home without it, and read politics and nonsense until bedtime, which, according to the entertainment I met with, happened some time between eleven and two.'

Malcolm as a youngster was a good shot and a fine horseman; but neither Briggs nor Munro seems to have taken up any kind of sport. The

last-named, however, was very fond of fives, and kept himself in good condition with that and from four to twelve miles walking daily.

What must have contributed not a little to the straitened circumstances of some of these poor lads was the habit of card-playing, which seems to have been prevalent even when a regiment was more or less on active service. Briggs mentions having on one occasion, when on the warpath, lost a good deal more than he could comfortably afford to pay, and being considerably embarrassed in consequence; but in his case the lesson was both salutary and permanent. Doubtless the gambling habit was responsible for some at least of the duels which chequered military life in India, as at home, until a much later period.

Outside the ordinary regimental duties, which were usually of a very slight description, the Company's officer in quarters had, it will be seen, little on which to concentrate his intellectual faculties except the study of native languages, and in this direction genuine proficiency was not infrequently attained. The result was usually satisfactory to the individual officer, but not always so from the standpoint of the Company's service as a whole, since too often merely studious men of linguistic capacity came to be employed in posts for which they were otherwise quite unfitted. In the case, however, of the three officers whose names have here been mentioned, a knowledge of Oriental languages, especially Persian, was happily instrumental in gaining them early opportunities of bringing themselves into useful prominence.

It is a rather pathetic circumstance that, in a military service which should have offered, and to some extent did offer, a grand scope for purely military distinction, the ambition of so many young officers should have been to obtain civilian employment. But it was, of course, quite natural that men like Malcolm, Munro, and Briggs should seek a wider sphere for the exercise of their talents, more especially when the emoluments and opportunities of the two branches of the Company's service are contrasted. Also, it is more than satisfactory to reflect on the splendid examples of the soldier-administrator which were thus forthcoming, and the countless and lasting benefits which that notable class has conferred upon India and its peoples. Of course, both before and since Malcolm, Munro, and Briggs there have been many fine soldier-administrators, and some at least of these were the direct product of other systems or periods. But one may be permitted to doubt whether, taken all round, there has ever been a better training-school for these immensely valuable public servants than the military service—hard, unlovely, and dreary as it often was—of good old 'John Company Bahawder.'

ATLANTIC GOLD.

By J. J. BELL, Author of *A Kingdom of Dreams*, *Wee Macgregor*, &c.

CHAPTER VII.

DAWNED and died four days—days of the calm, fair weather that September gives more or less lavishly to these western shores and waters—days of dull sunrises, hazy noons, brilliant sunsets, sparkling nights. To Arcus they had been perfect days but for his anxiety regarding his friend in London. Yet not with unalloyed desire did he search the horizon for smoke and sail. The despatch of a telegram, had that been practicable, would have sufficiently allayed his uneasiness on Anstruther's account; secretly he hoped that the sighting of a ship would be followed by his host's suggestion, made more than once already, that he should simply send his messages by her and remain on the island until the return of the *Phyllis*. 'You are very welcome to all we can offer you, Arcus; and we do not want you to leave us yet,' the doctor had repeatedly assured him; adding, 'We have indulged a solitary existence too long.' And to Arcus, sensitive as he had become, there seemed more than mere conventional politeness lurking in the words.

As for Florence—he thought of her now by her girl's name—she still maintained the reserve so abruptly adopted on the Woman's Cliff that afternoon; but though she did not offer, she did not refuse him her companionship. As a matter of fact, the two were much left together, Dr Helmsdale, apparently immersed in research in the laboratory, meeting them only at meals and for an hour or so after dinner, when he was as genial and entertaining as ever. He made brief daily visits to the Other Island, returning with a stout leather bag heavily laden, to judge from Hubert's attitude while bearing it from the dingy to the laboratory. He did not invite his guest to accompany him on these trips, and Arcus, though his interest was less keen than might have been expected, began to doubt whether the gold recovery process was open to an outsider's inspection after all.

On the fifth day, however, at lunch, Helmsdale said to his niece, 'I think you might show Mr Arcus the Other Island this afternoon. I should like to do so myself; but there are things here which I really cannot neglect at present. Besides,' he laughed pleasantly, 'you won't give away so much as I might.' He turned to his guest. 'You have gathered by now, Arcus, that I am a dreadfully indiscreet person, have you not? I give away everything.'

Said Arcus, 'I think it will take you a very long time, indeed, doctor, to give away all you know.'

Florence, looking amused, said, 'You seem to have grown a little taller since Mr Arcus came,

Uncle Victor. His frequent compliments must be having an effect.'

'Mr Arcus has a flattering tongue,' responded Helmsdale. 'Yet, as I have often said, I cannot believe in a man performing big work, year in, year out, without an occasional audience. My weakness, no doubt; but there it is!'

'Well,' she said, after the young man had expressed his desire to see the Other Island, 'I can safely promise to bring Mr Arcus back no wiser than he started, because I don't understand a thing about the gold recovery.'

'Blessed ignorance!' murmured Helmsdale. 'We shall have to make her a director, Arcus, when that five million company is floated.'

An hour later, following the girl's directions, Arcus pulled into a narrow creek, and, having secured the dingy's line to a ring fixed in the reef, assisted her, quite needlessly, ashore on the Other Island. It was considerably smaller than its neighbour, and exhibited many signs of having suffered violent natural convulsions at some remote period of its existence.

'I had better lead the way,' said Florence; and he followed her through a maze of clefts and hollows in the ragged rock. The way—it could hardly be called a path, though something had been done by man's agency to reduce its native difficulties and to remove its more dangerous pitfalls—rose from the sea-level in erratic fashion, and brought them at last to a rough, pentagonal plateau, whence was obtained a view of the surrounding ocean. From the southerly side of the plateau, to which they directed their steps, the land dropped to the sea in three hacked and shattered terraces like the remnants of a giant's stairway. To Arcus, descent of these appeared impossible until the girl conducted him to a slim iron ladder fitted with a hand-rail.

'Had the tide suited we should have landed there,' she said, pointing downward; 'but it is too risky for a boat at low-water. Be careful!'

On the lowest terrace stood three substantial log-buildings, one of them, with its curtained window and chimney, suggesting a dwelling. Thither she led the way and unlocked the door, saying, 'This is where my uncle spent the night you were wrecked. He has spent solitary nights here more than once. Hubert sees that the hut is always provisioned for at least a week.'

Arcus found himself in a room furnished like a ship's cabin, with the addition of an oil-stove and a few simple cooking utensils and dishes. A shelf carried several volumes of a scientific nature, also a batch of novels; beneath it, on spikes driven into the wood, reposed six large rockets of the bomb sort.

'One could be comfortable enough here on a dirty night,' he remarked, glancing about him, yet fingering one of the rockets.

Florence shrugged her shoulders shudderingly. 'The limit of loneliness! Oh, the rockets are for signalling to the *Phyllis* to come here instead of to Laskair. We have also used them in foggy weather to guide her. Now I will light the stove and put the kettle on; and when you have seen the gold recovery arrangements—it won't take long under my guidance!—we shall have tea here.'

'Let me help you,' said Arcus.

In passing, it is a little pathetic to note how heartily and humbly a single young man will assist a single young woman in domestic work. Arcus grinned sweetly when he scorched his fingers at the unfamiliar flame, and apologised profusely for dropping the matches owing to Florence inadvertently coming against his arm.

'That is the third island I told you about,' she said, as they stood at the edge of the terrace. 'Only a rock, but useful to my uncle. You see a tiny hut? It covers part of his machinery.'

Arcus looked across the narrow channel, then at the channel itself. It was about seventy yards wide, but appeared to be deep even at low-water. A strong current manifested itself. For a while his gaze remained intent on something beneath the surface—two lines of dimly flickering objects that moved steadily at considerable speed in contrary directions between the islands. 'What are those?' he asked at last.

'I can show you that much.'

She took him to the largest of the buildings, situated on the verge. From its interior came the slow, laboured panting of an engine.

Unlocking the door, she invited him to enter. At the far end of the dusky place a wheel six feet in diameter, its axis inclined about thirty degrees from the horizontal, sedately revolved. On its deeply grooved rim it carried an endless steel cable, light and flexible. From the cable, at intervals of a few inches, thin metallic discs a foot in diameter depended by wires. The cable entered the house by way of a sloping tunnel in the rocky floor. With its appendages it first passed through a closed iron tank, then round the wheel, thence through a cylinder of heavy opaque glass, and escaped to sea by means of a second tunnel. Arcus observed that in the iron tank it parted with its clinging fragments of seaweed; he noticed also that the discs arrived from the sea covered with a dull grayish slime, and from the glass cylinder returned to it bright and glistening.

Florence touched the cylinder with her foot. 'I don't know how to open it, Mr Arcus; but the gold—or whatever he gets the gold from—is there.'

'Does the thing go on working day and night?' he inquired after a pause.

'I suppose so. Monotonous, isn't it?'

'Fascinating, I should say, for the person interested. It's aggravatingly simple, and altogether mysterious. Imagine those little bits of metal collecting gold day and night, year in, year out! Why?—'

'They collect more than gold at present, which my uncle considers a nuisance. But he is hopeful of being able to collect nothing but gold some day. Has he told you his theory about what he calls the tuning of things? No! Oh, it is interesting even to me! He believes it is possible to tune one thing—electrically, magnetically, I don't know which—perhaps I'm talking nonsense; but he believes one thing may be made so attractive to another thing that the other thing cannot resist. Oh dear, I'm getting mixed! Come, let us go. We can come back after tea if you like. I don't like the smell of this place.'

There was certainly a taint in the atmosphere—nitrous acid, Arcus would have said had he ever dabbled in chemistry. 'It rather reminds me of some beastly fumes a chap made in testing for gold or copper or something in Queensland,' he vaguely remarked, and followed her out of doors.

'Nothing there but a dynamo,' she said, nodding in the direction of the third building.

'Then don't trouble to show it to me,' he returned. 'The kettle must be boiling now; and, so far as I have been able to guess your feelings, Miss Helmsdale, that is more important than the recovery of gold.'

'Oh, I'm quite sick of gold,' she said with sudden petulance. 'Forgive me,' she went on quickly, 'for being such an impatient guide. I'm really very proud of my uncle's work here; only I am certain it is bad for his health, and I wish he would stop it.'

'You have shown me all I wanted to see, and given me quite enough to think of for the present,' he said, as they turned toward the hut. 'But surely you are mistaken about the doctor. One does not often see a healthier-looking man. And life here—so much in the open!—'

She shook her head. 'He never used to be nervous. He has grown nervous of late. He is more nervous now than he was a week ago.'

'I hope my coming'—

'Nonsense!' she interrupted a little sharply. 'I was glad for his sake when you came. He needs some one to talk to. He has talked more to you in these few days than he has talked to me in three months. Why, you don't know what'— She broke off. 'After all, I may be imagining things,' she said at the door. 'Perhaps it is I who am growing nervous. Forget what I have said, Mr Arcus. Yes, the kettle is boiling.'

While she prepared the tea he stood at the window watching the two processions of dimly flickering objects traversing ceaselessly the underwaters of the channel. He had never wanted to

'make' money, yet he was curiously attracted by this strange method of getting it. And all at once it occurred to him that he was quite poor in comparison with what this girl was likely to be.

But they talked no more of gold that afternoon. Till the sun was low they talked of life as it concerned themselves, of what she would make of life were she to return to the world, of what he would make of it were he a prisoner on Laskeir.

Possibly their converse held more imagination than wisdom; but it had the result, at least, of increasing their acquaintance with each other's sympathies, which, when one comes to think of it, is the chief end of all converse between man and woman. As they rowed home, almost silent, there was no gold in the world for them but the glory of the sunset on the majesty of the sea. At the landing he was loath to let go her hand.

THE GEOGRAPHICAL DISTRIBUTION OF CAPITAL

By HERBERT H. BASSETT, F.S.S., Editor of the *Financial Review of Reviews*, &c.

A GREAT deal of misunderstanding exists regarding the real object of the distribution of capital geographically. There is a general assumption that to urge the adoption of 'geographical distribution' is only another way of saying, 'Do not put all your eggs in one basket,' which has become an accepted axiom among all who are concerned in the investment of capital. But geographical distribution of capital goes a step farther. It not only says, 'Do not put all your eggs in one basket,' but it adds, 'and do not send the baskets to market in one cart.' It is good to put your capital into more than one security, but it is still better to see that the securities are not all in one country.

The safety of capital distributed on this principle is secured by dividing the sum to be invested evenly among a number of sound stocks of identical quality, but every stock held must be subject to an entirely different market and trade influence. Now, the trend of the trade and the political development of each country vary. The trade of countries which are widely separated geographically, peopled by different races, or whose chief commercial products are entirely different varies considerably; so that while in one country realisable values are rising, simultaneously they are falling in another country. Therefore, by placing portions of his capital in different areas of the world, the investor ensures that all the stocks he holds are likely to differ in the variations of their realisable values, and that, therefore, the total realisable value of his investments is likely to remain stationary.

It is always difficult for any writer on finance to satisfy the reader that he is not personally interested in recommending or decrying some particular investment. Whilst it would be easy, therefore, to give to the reader some practical examples of geographical distribution of capital drawn from the price-movements of securities during the past decade, it will perhaps be best to explain the theoretical side of the principle only.

That the world's population is constantly increasing is admitted; and as the demand of an

increasing population must be met, it follows that the trade or production of the world should also constantly increase. Statistics bear out this fact; but if the trade of various countries is examined, it will be found that whilst the general tendency over a period of years may be for it to increase, the extent of the increase varies in different countries. Thus an examination of Europe's exports in comparison with the exports of the rest of the world over a period of fifteen to twenty years shows that in some years Europe's exports rose and the exports of the rest of the world fell, while in other cases the exports of the rest of the world rose and those of Europe fell. An examination of the figures of production of iron ore in various countries will reveal fluctuations in each country, although the total production was constantly increasing.

Having satisfied himself that the trade of one country may be good whilst that of another is bad, the investor may proceed to investigate the bearing which this condition of trade has upon the value of securities. The value of securities is influenced by the bank rate, or the rates ruling for money in each country. In a time of dear money, such as a 6 and 7 per cent. bank rate, securities will fall; and when the bank rate is down to 2½ per cent. the price of securities will rise. The explanation is simple. Let us suppose that a first-class 3 per cent. 'gilt-edged security' stands at eighty-one pounds per one hundred pounds stock at a time when the bank rate is 5 per cent. If trade in the United Kingdom should become inactive, bankers will not be called upon to lend money to manufacturers, and the rate of interest they ask will fall, until, when trade is very slack, the bank rate may be as low as 2½ per cent. The rate offered to depositors will be reduced by the bankers because the latter cannot lend it at a profit, and depositors, dissatisfied with the low rates offered by the banks, will commence to buy securities which yield a higher rate. Thus the first-class 3 per cent. 'gilt-edged security' which stood at 81 when the bank rate was 5 per cent. will gradually rise to 99½, when the net return yielded to the buyer

will have become little better than the return offered by the banker, and the security will cease to be attractive. The capitalist, the trader, and the investor will let their money lie there until trade becomes again active, when they will sell the securities which yield only 3 per cent., and use their capital in trade, thus causing the price of securities once more to decline.

As the condition of the money market is governed by the condition of trade in each country—I do not propose to plunge into any argument about the alleged machinations of the evil people who are supposed to put bank rates up and down so as to consummate their own villainy—it follows that as trade conditions vary in each country, so also must the ruling rates for money vary in each country. The country's course of trade, therefore, becomes the dominant factor causing the variation in the value of the securities of that country.

The millionaire who possesses sufficient capital to invest money in every trading centre of the world cannot fail to benefit, and does benefit, from the automatic increase in the value of his investments, owing to the world's perpetual trade expansion. The investor who widely distributes his capital over the earth's surface establishes an equilibrium of capital, because the effect of trade depression in one quarter of the world will be counterbalanced by trade activity in another quarter. And here it is perhaps as well to explain that I am writing of the investment of capital—that is, in Government bonds, &c.—yielding from 3 to 5 per cent., and not of gambling with capital in speculative counters, such as mining and oil companies' shares.

Only the teaching of experience will ultimately protect the individual against loss in these directions.

Many persons who have worked at schemes for putting the principle of geographical distribution into practice have spread their capital among British-owned and British-controlled undertakings operating in various parts of the world. The securities of these undertakings are owned in the United Kingdom, and the market for them is in London, and for all the practical advantage the holders derive from the geographical location of the companies' business, they might as well have left the capital in a purely British undertaking working at home.

The investment areas of the world may, roughly speaking, be described as Great Britain, British colonies, north and south Europe, Asia, Africa, North America, South America, and international, the last-named covering international undertakings such as steamship and cable companies, &c. The securities of each of the sections should be governed by the principal Stock Exchange of each country and not by London. An Argentine security should be controlled by Buenos Ayres, a Canadian security by Montreal or Toronto, an Australian security by Sydney or Melbourne, a Japanese security by Tokyo or Yokohama, and so on. Otherwise the full advantage of the compensating trade movements cannot be obtained, because the influences controlling the prices of the securities would not be distributed over various parts of the world, but would be centred in London and be dominated by the trade movement of the United Kingdom.

'A DANIEL COME TO JUDGMENT.'

By C. CAMPBELL BROWN.

ONE summer afternoon a young girl paused in the street, where a shabby scholar sat reading to a group of idlers outside the prefect's yamen of Chuanchow city. She had sold her last 'larded devil,' a kind of dough-nut eaten in that part of China, and the day's earnings lay in her empty basket. The reader's face was livid, his voice was hoarse, and his black-rimmed spectacles made him look like a lean old dragon-fly; but his fingers quivered with the varying emotions of the story, darting, caressing, hovering, insisting, until she quite forgot their brown opium-stains and the cadaverous appearance of their owner.

Some one noticed the girl's absorption as she stood tiptoe peeping between moving heads and shoulders at the histrionic gestures of the scholar; a deft hand moved lightly, and the money disappeared from her basket. When the story came to an end the girl awoke from her dream to find that the precious pile of *cash* was gone. She

spoke of her loss to the people who stood near, but no one helped her; and presently, with the callousness which a Chinese crowd so often shows to misfortune, the bystanders began to laugh. At that moment a spare man of about thirty came out of the yamen and turned into the street. His face, which had a restrained and almost mournful look, had little to distinguish it from ordinary faces except, perhaps, a pair of keen eyes and a long, thin nose.

Mr Li, the prefect of the city—for it was he—noticed the child, who was now 'crying as though her mother were dead,' and told his interpreter to find out what was the matter.

'Tis but a little thing, your Excellency. The child has lost some *cash*, and dare not go home,' said the man.

'How much money has she lost?'

'One hundred and eight *cash*, your Excellency.'

'Ask her how it happened.'

The prefect waited patiently until, between

sobs and terrified pauses, the girl had told her tale. Meantime a crowd collected, as yamen runners, hangers-on of the court, and idlers from the street came sauntering up to see what was happening. Presently his Excellency gave orders that the girl should be taken to the justice-hall, so that her case might be tried. Scarcely crediting their ears, the bystanders began to wonder what had befallen Mr Li. Even supposing the troubles of a crying child were worthy the notice of one concerned with public business, the absence of all proof or evidence in the affair rendered it neither profitable nor wise to intermeddle with such a matter. When, therefore, the people saw him re-enter the court, followed by runners leading the girl, they trooped after them into the great yamen, and even the idlers left their story and the shadow of the wall by the street-edge to see the fun.

The examination, as any one could have foretold, came to an end without throwing fresh light upon the circumstances of the theft. The secretaries pulled each other's sleeve and raised their eyebrows. The bystanders whispered, and some of them began to laugh.

Mr Li spoke a word to the attendants; next moment the yamen doors swung to with a clatter.

'The people laugh,' said Mr Li, his keen eyes glittering as he raised his head and looked at the throng. 'The people laugh at us, "the father and mother of the people," for trying to help a child of one of the citizens of this city! They laugh at a representative of the "Dragon Throne" in the discharge of duty! They must be taught.'

The crowd was quiet now, for the sound of bolts rattling between them and the street had sobered the whisperers.

'Such a breach of etiquette must be punished,' continued his Excellency, speaking slowly and with emphasis. 'Each person shall pay a fine of eight *cash* before he leaves this court.'

The gamins, who had been most forward to see the 'great man's' folly, were now as mum as mice, the students and ragged plea-writers who had thronged into the presence-chamber were ruefully feeling their empty pockets, and there was much covert borrowing among the crowd. Half-amused by their own discomfiture, half-afraid of the man who held them in the hollow of his hand, the people came forward one by one to pay their fines.

As the first man laid his *cash* upon the table, the prefect's eyes—half-sad, half-tolerant and kindly—scanned his face. Then, to the surprise of everybody, the great man carefully counted the coins with his own fingers. The brown heaps of copper money grew upon the table as the crowd filed past, but the doors remained close fastened, and nobody was allowed to leave the court.

Presently a mean-looking fellow came up and paid his fine.

His Excellency counted the coins. 'This

money is covered with grease,' said he. 'What right have you to bring dirty *cash* to me? Pay eight more for your bad manners.'

The man put the money upon the table without a word.

'Hey!' cried Mr Li, 'these coins also are covered with grease! It is against the law to pay dirty money into court. Search your pockets and see whether you have not got some cleaner *cash*.'

The fellow began to search, but the *cash* which he produced were greasy.

'Turn out all the money you have. There are sure to be some clean coins among the number.'

The yamen runners helped the unwilling rascal to empty his pockets, but all the money in his possession proved to be in the same oleaginous condition.

'Count these coins,' said the prefect.

There were ninety-two in all.

'Hey!' cried Mr Li, 'ninety-two *cash*, along with the sixteen already paid in fines, make one hundred and eight—exactly the amount lost by the little girl. How do you account for that?'

'It is just the sum I had in my pocket. I know nothing about the child's money,' protested the trembling rascal.

'Where did you get these *cash*? ' demanded Mr Li.

'I got them from a man in the street in exchange for a ten-cent piece, your Excellency. He must have given me greasy money.'

'Go at once and fetch that man,' said Mr Li. 'I will send a couple of runners with you to bring him into court.'

'The man was a stranger. His Excellency's slave could not possibly find him anywhere,' stammered the rascal, now shivering with terror.

'Go and seek him at once. You may find him more easily than you suppose.'

The man lay in the position which he had been compelled to take before the representative of the Emperor, with his forehead flat upon the pavement, and said nothing.

'You took this money from the child,' said Mr Li. 'It is covered with grease, because she counted it after handling her oily dough-nuts. She lost one hundred and eight *cash*, exactly the sum which was in your pocket when you entered this place. You are the thief!'

A hum of approval spread through the crowded court. Was ever judge so wise as his Excellency, who knew both how to attract into his yamen the kind of people among whom the culprit was likely to be found, and how to single out the thief from amidst the throng when once he had it safe within his power?

After the money which lay upon the table had been counted, Mr Li gave it to the trembling child, who left the court a very happy little girl, followed by a stalwart yamen runner carrying several strings of *cash*.

The slight figure rose from the judgment-seat and slowly withdrew. The bolts shot backward, and the crowd poured out through the open doors.

'The thieves had better emigrate,' said one of the court attendants to his neighbour. 'If they stay much longer with his Excellency in Chuanchow city they will starve.'

SIR WALTER SCOTT AT MILTON-LOCKHART.

By Rev. THOMAS CASSELS.

A FEW miles north of the junction of Carstairs, on the Caledonian Railway, the Scotch express passes through Carlisle station, and to the left we have a glimpse of a wide and beautiful landscape. The eye travels across the Clyde valley, with its orchards and woods and towns, to where the stormy mountains of Douglasdale sentinel the graves of a great race. Far away in the west a cloud, distinct in its outline, looks as if some giant were rearing his head above the horizon to peer over the Vale of Clyde. It is Loudon Hill; and the sight of it recalls memories of Bruce and Wallace, who each fought under the shadow of that strange peak, and of the Covenanters, who triumphed there at Drumclog. Sir Walter Scott has told in sounding words the story of that later battle, and of the duel between Bothwell and Balfour of Burley in the morass: "Then a bed of heather or a thousand merks!" said Bothwell, striking at Burley with all his force. "The sword of the Lord and of Gideon!" answered Burley as he parried and returned the blow.

Whilst we are remembering these things the train flashes across a bridge, and beneath we have a glimpse of a narrow road winding down into the valley. To me it is a pathway of desire. Often have I followed it in the witchery of the morning and accompanied by memories of the great Sir Walter. For not far down that road, set on a peninsula round which Clyde rolls its dark, foam-flecked waters, is the house of Milton-Lockhart.

It was in 1828 that William Lockhart acquired the estate of Milton, which, to distinguish it from other Miltons, he called Milton-Lockhart. The mansion-house being old and damp, he proposed to erect a new one; and it was his pleasant fancy to invite Sir Walter Scott to come and choose the site where it might be built. So in January 1829 Scott came, accompanied by the brother of the laird of Milton-Lockhart, John Gibson Lockhart, his son-in-law and biographer. They spent a long while sauntering about the estate, though Scott was far from well, and had need of John Lockhart's arm. He selected a fine site, however, — a plot of rising ground, with a lovely view of river and valley to the south-east; while behind it the land rises toward Carlisle in a green background of beech and birch and thorn. Two years and a half later—in July 1831—Scott returned to Milton-Lockhart and spent there a night. He was then engaged writing his

last published novel, and he drove with John Lockhart down Douglasdale, saw again the fragment of the old castle, which is the Castle Dangerous of his story, and stood musing in the chapel of St Bride beside the monuments of the dead chiefs. Then they drove over by Lesmahagow to the banks of the Clyde, talking as they went of unhappy things. Of the pages in his *Life of Scott* where Lockhart describes that drive and the events preceding it, Andrew Lang wrote that they 'surpass all other achievements of biography.' This was Scott's last journey into Lanarkshire. He returned no more that way, for he died next year (1832).

It was in or about the year 1890 that I first observed these dates. I had read by then every one of the novels, beginning when I was a boy of ten with *Ivanhoe*; and in that year I read Lockhart's *Life* for the first time. I noted that Scott was at Milton-Lockhart in 1829 and 1831, and I learned further that John Gibson Lockhart had spent some summers there down to 1854. It seemed to me that, since only thirty-six years separated me then from Lockhart, there might be some folk living in Clydesdale who might remember that yellow Spanish face and the glint of those gray eyes. Nor was I disappointed. In Carlisle and the region round about were people who had seen or talked with Lockhart when he was resident in his brother's house beside the river.

A gap of thirty-six years is comparatively not too long for one memory to span. Thousands of middle-aged people have quite clear recollections of a fascinating somebody encountered thirty-six years ago; but the spaces of sixty-one and fifty-nine years which separated me in 1890 from Scott's two visits to Clydesdale appeared to me unbridgable. Besides, these visits were only of a few hours each; so that I had no thought of meeting any one who had met the great Sir Walter at Milton-Lockhart. But the unthought-for arrives. To my intense joy, I happened upon a man who remembered. His name was James Purdie, and he lived in a cottage a little out of Carlisle. When I was taken to see him we found him sitting in the yard surrounded by dogs of a terrier breed, which he looked after for his grandson. He was one of those fine old men whose natural force remains unabated, and who possess every faculty to the last, as if disease and decay had forgotten them. He said he was 'over ninety'; but I suspected he might be a year or so short of that. Still, he was a wonderful old man.

One of the dogs got into mischief at the other end of the yard. He picked up a pebble from a little handy heap beside him and flung it. The dog yelped. I could not help remarking that it was a rare thing for an old man to fling a stone, and with an aim so true. 'Man,' he said, 'I ne'er had toothache in my life, nor rheumatics; an' I can see to read sma' print better then my ain great-grandweans.'

With very little coaxing he told me about his meeting with Sir Walter Scott. He had been a travelling clockmaker in his youth, and his story was that he had been employed that January day of 1831 repairing and setting up one or two clocks which had been recently brought to Milton-Lockhart. I surmise that this was part of the preparation made for Sir Walter's visit, and that Purdie, according to the immemorial custom of tradesmen, had been behindhand with his work; so that when the carriage drove up with the distinguished visitors he was still busy with his little wheels and pinions.

'Were you wanting to see him?' I asked.

'Was I no? We a' wanted a keek at the Tillietudlem-man.'

This is quite likely. Tillietudlem—Craignethan Castle, which is on the other side of the Clyde almost opposite Milton-Lockhart—was attracting streams of visitors in 1831, as it is to this day. The incident of Jennie Dennison flinging the hot kail-brose on her sweetheart, Cuddie Headrigg, as told in Chapter xxv. of *Old Mortality*, was one likely to appeal to the humour of the Jennies and Cuddies in the servants' hall at Milton-Lockhart, so I had no difficulty in believing that they all wanted to see the teller of such glorious tales—the Tillietudlem-man.

'And you saw him?' I said to Purdie.

'I did that. No' when he arrived, but a wee while after. I was cleanin' the escapement o' ane o' the clocks at a wee table when he cam.' He had been ootbye, an' looked gey tired. He jist drappit doon in the first chair he cam' to.'

'What was he like?'

'Man, he had a face like a haggis!'

This shocked me. My sense of what was due to my hero was outraged.

But Purdie was adamant. He would not alter for me the oft-told story of sixty-years since. 'A face like a haggis,' he repeated, 'wi' jist as muckle expression in't—like it or no' as it suits ye.'

Perhaps, after all, it was true. Those were Scott's 'apoplectic days.' He was tired; he was ill. 'The minstrel was infirm and old.' So I hastily jotted down in my note-book the information I had got, and began to fish for more.

'Did you hear him speak?' I asked.

'Did I no! Man, we had a crack thegither, him an' me. Ye see, the chair he sat doon on was jist beside me, an' I'm thinkin' he couldna be near anybody without talkin' to them.'

'Do you mind anything he said?'

'Mind! Af coorse I mind. I mind it a'. Ye

see, I was in Lanark next day, an' Mr Mingies, the minister, garred me gang through it a' to him; an' then Provost Hutchison had me into his shoppie, an' him an' twa-three mair speered me a' about Sir Walter, for they were rale ta'en up about him. Sae that fixed it in ma mind like.'

'Well, then, tell me.'

'Oh, he began about clocks. "Maister Peevot," he says, "why does a clock warn?" "Peevot" was the name clockmakers gae'd by in thae days, jist as we ca'd a cobbler a "Souter."'

'So he asked you why the clock warns three minutes or so before it strikes?'

'Ay; an' af coorse I let him see hoo it was, frae the ane I was workin' at. He listened, but he didna listen unco weel.'

It is possible, I think, without undue speculation, to follow Scott's thought. A few months before, he had suffered two apoplectic seizures. He did not hide from himself what these portended. He was aware of something pending. On New Year's Day of that very year (1831) he had written in his *Journal*: 'I have had a paralytic touch. I speak and read with embarrassment, and even my handwriting seems to stammer. This general failure,

With mortal crisis doth portend
My days to appropinquate an end.'

The lines are from *Hudibras*, and it was characteristic of that brave heart to round off these two sentences of dolour with a quotation from the great comic poem. But thus we see that he knew the meaning of these portents. Perhaps on the night before that visit to Milton-Lockhart, which he had spent at the inn of Douglas Mill, he had heard in the dark of the midnight one of those tall old clocks 'warn' as the machinery put itself in position to strike the hour, and had thought how he had himself been warned, and that he was waiting for the hour to strike.

'Well,' I asked Purdie, 'what else?'

'Weel,' he replied, 'when I had tell't him about the wye a clock warns, says I to him, "Here's something in your line, Sir Walter." An' wi' that I whuppit aff the dial sae that he could see the foreplate. Noo the clock waana a new ane. It had been in a clockmaker's haun' afore, an' the chap had scratched something on the brass foreplate—as young Peevots wud whiles dae. I thocht it wud interest him, sae I let him see it. He couldna read it; nor did he try. He was ower blin', but I tell't him whit it was, for I was aye a guid reader.'

'What was it?'

'Jist twa lines o' a sang—naething mair. It wud ha'e been rale nate if they had been his ain, but they werena. They belonged to as guid a man, though, an' that's Rabbie Burns:

I will loe thee still, my dear,
While the sands o' life shall run.'

'What did he say?'

'Oh, he gied a bit laugh. "That's no' bad,"

says he. "It mixes Love an' Time thegither. It's a fine text for a clock. I wunner wha the sentimental Peevot was?" says he; but I could gie him nae licht on that, for I didna ken masel. I was gaun to pit on the dial again, when he says to me, "That's ae curiosity, an' here's anither." An' wi' that he gied me ower the stick he had in his haun'. "Whaur wud that grow, think ye?" says he.

'I tuk a luk at it. "Gin ye tell't me whaur ye got it, Sir Walter," says I, "I micht guess." "I got it frae a Hielander," says he. But wi' that in comes a gentleman to say that they were waitin' for him, see up he got. I gied him back his stick, an' he hirpled awa'. I saw him nae mair that day, an' I never heard anither word about the stick.'

I regretted that I could not give Purdie any information about this. Scott's stick, which he evidently regarded as a curiosity, is not mentioned in his *Journal*, nor in Lockhart's *Life*, nor in Skene's *Memories*. Probably, however, it is one of those preserved at Abbotsford, or that in Darnick Tower near at hand.

In Lockhart's *Life* we read how Scott spent the rest of that day. Soon after he left Purdie, as I take it, dinner was served. Among the guests was Mr Elliott Lockhart of Cleghorn and Borthwickbrae. He, like Scott, had recently been stricken with severe illness, but had recovered. They were old friends, glad of the chance to meet, afraid perhaps that it was for the last time. 'Each exerted himself to the utmost,' says Lockhart—'indeed, far too much.' The laird of Cleghorn drove off to his own house in the evening, a distance of about eight miles. On reaching it he fell down in a fit, from which he never recovered. When next morning this sad news was brought to Scott at Milton-Lockhart he announced his decision to depart instantly, though it had been his original intention to remain two days. 'No,' he said, 'this is a sad warning. I must home to work while it is called day; for the night cometh when no man can work. I put that text many a year ago on my dial-stone; but it often preached in vain.'

In that great and heroic saying may we not trace lines of thought suggested by the talk with Purdie overnight? He had seen then an inscription on a clock, which may have made his mind turn the more readily to that on his own dial. And there is here again the suggestion of a warning. The clock was all but striking the hour of release; the night was coming. But first there was work to do, and he left Milton-Lockhart in haste to do it.

I asked the old man Purdie if he remembered anything else.

'Oh aye,' he replied. 'I bided aboot the hoose that night. I sleepit in the stable-laft, an' I gied a haun' at yokin' the horses in the mornin'. When Sir Walter was comin' oot I gaed doon amang the servants that were staunin'

aboot to see the last o' him, an' he saw me amang them an' cried me ower to him. "We didna feenish oor crack yestreen," he says; "we'll no' feenish it noo." An' then he speered me ma mame. "Purdie!" he says. "I ha'e reason to ken that name." An' he put a shillin' in ma haun'.'

'If you had that shilling now I'd give you ten for it.'

'I daursay. Mony a man I've tell't the story to wud ha'e dune that. But it gaed awa' frae me faster than the Clyde rins below its brigs. I spent maist o't in Crossford, an' the rest in Kirkfieldbank, that very mornin'. For Sir Walter drave through Lanark, an' I walkit on there after him. They saw him pass through, an' when I cam' up, an' they heard I had had a crack wi' him, they were a' at me to tell them aboot it. I could ha'e sell't the shillin' then if I had had it.'

'And is that all now that you mind about him? Tell me, did he look frail as he got into his carriage?'

'Ay, he did that; but a' the same he was in a steve hurry, an' alippit as they haunted him in. There was a mason chiel there, an' I heard him cry, "Canny, Sir Walter! canny!" an' that's the last I heard.'

So Scott drove off that July morning across the new bridge, which he had praised because it had 'ribs like Bothwell,' and away among the apple-orchards of the Clyde, past Stonebyres Falls with its thunder, and up the hill through Lanark; while later in the day his humble, brief acquaintance, James Purdie, trudged along the same way, visiting the inns as he passed, and claiming the attention of the *literati* of the countryside because he had talked for five minutes with the Wizard. 'Adieu, Sir Walter, pride of all Scotamen! Take our proud and sad farewell.'

There need be little doubt, I think, as to the identity of the 'mason chiel' in Purdie's story. He could not be any one but John Greenshields. This man was living then with his parents on the Milton-Lockhart estate. He was a working-mason, but was a genius with his chisel, and his sculptures have an abiding place among the masterpieces of Scottish art. Scott was greatly interested in him. In his *Journal*, under 18th January 1829, he wrote: 'We went, the two Lockharts and I, to William's new purchase of Milton. We found on his ground a cottage where a man called Greenshields, a sensible, powerful-minded person, had at twenty-eight (rather too late a week) taken up the art of sculpture.'

This cottage was on the other side of the river; and as the bridge was not then built, they were rowed over in the ferry-boat by Betty, the sculptor's mother, a remarkable woman, tall, comely, hale-hearted, decked in the whitest squinty mutch ever seen, who would not permit her son, nor anybody else, to row Sir Walter

across the Clyde. Greenshields himself was waiting for them on the other bank, and conducted them to the thatch-covered wooden shed which was his studio. Scott was greatly charmed with the man, with his broad Scots tongue, his humour, his frankness, and his way of drawing his lips into a grim, involuntary whistle. He remarked, 'There is much about that man which reminds me of Burns.'

Greenshields had gone two or three days before to the Earl of Elgin's place at Broomhall, in Fifeshire, and on his arrival there had been told that Scott was on the way to Milton-Lockhart. He at once set out on the return journey, having been barely an hour at Broomhall, and arrived home in time. When they met on the river-bank, Scott expressed regret that the visit to Fifeshire had been so short, and lamented the young sculptor's loss in not being able to examine the works of art which the earl possessed. 'Nae loss at a', cried Greenshields in his rapid way. 'I saw everything, and see everything yet.' 'Indeed?' remarked Scott. 'Yes,' said the other in a droll way; 'ye maun mind I've a deevilish greedy e'e.'

On the occasion of the second visit, in 1831, Greenshields met Scott again. In the interval the former had grown famous, for his statue-group of the Jolly Beggars had been exhibited and applauded in Edinburgh. The figures were original; they were true. They were the work of a man who, like Burns himself, was of the soil, and owed no debt to any school or master. It was then universally admitted that here was the man who could transfer in living stone to future ages the features and form of the greatest of Scotsmen, whom all men knew to be fast approaching the limit of his mortal span. So, when the two men met once more at Milton-Lockhart that July day of 1831, there was in the sculptor's mind the thought of the task tacitly assigned to him. 'Greenshields was at hand,' writes Lockhart, and he [Scott] talked to him cheerfully, while the sculptor devoured his features as under a solemn sense that they were under his eyes for the last time. Next morning at the hour of departure, as I would gather from what Purdie told me, Greenshields, 'the mason chiel,' was either helping Scott into his carriage or anxiously watching, and his 'Canny, Sir Walter! canny!' was the farewell of those two leal and great-hearted Scotsmen.

How great the pity is no 'sensible, powerful-minded person' like Greenshields, to whose warning he would listen, was beside him to cry, 'Canny, Sir Walter! canny!' when he was entering upon those fatal speculations which eclipsed the brightness of his day and burdened his later life with a titanic task! Yet the words might well have been addressed to Greenshields himself. He, like Scott, overworked himself. He was not 'canny.' He produced, indeed, many fine statues; one notably of Sir Walter, the *Sic Sedebat* statue, which pleased

Lockhart, and is now in the lower Parliament Hall (Advocates' Library), in Edinburgh. Another is that which is familiar to all who know the Western Highlands, and which, we may be sure, the 'Author of *Waverley*' would fain have seen—the statue of Prince Charlie by Loch Shiel, where, carved in stone, the Young Chevalier stands gazing up Glenfinnan, as if hearkening to the pibroch of Lochiel.

But these and many other labours brought too soon the end. In the year 1835, at the age of forty, in the little cottage at Milton-Lockhart, John Greenshields died. The last effort of his genius had been to execute a model in clay for the Scott Monument in Glasgow. It is a fine piece of work. The figure stands erect, one foot slightly advanced, the left hand grasping a book, the right arm and shoulder wrapped in a shepherd's plaid; but it is declared that the position of the plaid is quite wrong, that it ought to be thrown over the left shoulder. When the objection was first stated, Greenshields, who was then on his deathbed, positively stated that he had seen Scott wear it thus—over the right shoulder—on the morning he departed for the last time from Milton-Lockhart, and Greenshields had a 'devilish greedy e'e.' It is said that he died in the very act of vindicating himself on this point to a visitor, and the rumour went about that this matter of the plaid killed him. Probably the energy with which he was debating the matter blew out the fainting flame of his life.

Another hand—Ritchie's—cut in stone the statue itself which stands now, colossal, impressive, on the eighty-feet high column in George Square, Glasgow. The original clay model which Greenshields fashioned is still in existence. One of his grandsons, when a child, could not refrain from giving the nose a light tap with a hammer, which slightly flattened the tip; otherwise it is undamaged. It rests now in a house beside high Cairn table, not very far from the road along which Sir Walter Scott and John Gibson Lockhart drove when they came into Lanarkshire, visited the tombs of the Douglasses in St Bride's, and saw for the last time together Clyde's waters sweeping round the green knoe at Milton-Lockhart.

SONNET.

BEFORE me lies the opalescent sea,
Full-tide and almost motionless, and on its breast
Blue islands float in evening's quiet rest;
And evening's calm enwraps all things and me.
Here, for a space, from noise and hurry free,
I linger, and let Fancy weave that chain
Of golden links which she will draw again
Into her shadowy realm of mystery.
Oh golden chain!—not strong enough to bind
The dream-life to this present, false to true,
In fair reality—how soon your gleam
Fades and is lost in shadows of the mind,
As sea and sky and wooded islets blue
Melt into night, and lost in darkness seem!

CLARA SINGER POYNTER.

Chambers's Journal

SEVENTH SERIES

PRISON TREATMENT OF CRIMINALS.

By the Hon. Lord GUTHRIE.

THE treatment of crime cannot be airily dismissed by the obvious truism that it is of infinitely less importance than the problem how to stop the supply of criminals. On that problem I shall only state the conviction that—when followed back to its sources, beyond the plausible but superficial causes of drink and gambling (effects as often as causes)—it will be found to lead ultimately to insufficient wages, unemployment, and destitution. 'My Lord, I never had a chance,' was the plea once addressed to me by an old convict. I felt it was probably true, and that, although unavailing here, it would one day not pass unheeded at a Higher Tribunal.

But in view of the convictions for crimes and offences in Great Britain and Ireland in 1911, amounting in all to the huge total of eight hundred and fourteen thousand and fifty, it is not unnatural that there should be no subject, outside party politics, more often discussed. The question amounts to this: how are we to deal with the men and women who appear once, or it may be a hundred times, in our prisons, with the result that not only is their labour withdrawn from the market, and they themselves in many cases made permanently unable and unwilling, or at least less able and less willing, to work, but their support, and that of their families, meanwhile falls on the country?

The theme lends itself to picturesque writing and to lurid and exaggerated statements. For instance, Oscar Wilde's famous epigram, 'Every sentence is a sentence of death,' is disproved by the fact that the great majority of those convicted for the first time are never convicted again. Then, again, capital is often improperly made, off the stage and on it, of stale horrors now happily unknown in modern jail treatment; and the fact is ignored that the present criminal administrators—Prison Commissioners, prison officials, and criminal Judges—are as conscious of the defects of the existing system as any of its severest critics; and that they are year by year, so far as totally unsuitable buildings and inadequate funds will allow, introducing improvements in the line of modern views on the treatment of crime.

On no subject is there at once more complete agreement and greater divergence of opinion.

No. 124.—Vol. III.

Convicts who have recorded their experiences from so many different points of view—Oscar Wilde, Michael Davitt, Lord William Nevill, Jabez Balfour—equally with experts in criminology, exempt the administrators of the law from personal blame. And convicts and experts agree with Judges, the police, and prison officials in condemning the present system, in so far as it makes many of the men and women with whom it deals less fit to be at large when they leave jail than when they entered it. Mr Tighe Hopkins, in his sympathetic and suggestive book, *Wards of the State*, published this year, does not exaggerate when he states as the general opinion: 'Imprisonment of the conventional and old-fashioned sort is an unmitigated failure, and real remedies or substitutes may be very difficult to arrive at, but the absolute defectiveness of imprisonment as imprisonment is an outstanding fact. Its failure is the same in all countries.'

There is also substantial agreement as to the lines on which the present system can be improved. All approve what has been already done in many prisons and penal settlements in the way of increased classification; substitution, as a means of discipline, of rewards for punishments; reduction, or still better abolition, of the preliminary period of solitary confinement; increase in the amount of combined labour; improved dietary; physical drill; introduction of less monotonous employments; more teaching of trades; better libraries; more frequent letters and visits from friends and relatives; Brabazon classes and Bible classes held by lady visitors for women; larger cell windows; improved artificial light for reading in the evenings in the cells; occasional lectures and concerts. By these changes and many others it has been sought in recent years, step by step, to deprive the system of some of the features which make it destructive of that self-respect and that respect for others without which decent living and independent support on liberation cannot reasonably be expected. There are prisons where the prisoners are encouraged to have photographs of their children or mothers or wives or husbands in their cells, with marked good effect. In a Scottish prison I was told that some of the most troublesome women in it were

[All Rights Reserved.]

APRIL 12, 1913.

softened to tears when coloured prints of happy domestic fireside scenes were put up in their cells. Thirty years ago a man of education and refinement, whom I knew, was sent to penal servitude for fraud. He petitioned for only one favour—that he might be allowed to retain his children's pictures. The governor of the prison, a most humane man, told me that he had been compelled by the rules to refuse the request. I replied that the refusal seemed to me as brutal as any 'Turkish atrocity.' In some prisons personal decency has been stimulated by a mirror in each cell—a small round of silvered glass, rather wavy, let into the wall. I saw a woman in one of these prisons who, in a fit of temper, had smashed every pane in her cell window; *but the mirror remained intact!* In the kitchen of an Irish prison the governor pointed out an active, intelligent-looking woman busily employed. She had been the terror of the place, and had gone through the whole round of possible punishments. At last it occurred to the despairing matron to try her in the kitchen, the goal of ambition for most prisoners, male and female. The change acted like a spell. It turned out that she had a genius for cookery! She was interested in her work, and she ceased from troubling.

It may be said that all this is only putting new wine into old bottles. But in this case there will be no cause for regret when the bottles burst and prisons give place to industrial colonies, and the present unsuitable buildings and inadequate grounds, often in the centre of towns, are abandoned for buildings in the country, constructed on rational principles and surrounded by considerable areas of ground.

On the question of what is to replace the present system, the difference of opinion is endless. But, whatever the new system may be, it is clear that large initial expenditure will have to be incurred. It is doubtful if the country is as yet prepared to find the money. Hence the great importance of having the whole question thoroughly discussed, so that public opinion, which controls the nation's purse-strings, may become convinced of the necessity for this expenditure.

The present prison buildings and grounds are arranged with a view, not to the reformation of the reformatable and the permanent detention of the unreformatable, but to the carrying out of our forefathers' pseudo-theological idea of retributive punishment, which has now been universally abandoned. 'Vengeance is mine; I will repay, saith the Lord.' The places are admirably adapted for punishment, but they lend themselves neither to reformation nor to deterrence. Under the new system, whatever be its details, there must be establishments for the temporary detention of those who are reformatable (and that for sufficiently long periods to give reformative methods a fair chance); and there must be other establishments

for the permanent, or indeterminate, detention of those who, by a long and continuous course of crime, have shown that crime is their settled employment. In the establishments for the reformatable there must be ample space for the separation of offenders who, although not professional criminals, are comparatively hardened from those not yet inured to crime. And there must be space for outdoor work, and buildings in which trades can be effectively taught. In the establishments for the permanent, or at least the indefinite, detention of the irreclaimable, the conditions will be as humane as is consistent with the safe detention of the inmates, remembering the motto, 'All unnecessary pain is cruelty.' Whatever the precise conditions are, they will be radically different from the present conditions in convict prisons. The saying is epigrammatic, and therefore not scientifically accurate; but there is a basis of truth in the statement about the inmates of our existing jails, that one-half should never have been let in, and the other half should never be let out.

It is objected by some that the new methods already adopted, and still more the proposals I have indicated, will eliminate the idea of deterrence from the treatment of the criminal. I have even heard it said that prisoners are happier in jail than elsewhere; and I am astonished to read in the English Prison Commissioners' Report for 1910-11 this sentence in the chaplain's report on Maidstone Prison: 'The remarks of a recent visitor bear out my observations on conduct and disposition: "The thing that strikes me most of all is the appearance of happiness of practically every single man."' Happiness of practically every man in jail! I wonder if people have the least idea of what detention in prison means to the ordinary prisoner! Let them try in imagination to realise something of the sudden monotony, the silence, the loneliness; never to laugh or hear another laugh; never to speak except in monosyllabic answers, or by way of complaint or about the necessary details of work; a life without volition or initiation, even in the smallest details; supervision watching every movement and dogging every footstep—in a word, degradation from manhood and womanhood to childhood and slavery, from personality to a number; and all this going on, with cumulative effect, from day to day, from week to week, from month to month, from year to year! If people knew anything of what this involved, under the kindest administration, they would talk less about prisoners being coddled or prisons being made too comfortable. They would not blame the American State Governor who wished to know what life in prison amounted to. He signed an order for his own incarceration, as an ordinary prisoner, for a week. At the end of twenty-four hours of solitary confinement he begged for paper, pen, and ink; and having got them, he wrote and signed an order for his own

immediate release! They would understand also the emotion of a convict of the order glibly described as 'hardened ruffians.' A prison visitor said a friendly word, and shook hands with him. The man burst into tears. The visitor looked surprised; and the 'hardened ruffian' explained, 'Nobody has shaken hands with me, sir, for nine years.'

If it be only meant that the prisoners are better housed, better fed, better clothed, better supplied with literature and religious services than many of them would be outside, this is true. But the criminal's idea of enjoyment is not associated with any of these things, but with 'wine and women,' superfluity and variety of food, tobacco, sport and sporting-papers (*not Chambers's Journal*), gambling, society, all of which, within prison walls, are conspicuous by their absence. Increase the comforts of the jail; give the prisoners down beds and French cookery; fill the prison library with all the spiciest literature; provide daily magic-lantern lectures and cinema shows. Then open the prison doors. In less than five minutes, save for the officials, the building will be empty! Test the alleged mistaken leniency of the so-called 'humanitarian' proposals of the present day, involving as they do lengthened sentences and hard work for the reclaimable, and for the irreclaimable permanent or indefinite detention. Explain these proposals to the present-day short-sentence prisoner or to the convict in a penal settlement, and enlarge on the many alleviations and ameliorations which are proposed. The prisoner and the convict will tell you they prefer the present system. A penal settlement warden told me he had explained these new 'humanitarian' proposals to an old convict. The reply was that he wanted neither to be reformed nor deterred. He wanted to get out. The safety of the community did not appeal to him. But he added, 'If what you say comes true, I tell you what will happen—it will mean murder for you, and then suicide for me.' When I visited Borstal, near Rochester, well known for the great experiment being carried on there on so-called 'humanitarian' lines for the reformation of young male prisoners and convicts, I was struck by the evidences of discipline and hard work. No doubt the lads get ordinary food; they occupy rooms, not cells; they play games, and at certain periods of the day they are allowed to talk. Yet, just before my visit, one of them had deliberately destroyed his mattress *that he might be sent back to the comparative idleness of an ordinary prison!*

Obviously, as an integral part of the system that is coming, there must be adequate preparation for safe liberation by the teaching of trades and by moral instruction; suitable employment must be found for those returning to the world; and there must be efficient supervision after discharge. The present system looks to the physical well-being of the prisoner while he is in confinement, and does it well. Our prisons would rejoice the hearts of John Howard and Elizabeth Fry. In the industrial colonies which are going to supersede them, the first consideration will be to limit, so far as possible, the number admitted to detention. Time will be given for payment of fines, and other means will be used to obviate the seclusion of those for whose offences a fine was deemed the appropriate and adequate treatment. The second will be to put aside those offenders who must be dealt with as irreclaimable (subject to periodical revision of the classification), taking care, as already mentioned, that their lives under detention are rendered as endurable as is consistent with their safe permanent seclusion. The third will be to use every endeavour to render the remainder, at the earliest possible moment, physically, morally, and mentally fit to live honest lives in the world outside; and the final consideration will be to see to it that on liberation suitable employment and safe friends are found for them.

And what of the feeble-minded, the woefully large class, outside the classification of reclaimable and irreclaimable, to be found in larger or smaller numbers in every prison and convict settlement? Owing to their deficiencies, such poor creatures have never been eligible for industrial schools, or for reformatories, or for institutions on the 'Borstal' system. Yet in the criminal courts we are compelled to deal with all offenders who are not actually insane on the footing that they are of ordinary intelligence, and have made a deliberate choice of evil; although a large number of them are both mentally and physically deficient, and their wrongdoing may be almost the necessary result of their circumstances. That is a part of a very large question which must be faced soon, and the sooner the better. It may be that when segregation of the feeble-minded comes, as come it must, the country may be willing, as a first step, to deal with those in whose case (without their being professional criminals) unfitness for the duties of citizenship and marriage is not matter of opinion, but has been proved by frequent lapses into crime.

ATLANTIC GOLD.

CHAPTER VIII.

HELMSDALE'S weariness was patent at dinner that night; his liveliness in talk was plainly an effort. More than once, over his coffee and cigarette, he nodded. For the first time since Arcus's advent he did not request his niece to play to them. He asked her, however, for an account of the afternoon on the Other Island. She made the most of it, as though afraid of hurting his feelings. He listened with half-closed eyes.

'You were interested, Arcus?' he said lazily.

'Deeply interested, doctor. I was fascinated. And your tuning theory'—

'Ah, my tuning theory! I suppose Miss Florence has explained that very fully to you?' His irony was kindly, and he smiled at his niece. 'Well, when I have time I shall give you a dissertation upon my tuning theory. It involves a new combination of forces.' He yawned. 'There is something in it, Arcus. If I don't live to bring it to practice, somebody else will.' He sat up and finished his coffee. 'Florence, tell Hubert to bring me a pint of this at ten o'clock.' He rose, giving himself an impatient shake.

'Uncle Victor,' the girl cried, 'you are not going to spend another night in the laboratory?'

From the door he smiled at her again, this time a trifle grimly.

'The devil drives, my dear. The work is heavy and urgent. Don't worry. I may not be very late. I promise you to turn in at the earliest possible moment.'

With a courteous inclination to his guest, he opened the door and disappeared.

'There is something wrong!' said Florence half to herself.

'He is tired,' said Arcus, 'and you are worried. I suppose there is nothing I can do to help either of you?'

She shook her head. 'He is overwrought. If only he could be persuaded to leave Laskeir for a time—a month even'—

'You would not like to ask him to do that, Miss Helmsdale?' said Arcus. 'Well, there is no reason why he should listen to me; indeed, he might naturally enough regard such a suggestion from me as an impertinence. Still, I have been his guest, and that entitles me to ask him to be mine. To-morrow I will try to persuade him to bring you to London at the first opportunity. I can put forward as a reason for my being urgent the possibility of floating that gold recovery company of which you have heard him speak. Then I could offer to introduce my friend Anstruther, who understands

such matters, and so on. Do you think my idea worth trying?'

'Yes, I do,' she replied. 'And yet,' she sighed, 'he is not really so interested in the gold at present as in the colour-photography. Still, you will do what you can, won't you, Mr Arcus?'

He gave his assurance, and, lest she might not desire to talk, begged for some music. After a moment's hesitation she went to the piano. She played two of Chopin's nocturnes, began a third, broke off with a short laugh, and passed to the window. Drawing back the curtain, she stood silent, her face to the night.

On an impulse, Arcus said, 'Might we not go out for a little while?'

And, somewhat to his surprise and much to his gratification, she answered simply, 'Yes, if you wish.' Her voice was calmer than her spirit, for the latter was crying passionately, 'Why not—why not?' Out there the moon, waning, yet still wonderful, the multitude of stars, the illumined sea, all seemed to echo, 'Why not—why not?' She had watched them so often alone, alone with her girl's hunger of desire and ache of longing, those silent friends of her solitude. And now they spoke. They knew she was no longer alone, even as she knew it. For a moment the white moonlight seemed to scorch her face, the starshine to dazzle her eyes, the still sea to deafen her ears. She was no longer alone. She would never be alone any more. In time to come she would have at least a memory for a companion. Moon and stars and sea, and the soul of a girl with its love warm and sweet and ripe for plucking—there they were on that September night, asking the old question which is never answered: 'Why not—why not?'

'A beautiful place to live in!' he murmured as they stepped out of doors.

'Yes,' she assented quietly. A little while ago she would have added, 'But you have seen it at its best.'

'I shouldn't worry about Dr Helmsdale, if I were you,' he continued gently. 'It's a poor sort of man that doesn't get tired now and then.'

'I'll try not to worry. Indeed, I don't know why I should worry. He is quite a young man still, Mr Arcus.'

'That is better,' said Arcus. 'Now, where shall we go? You would not care to risk the way to the cliff to-night?'

'It would take us too long,' she said, a little more primly than she intended. 'There is only the beach and the lookout.' They were almost at the rough steps.

'The lookout! Shall we go up and watch for a ship?'

'A ship! Of course, Mr Arcus.'

Once more he was chilled.

Soon they were standing together in the recess. There was little enough room for two people at all at variance.

Arcus drew a long breath. 'What an exquisite night! And we might be alone in the world! Miss Helmsdale,' he inquired, 'are you looking for a ship?'

'I always look for ships when I come up here. Are you not looking for one?'

'No. Do you want very much to see one, Miss Helmsdale?'

'If the yacht is not due'—

'I mean any other ship—the ship that will take me away from Laskeir. Do you want it to come now?'

She gave a small, sweet laugh. 'There is common politeness even in Laskeir, have you not noticed, Mr Arcus? But you—you are anxious about your friend in London?'

'That is so. Yet I don't want to leave Laskeir.'

'That is nice of you. Still, your friend comes first. You would soon tire of living on a tiny island like this,' she added irrelevantly.

'This tiny island holds all I want,' he said, not quite steadily. 'I should like to return to it. I—I should like your permission to return to it—soon.' He looked at her, waiting her reply.

Her eyes were set seaward. 'I'm sure we should be very glad to see you at any time, Mr Arcus.' The words were conventionally spoken, but the last one left a quiver at her lips. He saw it, and the desire for her overwhelmed him.

'My ship may come at any hour,' he said. 'I can't go without telling you the truth. It can't matter to you now; but, if you will give me a chance, I will try to make it matter some day. The truth is that I—love you.'

There was a silence. The girl's hands tightened on the rocky parapet.

'Florence, will you give me the chance to teach you the truth of it? I've told you some things about myself; but of course you don't really know me—your uncle doesn't know me. Still, I ask for a chance'—

'You don't know anything about me,' she said in a low voice.

'I know that I love you, Florence!'

Still she looked seaward. But now the moon made pallor on her face, and the stars were drowned in her eyes, and the only sound in her ears was the music of her own name—'Florence!—so sweet to say, so sweet to hear. And suddenly she hid her face in her hands.

For the space of a long breath the man stood motionless, regarding the bowed, dusky head,

the moonlit hands and neck. 'God! is it possible?' he said under his breath. 'Florence—dearest!'

'Oh,' she cried faintly, 'is it the truth?'

'It is the truth,' he said huskily, 'whether it matters to you or not.'

But he knew that it did matter. Was not her pretty, bowed head her confession? With a sigh that may have been a prayer, she yielded herself to his arms.

CHAPTER IX.

IS a man ever too happy to remember his tobacco? At two o'clock in the morning, Arcus, seated at his bedroom window, fully dressed, fingered his empty cigarette-case while he dreamed of Florence and hugged the joy of possessing her. Out there in the amorous moonlight he visioned her again, feeling her close to him in the cramped, blessed space of the lookout, hearing her whispers shy and warm and sweet as the airs of that calm night. No thought of the morrow, save that the morrow would bring her once more to his ears, his eyes, his lips. No thought of what he should say to Helmsdale; for Florence had begged for secrecy until her uncle should be persuaded to take a holiday, and he had agreed readily enough, foreseeing difficulties that a little time in London might overcome. No desires save the one for Florence herself, and the other—subconscious, no doubt—for a cigarette.

The mere action of rising did not disturb his dream; it continued with him as he passed softly across the hall and into the sitting-room, where a single lamp still glowed above the pink chrysanthemums on the polished table; it remained while he filled his case from his host's hospitable, capacious, cedar-lined box.

But it was shattered—shattered like the fallen glass that noisily rang from the laboratory.

Startled, dazed, Arcus stood listening. Ere his heart had beat thrice there came to his ears a choking cry. It was followed quickly by the sound of a stumble, and thereafter a heavy thud.

Roused, he sprang to the door of the laboratory.

'Are you hurt, doctor?'

No answer. The door would not open. Arcus darted to the electric bell which he was aware would summon Hubert, and back to the door. Shoulderwise he threw himself against it. At the third assault it gave way. He plunged into a flood of yellow light. A pungent, acrid odour assailed nostrils and eyes. Above the bench whereon Helmsdale had once worked his 'magic' hung a little tawny cloud. For an instant the smarting eyes of Arcus, as he steadied himself, rested on the bench. He gasped, not altogether with the fumes; his face blanched.

Next moment he was bending over the man

who sprawled on the concrete, his feet among the fragments of a glass mask.

'Helmsdale !'

The inert body neither moved nor made sound. Seizing it under the arms, Arcus dragged it into the adjoining room just as Hubert, in shirt and trousers, ran in from the hall.

'Ah !' Hubert exclaimed, and that was all. With admirable promptitude he got brandy from the cupboard, a cushion for his master's head, and was down on his knees administering the spirit.

Arcus switched on the lights, and stood looking down helplessly at the grayish face. His own face was little healthier. There was a sort of horror—or was it fear?—in his eyes. He swayed.

At the movement Hubert glanced up. 'Take brandy, sir,' he said shortly, nodding toward the decanter on the table.

With a strong effort Arcus pulled himself together. 'I'm all right,' he muttered. 'Is he coming round?'

Hubert did not appear to hear. He dropped a little more brandy between the heedless lips, and felt for heart and pulse. Presently he nodded; two minutes later he smiled. 'So ! He comes back !' he said softly ; 'he comes back !'

Helmsdale spluttered, rolled his head, fought off some invisible thing with spread fingers, and tried to sit up. For a little while Hubert soothed him by word and touch, then signed to Arcus. Between them they set him in his easy-chair, where for several minutes he remained quite still ; only his eyes wandered about the room or wavered between the two men.

Of a sudden, 'Hubert, shut that door !' The voice was weak but wrathful.

'Yes, sir,' said Hubert respectfully, and closed as nearly as possible the damaged door. Returning to the table, he said, 'I'll give you a small drop more brandy, sir.'

Helmsdale made a slight gesture of refusal, saying he felt better. Certainly the ghastliness was passing from his countenance. He wiped his eyes, and spoke to Arcus. 'I am sorry to have disturbed you,' he said courteously. 'I thank you for your prompt assistance.' His expression became very kindly as he turned to his man.—'Hubert, I was hasty a moment ago. It is possible that you saved my life. To-morrow we shall talk'—

'Pardon, sir ; but Mr Arcus brought you out'—Hubert stopped short, and hurried to his master's side with the glass of brandy.

Helmsdale did not now refuse. Holding the glass unsteadily, he took several tiny sips, with long pauses between. At last, 'I thank you, Mr Arcus,' he said in a voice not his own. 'How did you'—He fell silent, his eyes on the floor.

Arcus found himself without words ; his eyes were downcast also. Hubert stood motionless, watchful, attentive, as one who simply awaits orders.

The hush was broken by the slight sound of the glass falling on the rug. Hubert promptly picked it up.

Helmsdale did not seem to notice that he had dropped it. He wiped his eyes again, and looked up, first at Hubert, then, a little furtively, at Arcus. 'Don't tell my niece,' he said.

'Very good, sir,' Hubert replied.

'Don't tell my niece.' The words were repeated, not as a command, but as a petition.

Arcus moistened his dry lips.

At that moment Florence entered the room. She had slipped a dressing-gown of apple-green silk over her night-dress. Her dark hair hung down in two heavy plaits. Her feet were bare. Bright fears looked out from her pale face.

'I heard something. What has happened ? Oh Uncle Victor !' In panic she flew to him.

He forced a smile. 'All right, Florence. I was going ahead too fast—mask got unfastened—whiff of the devil's own gas. But I'm all right now. Only a headache and smarting eyes. Don't worry, but—he paused—'thank Mr Arcus for coming to me at the right moment.' He followed this with a queer, short laugh, bitter, ironic. 'No,' he went on ; 'thank him in the morning. Run off to bed now. Or you might wait in my room, my dear, and bathe my poor eyes. I'll be with you in five minutes.'

The girl had turned to Arcus, and all at once her colour came back in a gust. He was staring at her in the strangest manner. Abashed, she went hurriedly from the room.

'In five minutes,' Helmsdale called after her reassuringly. He got up, steadied himself by the chair, and moved slowly towards the laboratory.—'You may go, Hubert.'

The man hesitated.

'You may go.'

Hubert bowed and departed.

Helmsdale turned at the door. 'Well ?' he said gravely.

Arcus was dumb.

'Good-night,' said Helmsdale at last. 'Whatever happens, I owe you my life.'

Moon and stars still shone and beamed on the placid sea, albeit their brilliance was failing. Dawn was at hand. Arcus, haggard and feverish, awaited its birth at his bedroom window. Stupefaction had given place to dull misery. His mind, not notably quick at its best, laboured, overloaded with its new ugly knowledge and hateful questions.

Three visions recurred persistently : the anxious countenance of his friend Anstruther. The scene in the laboratory ; the little tawny cloud hovering over the bench, and the objects on the bench. What were they ? A glittering machine he could not have described ; a silver slab on end ; intense yellow light ; sheets of pulpy-looking paper, one of them fuming slightly—all of them of familiar

appearance—scrip of the *New Atlantic Railway* / And on the floor the sprawling body of the Forger! The vision of Florence, with naked feet and eyes bright with terror—pure terror

born of intense natural affection! Truly he had much knowledge to bear, and many questions to answer.

(Continued on page 311.)

INSPIRATION IN THE TEACHING OF LOCAL HISTORY.

By G. M. FRASER, Public Librarian, Aberdeen, Author of *Historical Aberdeen*, *The Lonely Shieling*, &c.

PEOPLE may wonder sometimes if there is any sphere of human interest untouched by present educational methods. I hope to show that there is at least one—the teaching of local history in our schools—which has received not so much attention as it deserves, but which as a grounding in historical and geographical study is full of promise for the community. In what I say in this short paper I have Scotland specially in view; but it applies with even greater force to many parts of England and Ireland, where the ancient historical interests are in some ways still more definite and abundant.

It has been suggested that the teaching of local history to our children might tend to make them more parochial or provincial in their outlook. One can hardly think so seriously. Education in any subject cannot have a narrowing effect. And notice this, that local history is to be taught not as the sole history instruction given, but merely as a grounding; and also that you cannot teach local history in any adequate way without going far beyond your own locality and coming into touch with the larger things of the outer world.

Take one illustration of this. The children of every town know their own Town House, or their Market Cross, or some similar existing structure. In any one of these we have an admirable centre of interest for a class; and not merely in the history of our own Tolbooth or Cross, as the case may be, but as taking us to the civic history of other towns, even the older historical towns of the Continent. In the charter-room of Aberdeen there exists, in perfect preservation, a charter from Robert the Third, of date 1393, empowering the townsfolk to build a new Tolbooth, or Town House, anywhere *except in the middle of the market-place*. That seems a very odd prohibition; but even children see at once that that is not so when you tell them that in the old days it was very usual to build the Tolbooth in the middle of the market-place; that to this day the Tolbooth of Dumfries, where the original Jeanie Deans was confined, stands in the middle of the High Street, just where it widens out to be the market-place; and that the old Tolbooth of Edinburgh stood in the open space in the High Street, near St. Giles's Church. You find the same thing across the Border—in Keswick, for example; and it is one of the minor historical links that

bind us into one. A tolbooth was originally a booth for taking toll or collecting dues. In Wycliffe's Bible, Jesus saw a man 'sittyng in a tolbothe, Matheu by name,' where the Authorised Version has 'at receipt of custom,' and the Revised Version 'at the place of toll.' Hence the word came to mean guildhall or town house. The ancient local charters, priceless documents, ought to be seen by our children. They, and the structures or lands they refer to, or the ancient church or well or ruin at our doors, enable one easily to touch the young imagination of the child, and so to move from these concrete, familiar things into the very heart of our national history.

Take another point. The teaching of local history, properly gone about, will carry the children into interesting spheres of study that at present are undiscovered lands to them. The town of Dundee has on its coat of arms the pot of white lilies of the Virgin, signifying purity, and this and its old Church of St. Mary, now represented by its tower, remind the citizens of the ancient domination of the Virgin there, and of the old conditions throughout Scotland. Dundee was not unique in its pot of lilies, for one other old burgh (now merged in a larger town) had this as part of its coat of arms from a still earlier date, and for the same reason. It would be interesting to know if the children of Dundee have ever been taught to read the story of the town's coat of arms, or been taken by that fascinating road into the historical and religious interests of the country.

These old religious interests, one may say, are particularly rich in their associations, and may be made most engaging and useful to children. Not long ago I had the opportunity of setting an examination-paper in local history in Aberdeen to twenty-one lads of an average age of fifteen years, about a third of whom were secondary school pupils. One of the questions set was this: 'Who is the patron saint of this city? Why was he selected as the patron saint? Did the patron saint ever appear on the town's coat of arms?' The correct answer would have been: 'St. Nicholas. He was selected because he was the patron of seafaring people and seaboard towns like Aberdeen. He appeared on the seal of the town which was in use up till 1423.'

I regret to say this question floored every boy in the examination. Not one of them,

natives of the city, and in the ordinary way well educated, had ever heard of the town having a patron saint, although St Nicholas Church is the oldest, the mother-church, of the town, and the associations otherwise are not far to seek. When the fact was made known to them they became intensely interested, as children always are when their minds are brought into living touch with the things of the past.

Then in the sphere of place-names—in sad chaos in Scotland at present from lack of true scientific method—children may so easily have their interest usefully awakened. There is scarcely an old town in Scotland, from Inverness to the Borders, that has not Vennel as a street-name. At present to the thousands of our school children such a name has no significance. But some of them are alert immediately when you tell them this is *la venelle* of the French, meaning a narrow, mean street; and they should be taught that *vennel* or *vennal* is not peculiar to Scotland—there have been Vennels in Newcastle and Richmond in Yorkshire, in Lancashire and in Cumberland also.

Children, and even grown-ups, have such mistaken ideas of the commonest names of their own streets and places! Street-names with the word 'gate' as part of the name are often wrongly supposed to denote a gateway or entrance—the Cowgate and Canongate of Edinburgh, the old Sandgate of Ayr, the Shoregate of Berwick, the Trongate of Glasgow, the Overgate and Nethergate of Dundee, the Castlegate of every town that had a fort or castle, and the Gallowgate of every town that possessed a Gallows Hill. But even children are delighted to know that in every case in Scotland this is simply the old Scots 'gait,' meaning a road or way—as Burns used it in the opening lines of 'Tam o' Shanter;' and once this is clear our street-names acquire a new significance, and they take us then into the early historical conditions of our towns. The Tron-gate becomes the 'gait' or road to the public Tron or weigh-house, the Sandgate is the 'gait' or road to the sands or beach, and the Cowgate is simply the road along which our forefathers drove their cattle to the common pasture beyond the burgh. *Gate* in this sense is quite common also in the north of England; Kirkgate in Leeds, Bradford, and Huddersfield means the same as in Irvine; and Leeds has a Briggate too.

One sees now how by such teaching ordinary class-work even may be much enlightened. We should all like to see the geography class taken out occasionally to 'perambulate the marches'—that is, to go accurately over the boundaries of their own town or parish. Usually these boundaries are quite unknown to the residents within them. About eight miles from Aberdeen, and reached by frequent, cheap suburban trains, we have what is probably the most northerly Roman camp in Great Britain, described by

General Roy over a century ago, and still in excellent preservation. It occupies a site precisely similar to that of Borcovicus on the Roman Wall. What an excellent thing it would be if every class of children in the neighbourhood engaged in the study of Roman or early British history were to see this existing evidence of the presence here of that marvellous people! It would give a touch of reality to the lesson that nothing else could do, and would develop in the pupils a real interest in the story of Rome's futile attempt to bring the northern part of our island-home under her sway.

The main purpose of introducing the teaching of local history, however, is not merely to give information and to brighten educational work; it is to give children a larger and fuller interest in life. The ordinary things about us in town and country, seemingly so commonplace, will become transformed for those who have the seeing eye and the understanding heart. We remember how G. F. Watts inspired his village in the undertaking of building a mortuary chapel. Through this systematic and adequate training of our children in the story of their own locality such inspiration may be found in every parish in Scotland. At present, in respect of an intelligent historical interest of this kind, the condition of things in both rural and town communities is far from what it should be. A short time ago I visited the chain of old castles in the valley of the Don, every one of them enshrined in the most interesting literary and historical associations, and certain of them associated with the greatest events in our national history. But, with one or two exceptions, these old historic structures are in the most ignoble and neglected state, used by farmers as cart-sheds, or poultry-runs, or stores for old bottles and kitchen utensils, and going rapidly to decay. You find the same thing in other parts of the country, even on the property of royalty itself. Yet these structures have a high educational value, and one feels that if the young people of a parish—the Mutual Instruction Society, say—would make it their business to find out and make known the story of the historic monuments of their parish, and take steps to put these into proper order and to preserve them, they would find inspiring occupation for their own spare time, and be doing really important work for the country.

Then this other point may be noted, and it is important. The Education Department is thoroughly sympathetic. This is indicated in both the special memorandum on the teaching of history in Scottish schools, issued in 1907, and in the present code, under which outdoor instruction, such as nature-study or a class visit to an historical building (and presumably any historical remains or site), will be recognised as an attendance at school. It lies with our Scottish School Boards to make this a matter of effective living force in the education of our

children, and so give to the coming generation of citizens a more cultured mind and imagination, and a more wholesome and intelligent and helpful interest in the surroundings of their daily life.

One thing more ought to be said. In order that this work may be accomplished a small hand-book or manual of the history of each locality will be necessary; but that will soon be forthcoming if only some indications could be seen that our educational authorities are willing to encourage this teaching in our schools. The cities will be easily provided for. With regard to the country districts, we have in every parish in Scotland at least one minister and a teacher, either of whom should find a pleasure in preparing an historical manual of the parish. They would have the *Statistical Account of Scotland* (*Old and New*) to work upon as a basis in every case, and many suggestive works that would be helpful (ecclesiastical, historical, personal, and those dealing with place-names) have been published since the *Statistical Account* appeared. And then we have had already three volumes for Scotland by the Historical Monuments Commission (Berwickshire, Caithness, and Sutherlandshire), and these publications will ultimately place on definite record the chief historical remains in every county in Scotland. The essential

thing is that these local historical manuals must be prepared by persons in the district with full local knowledge and interest, able to give the requisite intimate local stimulus and colour. I know of one case, in a remote Aberdeenshire parish, in which a daughter of the manse, having completed her educational course at Edinburgh, is now engaged on a history of the parish, and it is work which an educated lady, with the dainty feminine touch and imagination, and the capacity for taking pains, may perform better perhaps than the ordinary man. At all events, it is most useful work waiting to be done, likely to be fruitful in lasting results for our people individually and for the country. England is even better provided for than Scotland in regard to material. The Cambridge University Press, having covered a large part of England by the issue of their various county geographies, have also entered Scotland for this purpose. There are and have been efforts made by other publishers to supply county geographies; in one case a whole series has gone out of print presumably because there did not seem to be sufficient demand for the firm's little county geographies. But if the new spirit can be infused from the educational side to begin with, the historical and literary material will soon be found.

THE HOUSE BY THE MOOR.

PART II.

AFTER a while she let me feel her pulse, which was galloping at a great rate, and she let me see her tongue, which was parched and dry. Her hand was burning with fever; her whole body was in a glow. After some difficulty I was allowed to look at the wound. It was here that the fire burned most fiercely. A great crimson flush of inflammation encircled the wound. It was the blush of erysipelas. As I saw it my heart sank with anxiety for the patient, for there could not possibly be a worse outlook for the turn of events.

This accounted for the high fever and for the delirium! Was the shadow of death near at hand? I was left to my own resources by Mackenzie as usual. What could be done to relieve my patient? Dr Farquharson was ill in bed with bronchitis; his assistant was a son with no more experience than myself. So from all sides I was cut off from help. The last train from Edinburgh was the one that brought me to Blakieston. I made up my mind, therefore, to act for myself.

Mackenzie hardly ever gave me any directions for the medical management of his cases, and to my inquiries for advice he usually replied, 'Oh, for goodness' sake, Edward, do think of something that will fit, and don't be stupid!' The result was that I was eternally racking my brains

for something that would fit, and so learned my *materia medica* nearly by heart. Besides, the word 'stupid' was an excellent stimulus to the pursuit of knowledge.

In my present emergency I wanted something that would subdue my patient's fever and check the spread of the erysipelas. Alas! those were not the days of antiseptic surgery; plain water dressings were the order of the day. Lord Lister was then a young and promising surgeon, but the germ theory of disease was so obscure that antiseptic surgery was as yet not even a dream. After some thought I used remedies I deemed advisable under the circumstances, and retired to my room for the night.

There was a pleasant wood fire burning in my bedroom upstairs, and I was glad enough to feel its kindly warmth. Besides, it would give a light in the room in case of my being called up during the night. I was tired with the day's work; and the pillow-case, that had lain in lavender, gave my bed a fresh, country fragrance that suggested sleep, and perhaps dreams of my home in the south.

I lay down to rest, but sleep did not come quickly to my bidding. I tossed about and thought of the day's events, half in wonder and half in anxiety as to what the morrow might bring forth.

I knew that matters had taken a serious turn in the sickroom. I had been accustomed to the 'wild and whirling words' that patients utter in their delirium; but I could not help thinking that there was some hidden meaning in the words, 'They have taken my heart away.' Was there a loved one in the background? Was the mystery of the operation due to his influence or to his probable appearance? A tumour had been removed from my patient's body; it was thought to be malignant in character. Was this sufficient reason for withholding the patient's name from one who had acted as the surgeon's assistant, or for keeping the servants in the dark as to the performance of any operation whatever?

I lay and thought, and presently the sleep so long wished for came and 'slid into my soul.' With the sleep came a dream. I dreamed that I was wandering on the sands at Cramond, a favourite sketching-ground of mine. It was low-tide, and there was a great space of shore in front of me, with the tender colour of burnt clay; violet shadows moved slowly here and there, and there were great streaks of dark green and purple where the seaweed lay in clusters on the low-lying rocks. Sunset was near, and there was a glow of fading daffodils in the sky above, and a wash of cool gray in the clouds that touched the tiny thin line of sea below.

The sea-fowl had gone to rest. The sky was empty of life. I could see no figure on the sands. I was alone on this desolate shore.

No. What is that dark speck moving by the little wood that overhangs the cliff near Queensferry? It becomes suddenly larger; it is the figure of a man. He is coming my way: a young man of about six-and-twenty, with firmly knit limbs, light hair and beard, a downcast face, and eyes that are in shadow. He passes near me, and I hear him mutter, 'They have taken her heart away;' and then, with a sigh, he adds 'Poor Jessie!' I would have touched the young man's arm, I would have spoken to him, but he passed swiftly by. I thought I heard him moan as he went along the shore.

Then the scene changed quickly. I was in the dull, dark street of the Canongate; it was winter; the snow was melting. I picked my way carefully between the slushy pools that lay before me in the ill-paved way. Somebody touched me on the arm. I looked round, but there was no one near. I walked on a few steps; the lamps gave an uncertain light there, and my arm was touched again. Yes, this time a poor, wan-looking, dark-eyed girl was standing by my side; she laid a thin white hand on her breast. 'I am dying,' she murmured. 'They've ta'en my heart awa'. I awoke.

Why, who is that standing by my bedside?

'Oh doctor, we are very sorry to disturb you,

but Jessie is so ill! Would you mind coming down to see her?'

It was the patient's mother who spoke. She was standing near me, looking anxious and worn, and when she was telling me that Jessie was so ill there was a little break in her voice that showed how sorely her heart was tried.

I was so confused and, for the moment, startled that all I could do was to rub my eyes; and I am ashamed to record the fact, but I yawned. However, in another moment I had recovered myself. 'By all means; I will be down in a minute.' And then a sudden fear seized me. Was the dream a warning of impending death? And the burden of my responsibility seemed greater than I could bear. However, I tried to steady my nerves; the very act of dressing diverted my thoughts for a while.

The sister was waiting for me on the landing below with a light in her hand. I heard the patient's voice from within, and when the bedroom door was opened there was a loud and sudden cry, 'Jeannie, Jeannie, I canna bear it any longer. Send for Roderick—at once, I say—at once, Jeannie. I must see him before I die.' And then in a lower tone she added, 'For I am dying now.'

Then, as she saw me coming towards her, she became calmer, and put out her hand for me to take, and murmured, 'You've brought it back to me, doctor! I know by your face you've brought it!'

A sudden thought flashed across my mind. Why should I not fall in with her humour? 'Yes, I found it on the sands at Cramond,' I replied, and the figure of my dream seemed to whisper to me, 'Give it her back, doctor.'

'Jeannie, he has been to Cramond for me, seeking my heart! Is no' that bonny o' the young doctor?' and the poor girl gave me such a grateful look. But, oh, how fevered was her touch, and her pupils, how widely dilated! There was mischief in the brain.

'You see now, if you only put your hand on your side you'll feel it beating there all right;' and I took her hand in mine and laid it on her left side for a moment.

Her face brightened as soon as she felt the rapid pulsations of her heart. 'Oh, but that's bonny o' ye, doctor—that's bonny. Ye said ye'd try.' And she held my hand for nearly a minute to make assurance doubly sure; and then quietly releasing it, she looked at me steadily. 'You found it in your dreams, doctor, on Cramond sands, and Roderick M'Alister passed you by.'

I was so amazed at this allusion to my dream that I simply bowed my head in acquiescence. Was this a case of second sight? Had Roderick M'Alister really crossed the sands and spoken those few words of sorrow, or was I dreaming still?

While I was watching my patient I heard the deep clang of a bell downstairs, but it seemed to have been rung miles away, and the sound had been carried to me in this chamber of sickness by the wind. The poor girl had heard it. Her senses were abnormally acute. She turned round to me quickly, with 'Hark, that is Roderick!' and held up her right hand as if to command silence. But for a moment the silence was only broken by the crackling and hissing of the last log that had been put on the fire. Then she said again with a tremendous earnestness, 'That is Roderick! His foot is on the stair; he is coming to see me once before I die.'

The effort of speech seemed to exhaust her, for she lay for a while breathing very slowly, with her eyes shut and her hands outside the bedclothes, in the position of one who has fallen asleep in a trance, or like a marble effigy of sleep. Then her face changed; the mouth twitched uneasily as though a spasm of pain passed through her body; the fever flush died out of her cheek.

'Roderick, thank God!' was whispered by her lips, but the sound was so faint that only her sister and myself could catch the words and guess their meaning.

Suddenly the bedroom door opened, and Roderick M'Alister of my dream strode quickly across the room to the bedside of the dying girl, for now Death had indeed set his seal on her; she was sinking fast, and no power on earth could save her.

'Jessie darling!' and the young man bent over the form of his loved one; but in a moment he pushed the bed-curtains aside with a quick, impetuous movement. 'More light, Jeannie—more light. Oh God, she is dying! Doctor,

can you do nothing for her? Save her, doctor, I beseech you, if you can. Can nothing be done? Look at her, doctor; she has changed.—Speak to me, Jessie, one word; but one word, my heart's darling!' and the poor, thin lips of the sufferer moved a little, the eyelids trembled, then there was a deep sigh; but no word came from the lips; the sigh was voiceless; then the light died slowly out of her eyes. 'Jessie' had passed away.

What could I do now in the chamber of death? Grief is a sacred thing. I had no longer a place by the bedside. I touched M'Alister on the shoulder. 'It is all over,' I said; and, dazed, stunned, with a great grief at my own heart, I left the mourners with their calm, impassive, silent dead. But before I had reached the bedroom door I heard M'Alister sobbing and moaning and grieving like a broken-hearted girl.

And then a thought came swiftly to me. It seemed almost an act of injustice, the taking this sweet life away. 'Oh God, why didst not Thou save her?' But there was no reply to my unspoken thought.

The wind was rising, the casement shook, and as I went upstairs to my bedroom I looked out from the landing window. Great masses of fleecy clouds were hurrying by; and, as in a vision, I saw 'Jessie's' figure lying peacefully in the hollow of a great, billowy cloud. She was asleep, and her right hand lay upon her breast.

The fleecy vapour moved rapidly along, driven by the wind; then a great shadow fell upon cloudland, blotting out all light and colour. I could see no more.

THE END.

ALBANIA AND THE ALBANIANS.

By WILLIAM WILSON.

STRANGE it is that even to-day there are portions of Albania as little known to Europe as similar regions in Afghanistan. The mountainous nature of the country has not been the real hindrance, but the fighting, not to say murderous customs, of its people have defied the explorer; and these customs have at least the sanction of high antiquity, for the most ancient records of Greece and Macedonia bear only the interpretation that Albania of that day was as Albania is now, a land of fierce and fighting tribes.

The Albanians are allowed to be the most ancient race in south-east Europe, descendants of the earliest Aryan immigrants. While all the rest of Europe has changed ethnologically and socially, Albania has stood still. While almost every other part of Europe has been overrun time and again with stranger tribes

and alien peoples, Albania has kept her race almost pure. The various intrusive races that have surged round her borders, Celt, Slav, Goth, and Turk, have been repelled or assimilated.

The Austrian Von Hahn, one of the few scholars who have studied the Albanians near at hand, asserted long ago that they were undoubtedly a branch of pure Pelasgian stock. For some time, however, the whole Pelasgian race was considered as doubtful, and some authorities even went the length of denying its existence, at least as a race. To-day 'the whirligig of time has brought its revenges,' and recent scholarship has gone far to show the wonderful part played by this ancient, silent, and obscure people. Yet it is to be noted that, however pure the Albanian descent may be from these Pelasgians, their mode of life, their manners and customs, and their occupations.

have been widely different. The one is, and has always been, a race of warrior clans; the other was a race of urban cultivators, people who lived in towns—walled towns—and cultivated the land. How, then, can the one be derived from the other? To this curious problem the researches of M. Edmond Demolins and M. Gabriel d'Azambuja have furnished an unexpected solution, valuable in more than the historical sense, in that it supplies a clue to the strength and weakness of the Albanian peoples, and more than a hint as to their future possibilities.

From Cyprus to Marseilles every shore and island of the north Mediterranean bears at least some evidence of the Cyclopean masonry associated with the Pelasgian peoples. Northward through the *Ægean* and along the southern shore of the Black Sea their remains are found in varying profusion; and M. Demolins has noted that almost always these primitive remains are found near the centre of the valleys, generally on some hill or mound rising above the level of the marshes, withdrawn equally from the sea and from the mountains. Obviously their builders were a people whose industries and interests were confined to the low valleys. The picture our imagination unfolds is that of an agricultural people, who tilled the ground and planted fruit-trees, who dwelt in towns for mutual protection, whose organisation enabled them to undertake huge works of drainage and amelioration of the soil, and even more extraordinary works for the defence of their towns; on the other hand, a people with a social organisation unequal to the art of war, unable and disinclined to extend their sway over seas or mountains, to form a kingdom, or sustain an empire. From the extent of their remains in the islands and the valleys adjoining the *Ægean*, it is inferred they were the first civilised incomers to that region. Before the Phœnicians from the sea built their ports, before the first hint of invasion from the mountains, the Pelasgians had sought out, and were at home in, every valley of this ancient world, spreading from valley to valley from some centre that can be dimly guessed at. A Saturnian land, of peace, of happy industry, untroubled by the world; a land of the earliest, one might almost say of the home-made, gods. The picture is not without its charm to-day.

Yet not even the most peaceful of cities can remain for ever peaceful, and our Pelasgians cannot escape the common fate. From the punishment due to the sin against iron custom or the crime against the law the offender would endeavour to escape, for which purpose there were two possible ways—the sea and the mountains; and while ships were rare and uncertain, the mountains were always ready, friendly yet severe. No Pelasgian who had the resources of the valley and the support of his city would voluntarily make the change; only dire necessity could force

him; and both the cause and the effort would put their stamp on that man. In the valley every man's hand would be against him; in the mountains food would be scarce and hard to get; there he would have to struggle against Nature, against those who had arrived before him, and against those who followed, and sustain the struggle alone. The outlaws and fugitives from the quiet, plodding routine of the Pelasgian city had to strengthen and harden themselves into warriors and brigands; warriors because their scanty culture and their herds and flocks needed constant and armed protection, and brigands because brigandage was the lawful and honourable means of supplementing a scanty livelihood. Such has been the origin of most of the mountain tribes of the ancient world.

In such a way and in course of time the mountains became peopled. Coming singly or in very small groups as they did, thrown on their own resources, the new environment had its full influence on them. The communal thoughtlessness and routine, at once the support and the bane of all Eastern peoples, had to be cast off like a garment, and individualism came into being. At a little later period just such a set of factors, under somewhat different conditions, gave birth to ancient Rome, and through Rome gave the first great example of what individualism is capable of.

But though the same process went on in other regions, only in the huge extent of the Balkans did these new social conditions reach a high development. Elsewhere the people of the valleys and lowlands were, as a rule, numerous, and strong enough to hold their own with the mountaineers; in Albania the case was reversed, and time and again the mountaineers in mass, and at all times individually, won their way back to the plains and the towns, and, their stronger social fibre and sharpened individuality aiding, became the police, the leaders, and frequently the governors and rulers of their one time fellow town-dwellers. The descents of the Heraclidæ, of the Hellenes, and of the Dorians are but the traditions of some among many such return movements in mass from the mountains to the plains.

It is characteristic that at no time have these mountaineers founded an empire in the mountains; their successes have all been elsewhere. At home almost every household is divided against itself, each householder against every other householder, each village and clan against the other villages and clans, each tribe against every other; and the two great divisions of tribes, *Gheg* and *Tosk*, are at bitter enmity even to-day. The elements that go to form a stable political unit are not all to be found here. At times, under outside pressure, clan will unite with clan and tribe with tribe, and choose or submit to a leader against a common foe; but these alliances

are contrary to the ingrained habits of the people, they are sustained with difficulty, and dissolve readily. Then once again the old quarrels about flocks and grazing-grounds break out, old blood-feuds are revived, and the country is soon back to its former state. It has been estimated that in parts of Albania 75 per cent. of the population die a violent death; and yet the women go unharmed. Can the hill tribes of Afghanistan match such a record?

Rooted in their mountains, the Albanians have held their own for three thousand years, possibly for longer. At the time of their greatest expansion they must have reached well-nigh to the Danube; and that they crossed the Gulf of Corinth is well known. The Macedonian Phalanx was formed and recruited by Albanians; and though some writers have fancied that Alexander's armies were recruited from Celtic tribes on the upper reaches of the Danube, that is only probable in a secondary degree, as the Albanians by race, by tongue, and by civilisation were closely related to Macedonia and Thessaly, while the Celts had not one of those ties. The Albanians were, in short, really 'Hellenes,' the Celts 'barbarians,' and, most important of all, at no time in their history have their military qualifications been in doubt. Under a leader such as Alexander they had the world at their feet. With Greek and Byzantine they have thriven; against Slav and Turk they have suffered. Yet, though the margin of their land has changed hands often, the core of it has ever been unconquered. Only that masterful race the Romans seem to have held part of it for a time; they kept a road open from Durazzo to Salonica; though what effect their presence had on the people is not known. At a later time invasion came from the north; Slav peoples, driven south across the Danube, pressed the Albanians, and with success, as the boundaries of Old Serbia and the prevalence of Slav place-names in regions now once again Albanian testify. Under the Turk, however, and against a disunited Serbia, the equally disunited Albanians made progress, and that by methods too common, unhappily, to all the peoples of the Balkans: by murder, outrage, and extermination.

The decay of Turkey has been marked by the rise of the Balkan states, who have asserted themselves as independent nationalities. Freed from the Turkish incubus, they have made rapid strides in political no less than in military organisation. The Albanians have made no such progress. The triumph of the allies brings Albania to a new phase in her career, and one for which she is wholly unprepared. The influence of Austria-Hungary and Italy will no doubt result in Albania being set up as an independent state. Her boundaries will be sharply defined, and her neighbours, as soon as they have organised their new territory, will put a force on the border-line, ready and sufficient to deal with

any marauding expedition of the Albanians; and so their supplementary occupation of loot and blackmail will be gone, throwing them back on the resources of their own mountains, and these have never been sufficient.

It is indeed a question whether it would not be wisest to divide Albania up among the neighbouring countries, leaving each to assimilate its portion as best it could. Such a plan would at least give the Albanians a wide field for their energies, which a limited independent state does not. But such a method will not commend itself to the powers that be. Albania will become an independent kingdom, and whoever becomes the ruler of such a wasp's nest will have his work cut out for him. To draw the jarring elements of such a society together and turn their activities from private war to industry, or anything approaching industry, will be a difficult, many would say a superhuman, task. Yet the race has great natural qualities which the country develops, while denying a field for their display. At home their spirit of independence, their gloomy pride, and their hard life form a strong character. All over the Near East they are noted for qualities somewhat rare there: simplicity, honesty, faithfulness. If proof of their constancy and fortitude were needed, the story of the Suliot clan would suffice. De Quincey tells us how, when the Suliotes were, in a final effort by the twice beaten army of Ali Pasha (another Albanian, be it noted), surrounded, starved, and finally tricked into surrender, and found that that monster had no intention of keeping his word, but was bent on their complete extermination, 'when all hope and all retreat were clearly cut off, then the women led the great scene of self-immolation, by throwing their children headlong from the summit of precipices, which done, they and their husbands, their fathers and their sons, hand-in-hand, ran up to the brink of the declivity, and followed those whom they had sent before. In other situations, where there was a possibility of fighting with effect, they made a long and bloody resistance, until the Turkish cavalry, finding an opening for their operations, made all further union impossible, upon which they all plunged into the nearest river, without distinction of age or sex, and were swallowed up by the merciful waters.' Such a record shows these people to have a temper of their own.

When the Albanian leaves his mountains he enters a very different world, but thrives, sometimes in an astonishing way, of which the career of Mohammed Ali is a striking example. Entering on his career as a soldier of the Sultan, he was sent to Egypt, where he became ruler, conquered half of Arabia and Syria, even seems to have had designs on the sultanate itself, and founded the present dynasty. Compare this career with that of Ali Pasha, and it will be seen that the Albanian does not lack ambition.

Under the best of conditions, however, they, like all clan peoples, are assimilated and lost when settling singly in a strange country; but that there is a better prospect for them when they leave home in groups of both men and women—when they carry their homes with them, so to speak—is shown conclusively by the story of the Hydriotes, told as follows by M. Demolins: 'In 1730 some Albanian colonists, sick of the exactions of the Turkish Pasha in the Morea, where they had settled, took refuge in the isle of Hydra, and were there left in peace on payment of a small tax. Soon their commerce, diversified with a little piracy at times, increased rapidly. Hydra occupies, it is true, a very happy position, commanding the entrances of the two gulfs of *Ægina* and *Nauplia*; but it has no port, not even a shelter worthy of the name. It is, then, in spite of nature that the Hydriotes made of their rock a rendezvous of commerce, their ships having to press into some crevices of the coast, where they were secured, one against the other, by heavy cables. Profiting by the war between England and France, the Hydriotes entered on the commerce of the Levant and the Black Sea, and soon extended their traffic to England and the Baltic. At the moment of the Greek insurrection of 1821 Hydra was the richest isle of the Archipelago, and its population was estimated at forty thousand inhabitants. The shipowners of Hydra possessed nearly four hundred vessels, of from one hundred to two hundred tons, and during the struggle with the Turks fitted out against them more than one

hundred ships armed with two thousand guns. Hydra furnished to the insurrectional fleet its most intrepid chiefs, Jacob Tombazis, Tsamados, and Andrew Miaoulis, who with the Ipsariot Canaris attacked with their fireships the fleet of Ibrahim in the anchorage of Modon and even in the port of Alexandria. One can estimate the capabilities of these mountaineers, who could thus, and in so short a time, transform a bare rock in the middle of the sea.'

The conclusion seems to be that the Albanians will need firm government at home, and a field for their surplus population abroad. Enlisted by Turkey they will only serve as an instrument for the oppression of its remaining subject races—a wretched fate for both, and one of which the world grows weary. Is there nothing better? The Albanians are the Swiss of the Near East; once their history is understood it must make the strongest appeal to the freedom-loving British people. The British Empire at present is only the outline, the sketch of an empire. From New Zealand, from Australia, from Canada, comes the cry for more people, ever more people. These great countries—we never realise how big they are—could take in and hide away *ten* Albanians complete. The Albanians are not really an alien people; they are in many ways like our own; they are people we could amalgamate with, and in the British Empire they would have a future assured. Dealt with with the care and consideration that our Dominions now give to likely colonists, a judicious scheme of emigration might well become a striking success.

POETRY AND PERFUME.

By the Right Honourable ROBERT FARQUHARSON, P.C., M.D.

I ALWAYS pity those truncated mortals whom grudging Nature has deprived of the sense of smell. Wordsworth was one of these, and in the course of his laborious and not invariably successful efforts to prove himself a poet, he was constitutionally prevented from recording the delicious satisfaction of a good country sniff of cunningly blended air. Dean Stanley also was unhappily unable to add this faculty to the complex charm of his attractive nature, as the following anecdote will show. On one occasion he was entertaining the famous Master of Balliol to a 'five o'clock,' when, after the sixth or seventh cup, he looked into the pot and suddenly exclaimed, 'Good heavens, Jowett! I've forgotten to put in the tea.' It must, I should think, have taken more than the philosophy of Plato to carry off such a ludicrously tragic incident. It might have been kind of the eminent Grecian, on the principle that it is always friendly and politic to announce the fact that a bottle of champagne is corked, to point out to his host that as a

tune is 'a great outset to a song,' a teaspoonful or two of bohea is a real addition to the hot water by which it is infused to supply the non-inebriating cup.

Sometimes, when strolling along roads or heaths or through fields or forests in the 'leafy month of June,' or later, I have tried to note down the variegated perfumes that assail the olfactory nerve. First and foremost I must put the deliciously aromatic scent of a pinewood, which successfully evades description, but which is run hard by the birch and the lime, and the heather, with its suggestion of grouse and honey floated from or imprisoned within the hexagonal cells which contained the delicately tinted product of the bees' industry. New-mown hay is grateful to all but the victims of that mysterious and annoying form of asthma which it causes; freshly turned-over earth used to be inhaled hopefully by consumptives; and sometimes there is a subtly compounded blend which we cannot analyse, but only enjoy, and which is redolent of the full essence of the open air and

fresh fields and pastures new, and whiffs of associations with past times and half-forgotten memories.

But we are now nearing the garden, and if we have wisely arranged its contents according to Sir Francis—I was lately admonished by a well-informed correspondent for calling him Lord—Bacon, we shall be almost staggered by the full blast of aromatic odours that tend to soothe our savage breasts. Your space does not allow me to quote in full from the Lord Chancellor, and I must refer my readers to his essay 'On Gardens' for the full text. But let me take out a tit-bit or two:

'And because the breath of flowers is far sweeter in the air (where it comes and goes like the warbling of music) than in the hand, therefore nothing is more fit for that delight than to know what are the flowers and plants that do best perfume the air. Roses, damask and red, are fast flowers of their smells, so that you may walk by a whole row of them and find nothing of their sweetness—yea, though it be in a morning dew. Musks likewise yield no smell as they grow, rosemary little, nor sweet marjoram. That which above all others yields the sweetest smell in the air is the violet, especially the white double violet, which comes twice a year, about the middle of April and about Martinmas-tide.' He also enumerates the musk-rose and 'the strawberry-leaves dying with a most excellent cordial smell'; also vines, wallflower, sweet-briar, pinks, and gillyflowers, and honeysuckle-leaves. Truly a pretty comprehensive catalogue! And following his safe advice, it were well to 'set whole alleys of them to have the pleasure when you walk or tread.' But let me not forget the heliotrope, which perfumes the air with the odour of cherry-pie, and the tobacco plant, white and mauve, whose 'delicate air' translates somewhat strangely into 'the Stygian fumes of the pit that is bottomless.'

I think we shall all agree with Oliver Wendell Holmes that 'memory, imagination, old sentiments, and associations are more readily reached through the sense of smell than by almost any other channel.' He specially mentions phosphorus as bringing recollections of early chemical experiments. 'The marigold and everlasting, the fragrant immortelle of our autumn fields, has the most suggestive odour to me of all those that set me dreaming. I can hardly describe the strange thoughts and emotions that come to me as I inhale the aroma of its pale, dry, rustling leaves.' And so on, through more charming and suggestive paragraphs that are to be met with in that delightful symposium of wit and wisdom, *The Autocrat of the Breakfast-Table*.

But our own experience can add to the list of calls of memory opened up in our brain by some perchance forgotten smell. One drop at most of Bailey's ess bouquet will not 'make a

cat aghast,' but will recall to me the old Edinburgh Assembly Rooms, with the best floor in the world, peopled by the best waltzers in the United Kingdom, dancing the charming *trois temps* of alas! bygone days, to the stirring strains of Wallace's band. Southernwood, sometimes called 'apple-ringie' and at others 'old man,' more especially when taking its place in a posy with heliotrope and the almost-forgotten moserose, vividly recalls our old family pew in Birse Church, when the air was laden with snuff and peppermint, and the 'passon' droned like a cockchafer over our heads, until the clatter of pennies in the collecting-boxes told us that relief was at hand. Does not peat-reek or burning wood take us into the interior of the humble cottage where the porridge or red herring further perfumes the air, and the 'big ha' Bible' announces the final act of *The Cotter's Saturday Night*?

But I could run on thus for ever, and must now come to Oliver Wendell Holmes's anatomical explanation: 'There may be a physical reason for the strange connection between the sense of smell and the mind. The olfactory nerve—so my friend the professor tells me—is the only one directly connected with the hemispheres of the brain, the parts in which, as we have every reason to believe, the intellectual processes are performed. To speak more truly, the olfactory "nerve" is not a nerve at all, he says, but a part of the brain in intimate connection with its anterior lobes.'

We can quite understand the suggestion, 'No flowers, by request,' at funerals, for stephanotis and other heavily scented components of the regulation wreaths would infallibly recall the sad occasion when the bread-earner and the heart-winner has been consigned to the 'cold, cold ground.' And to any one beginning life I would strongly recommend planting little dépôts of odoriferous association along the sands of time. 'Of what is the old man thinking as he sits in his old arm-chair?' There is, perhaps, a flower or two before him, or he takes up a handkerchief impregnated with some perfume, and his memory goes back gratefully, if mournfully, to some unforgotten comrade who has fallen by the way, or to some tried friend who still remains to turn on him a loving eye, or to give him a cordial handshake, and the happiness of his life will thereby be much increased. Idiosyncrasy plays its usual mysterious part here.

'What is one man's food is another man's poison,' and scents which are delightful to some are loathed by others. Tuberose makes a special type of human being sick and faint, horses are thrown into almost uncontrollable agitation by the smell of blood or of deer in a forest, cats love valerian, lavender-water will reduce the carnivorous appetite of the fiercest inhabitant of the Zoo, all the ruminants love tobacco, and

where the carcass is, there are the eagles gathered together. The most delicately nurtured lapdog will not only relish the most disgusting carrion, but for more intimate appreciation will roll over and over in it.

Sir William Gull made great use of his nose in medical practice, and we all know how such vapours as chloroform and ether do their work far more quickly and effectually than when these things are administered by the mouth.

During the last year or two I have been employing myself more intermittently than industriously in picking out references to smell in poetical literature. Lack of time and want of opportunity have prevented me from making a long list, but I highly commend it to some of your leisured readers as an exercise both of interest and utility. It will bring them into lively contact with our greatest minds; and even if the search is not altogether successful, let us remember that 'the advantage lies in the endeavour, not the prize.' Here is what I have been able to dig out. Let me begin with the national poet so dear to the heart of every true Scot:

Till some evening, sober, calm,
Dropping dew and breathing balm . . .
Ye woodbines hanging bonnie

In scented bowers . . .
At even, when leaves their fragrance shed,
I' the rustling gale;
And birks extend their fragrant arms
To screen the dear embrace.

'In passing through a park with my father,
the poet suddenly fell on his knees and said,
'Violets, man; violets. Smell them, and you'll
sleep better.'—FIELD.

His queen, the garden queen, his Rose,
Unbent by winds, unchill'd by snows,
Far from the winters of the West,
By every breeze and season blest,
Returns the sweets by nature given
In softest incense back to heaven;
And grateful yields that smiling sky
Her fairest hue and fragrant sigh.—BYRON.

All the year round we there should stray
Through fragrance of the new-mown hay,
And sit and ponder old-world rhymes,
Under the leaves of scented limes.

TENNYSON, *The Garden that I Love*.

Where the light wings of Zephyr, oppress'd with
perfume,
Wax faint o'er the gardens of Gül, in her bloom.
BYRON, *Bride of Abydos*.

'The evening primroses were lighting up the
garden with their yellow cressets, and smelling,
thus bedewed, just like new-made butter.'

Imbower'd vaults of pillar'd palm,
Imprisoning sweets, which, as they clomb
Heavenward, were stay'd beneath the dome
Of hollow boughs. . . . On either side
All round about the fragrant marge
From fluted vase, and brazen urn
In order, eastern flowers large,

Some dropping low their crimson bells
Half-closed, and others studded wide
With disks and tiars, fed the time
With odour in the golden prime
Of good Haroun Alraschid.

Thick rosaries of scented thorn.
TENNYSON, *Recollections of the Arabian Nights*.

When merry milkmaids clink the latch,
And rarely smells the new-mown hay.
TENNYSON, *The Owl*.

Shakespeare is a mine of wealth on this as on
all other subjects, and I leave it to others to
follow up this rich vein.

Taste is, of course, intimately allied with
smell, and it would be interesting to work them
together. But that is another story, as Rudyard
Kipling would say, and perhaps I may be allowed
to tell it some other time.

THE RUINED TOWERS OF THE BORDERLAND.

THEY stand amid God's plenitude of life,
These hoary walls bereft of human love.
O'er them no more the din of Border strife
Breaks from the ruined battlements above.
Where once the storms of passion rent the air
The river sings in tender blessing there.

Thou rugged guardians of the Borderland!
When ruin grips thy dark, dismantled towers,
What charm can stay the swift, relentless hand
That slowly counts in tears thy passing hours?
Hast thou no voice to sound a last proud call
From out the shadows that around thee fall?

The Scottish spears beside Tweed's silv'ry stream
In bright array shall gather nevermore;
In vain we seek the far-off warning gleam
That called the clansmen to thy inland shore.
The wild whaups weep in sorrow on the hill,
By lonely graves where Border hearts are still.

Close to thy walls the ploughmen turn the lea
On which their sires in other days have trod;
Nor dream, when winds sweep westward from the
sea,
Of kindred resting 'neath the clover sod.
They hear no voice within the driving rain,
These roofless halls unreverenced remain.

Thy precious stones, of Border life a part,
Fall one by one upon the blood-bought ground;
And as these bulwarks sever from thy heart—
A throb of sorrow mingles with the sound.
And, list! from this sweet river passing nigh,
A solemn requiem seeks the evening sky.

GILBERT RAE.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

AT CHERRY-TREE FARM.

By C. EDWARDES.

IN THREE CHAPTERS.—CHAPTER I.

ARNOLD walked all that night and the following day without anything like a rest. He saw things without heeding them. The fading of the stars, the creep of the dawn, and then the sun starting up to the left of him were matters of course. So were the market-carts plodding on to Covent Garden, leaving trails of tobacco-smoke behind them. He got past these quite easily. Only the motor-cars gave him a glimmering consciousness of himself—their brutal bright eyes and offensive sudden bark when almost on the top of him; he rapped out a curse at one of them as it flashed past at about 'thirty,' just scraping his toes. This was in a lane little wider than the car itself. The lane smelt of honeysuckle, and he was aware of that. A ripple of laughter drifted back to him from the car, and then he was more lost than before—indignant still, but totally lost.

And yet he brooded all the while. He mixed up Gertie with Mr John and Mr Ralph—these three were the enemies who had sped him forth like thistledown before a gale. There was a fourth—Hilton Caswell, a fellow with very black eyes, moustache, and beard, and a complexion like a smoked cider-apple's. But after the birds began to chirrup he didn't make much show in Arnold's wilderness of a mind. That was odd, considering how intimately he had to do with Gertie and the present flight from Surbiton. Arnold stopped once by a milestone, and with his hand on it tried to hold on to Caswell's personality. He had always hated Caswell's red-faced smile, especially when Gertie was near it; but why—why—why—and who *was* the brute? It beat him, and, shaking his head at the milestone, he wandered on.

Mr John and Mr Ralph lasted much longer in him. They bullied him about contangoes and Heaven knows what. He could hear their voices. 'Now then, look spy with those accounts. What! Tired, d'you say? Rubbish! You don't know your luck, making an extra dollar every night this week! Not many firms treat their clerks like that in boom-times. Don't grouse about nothing, and hurry up!' That was Mr Ralph. A good-hearted sort, Mr Ralph.

No. 125.—VOL. III.

[All Rights Reserved.]

Mr John's method was a bit keener. 'Good God, not done with your lot yet! When *will* you be? Look here, you'll have to march to the scrap-heap if you don't hustle.' This was in the office, of course, with all the lights on. What a relief to slip away for the last train of the livelong day! Then Gertie got complete control of him. There he sat, collapsed in an empty 'third,' facing the blankness of a future without her. All this sweating and tearing after-hours' work just for himself? Not much. Impossible. Why, she had been the sustaining keystone of his efforts for years. He had said just that to one of the men in the office—what was his name?—'If I wasn't engaged I'd chuck it and buy a revolver. A fellow's head can't keep it up without the best kind of hope. That's what she is to me—the very best. We're to be married when I've saved two-fifty, and I'm in the two-twenties already.' 'Poor old Johnnie! you'll soon be in your chains as well, then,' the man had retorted rather nastily. Every one had raw edges in boom-times. He himself felt like taking the man by the ears (he had conveniently large ears) and putting his nose in the ink-pot. What *was* his name? He could see him as plainly as Gertie herself; but as for his name, that couldn't be caught. Well, it didn't matter. The main thing was to plod on. That was the imperative necessity—to keep moving.

With the warming up of the new day Arnold couldn't think of anything or any one except Gertie. She dodged in and out of him. One time she was a lovely memory, so that he stood and cherished it. But there were other memories which made him shiver and increase the length of his strides. The worst had to do with a letter. It began: 'Dear old boy, you will be distressed to receive this, but I must write it, dear.' It was an awful letter. He couldn't recall any more of it, but it meant that he had lost her. It came to him again and again, always with an accompanying shiver or shudder. Once he was going through a village when it came upon him. Some one put a hand on his shoulder and asked if anything was wrong with him. How he flung the hand off him! 'Mind your

APRIL 19, 1913.

own business!' he cried, and away he went. All he remembered of that village was its inn, with two old-fashioned supporting posts under the window of its porch. But he couldn't have given the inn its name to save his life, although its sign stuck out from that peculiar window. Very patchy this memory of his, even so early in the fateful day!

He didn't want to eat or drink, but merely to move. He didn't exactly want to move either, but there was always that gadfly of unrest urging him forward. As for the roads, he took them anyhow. His gadfly was supremely indifferent. It turned him out of broad white mainways into the narrowest of lanes, and an hour later would land him back into the thoroughfare, with motor-cars and dust all about.

So it went on until the evening, when something—not the gadfly this time—made him get over a rather mouldy gate and zigzag through a clover-scented field towards a stream. The stream took him by surprise. He stood on its bank, stared at some irises in the shallows, and then sat down. It was mowing grass, but it would have been just the same to him had it been ripe wheat. Down he sat, gazed at the, gliding water for a few minutes, and then lay full-length and seemed to sleep.

That was what he required—sleep. The doctor they fetched to him at the white farmhouse above the meadow said so. If he had slept at the proper time, and sufficiently, that is to say.

He was roused by a little image with fat, bare legs, two large, round blue eyes, and the words, 'What *you* doin' here?'

He couldn't answer the question, sat up and looked the child over, and then looked at the stream.

'This b'longs to gran'father, all this part,' said the little boy, with a chubby hand towards the sun. The sun was setting amid crimson splashes behind some distant trees.

'Oh, does it?'

Arnold got up, but had to sit down again. 'I'm done,' he said. A mist came to his eyes. 'What's that?' he asked, pointing at the river.

'It's water,' said the child, with baby conceit. 'Tommy Cat-cart got drowned over there. He fell in.'

'Tommy Catgut!' Arnold exclaimed, and broke into rusty laughter. 'What a name—Tommy Catgut!'

Suddenly the child ran away, and after a time returned with a blue-eyed young woman who was unmistakably his parent. He proclaimed the fact nevertheless. 'Here's mother!' he said.

She was very pretty, and gentle with Arnold; these were the impressions she made upon him. But the questions she asked! And the absur-

dity of his not being able to answer them to her satisfaction!

'No,' he replied rather crossly at length; 'I don't know where I am, nor my name, nor anything. And I don't want to. Let me go to sleep, will you?'

Instead of doing this, she sent Willie to the farm for grandfather. It struck Arnold as droll that the boy should have a name and he none, so far as he knew. He said so with a chuckle that made the pretty young woman gasp and then gaze after her boy.

'I'm afraid you are very poorly,' she said very softly.

He didn't argue the point, only nodded.

'You've been walking all day and all night?'

'Ever so many days and ever so many nights,' he told her.

'Then you *must* be ill,' she said.

And that is what the doctor said he ought to be, if he wasn't.

Willie's grandfather (an amiable giant in brown gaiters) armed him up to the house as irresistibly as a traction-engine, and there he sat shrugging and yawning and able to say nothing convincing until the doctor arrived.

'I'll send him a draught,' said the doctor, after more questions and some mauling. 'And I should think there'll be no risk in accommodating him for the night, Mr Harcourt. He seems a gentlemanly young fellow.'

Outside, on the gravel, the doctor suggested to the farmer the searching of the gentlemanly young fellow's pockets when the potion was doing its work.

But the farmer was a gentlemanly old fellow, and shook his head. 'Time enough for that when there's a need for it, doctor,' said he. 'No doubt he'll be all right in the morning.'

CHAPTER II.

THE farm was called Cherry-Tree Farm, and Arnold stayed there till the harvest. They couldn't coax him to remember the essential things about himself. The doctor confessed that he didn't understand the case. It was the first one of the kind that had come his way. In all other respects save this, the young man seemed sound enough in mind and body. He could, for example, talk about politics very rationally, with opinions about the State in agreeable conformity with those of both the doctor and the farmer. But they couldn't induce him to remember his own line of life, family, place of abode, or—name.

His pockets told nothing. They contained an insurance company's memorandum-book, with no name in it, pipe, tobacco, knife, handkerchief, matches, about nine pounds in money, and a letter. He was persuaded by Willie's

mother to turn the articles out upon the red cloth of the parlour table. The farmer said Peggy might try her hand on him if she liked. She didn't like at all, but regarded it as a duty.

Nothing came of it except some smiles and chuckles from Arnold. 'Anything else I can do for you, Mrs Brandon?' he asked, when she said how sorry she was there was no envelope with an address on it, no visiting-card—in short, nothing helpful.

'We want to assist you to find your home,' she explained.

'Ah!' said he vacantly; and then, looking about him, and lastly at her, 'I seem very well off where I am—that is, if I'm not in the way.'

Willie was in the room at the time, and made up to his left leg. 'I want Mr Man to come out and play, mother,' he said.

Arnold brisked up immediately. He had already played a little with Willie. And in about a minute Mrs Brandon was watching them together at the swing under the farm's oldest cherry-tree.

When he returned to the parlour Mrs Brandon suggested that the letter (still lying on the table) might help them, although it had no cover. But, strange to say, nothing came of this either.

'Won't you read it and tell us if there is anything in it?' she urged, when he seemed unwilling to touch it.

He read it then, tossed it away, said, 'Ah, yes—Gertie! It's from Gertie. That's all over!' and sat with his hands to his head until Mrs Brandon ventured a reminder.

'May I read it?' she asked.

'Certainly,' said he, 'if you think it will interest you.'

It interested her very much; a bloom came to her cheeks while she read it; she glanced at him in the middle of it, only to discover that he was filling his pipe by the window and whistling unconcernedly.

'Don't you remember her other name—besides Gertie?' she whispered afterwards.

He tried, but gave it up. 'I'll be hanged if I do,' he said gaily. 'What a curious thing, isn't it? But—she's about your age, Mrs Brandon. Er—has your husband been dead long?'

'Three years. It was an accident in the tithe-barn. I thought'—

'You thought?'

'That I should have died too. But we won't talk about it, please. What a pity she didn't put her full address at the top of the letter! Just "Clapham" is no more use than just "London," is it?'

Arnold supposed so; then took Willie in his arms. 'You're a nice little chap!' he said enthusiastically.

'And so're you, Mr Man,' said the boy.

—'Isn't he, mother?—You was found in the grass.'

They both smiled at the proclamation of this truth.

'But,' then said the boy's mother, with a charming wrinkle on her otherwise smooth brow, 'shall you think me rude if I ask you about something in the letter?'

'Of course not,' said Arnold. 'Try me with anything.'

'She mentions an H. C.—another gentleman. I—I gather that she didn't know her own mind. I'm so sorry for you. Were you engaged a long time?'

'Engaged! Who? Oh, *that*. Yes, I believe we were.' A tormented look came upon him. 'It's all over, whatever it is. That beast—Do you know, I think Dr Capper's right. I ought to be lying down somewhere. I feel—*here*.' Even with the boy in his arms he managed to touch the tiresome part of his head.

Mrs Brandon took the boy from him, and was as insistent as the doctor about his lying down. She left him on the sofa, with the blinds drawn.

This was the first attempt, and later ones were just as futile.

The initials A. W. on his handkerchief and other things were positively the only clue they had to build upon. Still, the doctor was very sanguine, and the farmer liked 'the Mr Man who was found in the grass,' and was willing to wait for a while. If it was all due to a love-trouble (as his daughter believed), it would surely come right in time. Mr Harcourt hadn't yet met the man, he said, that couldn't recover his balance after a simple shock of *that* kind if he kept off spirits and other nonsense. 'Mr Man' was welcome to board and lodging at the farm for one pound a week as long as his money lasted, and perhaps a week or two longer. The weekly pound was Arnold's own offer, prompted by Dr Capper.

And so it went on and on and on.

The hay was cut and carried, Arnold helping, and enjoying himself; the gooseberries and currants had had their little day; and a cloudless fortnight in July gave the wheat its mantling of bronze and gold, and quite settled the oats.

The farmer still liked Arnold, but was feeling uneasy about things now. He and every one except Mrs Brandon called Arnold Mr Mann, and he answered to the name. With two 'n's' to it the name was not so bad. The proposition came from Mr Harcourt laughingly, and Arnold said, 'By all means, as if there were nothing odd about it. 'Yes, of course I ought to be called something,' he admitted when the farmer made that excuse for the christening.

Peggy was the cause of her father's uneasiness; and the doctor, the Cherry-Tree servants, and most of the farm hands didn't wonder.

From the first she had taken special charge of Arnold, with a woman's tender interest in suffering.

They went to church together on Sundays, with Willie between them as a link to their hands. In the hayfield Peggy kept her blue eyes on him as well as upon her boy. The doctor avowed ignorance about the development of so unusual a case, and left all the responsibility to her. She thought it possible that Arnold might at any time have a seizure of some kind impelling him to throw himself into the river or strike some one. Although he was so sane in every particular save those missing essentials, she couldn't feel comfortable about him—and showed it.

This was what the farmer didn't like. It led so inevitably to other things. He remonstrated with his daughter, and was slightly soothed by her quick retort of 'How ridiculous, father!' But he had to remonstrate again and tell her that 'Mr Mann' must clear out soon, whether he remembered his name or whether he didn't; and this time Peggy was angry—as angry as she could be, which wasn't very angry. 'Of course he doesn't,' she exclaimed, when the farmer asked point-blank if Arnold talked to her about love and such dangerous matters. Mr Harcourt was still dissatisfied, but accepted the situation a little longer. 'First time he does, you tell me, my dear,' he said, 'and off he trots. I've no fault to find with him myself—knocks me hollow at manners. But that's just it. And he's a good-looking chap—you'll not deny that?' Peggy turned her head away and whispered that she didn't wish to deny it. It had nothing to do with her. They must all be patient, and she felt sure that something would soon happen. 'We can't send him to the workhouse, father. It would be *shameful*.'

Peggy never called him anything, and this would have been even more significant to her father than the other trifles had he been deeply learned in human nature.

She could not address him as 'Mr Mann' like the others. But she was delicious in her little artifices about names in general when they were alone together. She mentioned numbers of names, chosen from a dictionary, Christian and patronymics, always ready to fly at a symptom indicative that she had chanced upon one of the right ones. But she never hit either upon 'Arnold' or his other name, 'Wise.'

And now the harvest was ready.

'They're going to cut the Long Field to-morrow,' she told him one evening when they were sitting under the roses on the house, watching the sunset.

'Are they?' said he.

He had been very silent this day. Peggy thought it was the heat. He seemed in splendid health, except that his eyes had shadows under them, and he didn't talk.

'Yes. There was a gentleman here last year, an artist named Reginald Paterson. Why do you smile like that?'

It wasn't the first time he had smiled at her elaborate mention of other people's names, but hitherto she hadn't asked him why.

'Oh,' said he, with the smile gone, 'was I smiling? I don't feel like it, I assure you, Mrs Brandon.'

'Why don't you? I like to see you smile,' said Peggy. It was true, but scarcely a prudent confession. She wouldn't have said it if her father had been near, and a quick realisation of this coloured her cheeks.

Arnold's head drooped.

'You're not well. I'm sure you're not,' said Peggy earnestly. 'Do tell me what is the matter. Willie says he couldn't get a word out of you this afternoon—at least not enough words. Perhaps he bothers you. He's a greedy little boy—for attentions.'

'He's the jolliest little mortal in all the world,' said Arnold. 'And I shall be awfully sorry to'—— He sat up, and, as if without thinking what he did, put his hand on one of Peggy's in her lap. 'Mrs Brandon!' he exclaimed, looking into her troubled blue eyes—they were distinctly troubled now, though very beautiful.

Peggy nodded to encourage him. Her lips quivered. She was only twenty-four, and seemed less.

'I'm at my last sovereign, and can't stop here after to-morrow. To-morrow's Tuesday. I came on a Tuesday, didn't I? "The chap that was found in the water-medder"—that's what Dodson the carter calls me—I heard him calling me that to one of the maids in the cowhouse yesterday. Well, it's a good description, I suppose. But, I say, you've been most uncommonly good to me, Mrs Brandon; and so has every one; but it's all rubbish about my working off my board and lodging after to-morrow. I asked your father this morning. He said it would suit him better if I went.'

'No!' whispered Peggy, looking down.

'But I must!' His hand tightened on hers. It was an argument in itself, and she let it argue.

'How can you, when you don't know where to go?' Peggy asked, almost entreatingly.

'I can, of course,' he replied, with the shrug of a man conscious of his strength. 'I'm as fit as a horse. And, equally of course, I must. It'll be no end of a wrench, but'——

And then the farmer's voice, very harsh, sounded in Peggy's ears from the porch to the right.

'I want you *here*, my girl!' cried Mr Harcourt,

and Peggy rose with a start. Her hand came free without any restraint.

'Yes, father!' she said, facing him with troubled eyes, but much colour in her cheeks. 'What is it?'

'Come right into the house, and leave our young friend to himself,' said the farmer. '—It's no use telling you to pack up, my lad; but you know what we settled this morning.'

Arnold's eyes also were quite untroubled as he confronted his host of the past two months.

'That's what I've been telling her,' he said. 'It's all right, Mr Harcourt. I *quite* understand. I've had a splendid time.'

'Father!' said Peggy, with a hand on the farmer's arm.

But the farmer shook her hand off. 'Go indoors,' he said.—'And don't you, Mr Mann, or whatever your confounded real name is, lift your eyebrows at me in that superior way. You've had your last say to my daughter. I'll be glad if you'll get off to your bed, straight, when you feel like it.'

Peggy threw him a sad look with the wrinkle in it which he knew so well now, and went indoors.

Arnold sat down again. 'All right, Mr Harcourt,' he said, without any show of resentment; 'I'll smoke one pipe and then to bed.'

(Continued on page 327.)

THE ANTI-AIRSHIP GUN.

By BREECH-SCREW.

THE French, during their war in Morocco, used a captive balloon for purposes of reconnaissance. The sight of this mysterious object in the air filled the minds of the Arabs with a great fear, and they fled forthwith. 'What is the use,' said they, 'of fighting against these infidels when Allah allows them to pitch their tents in the skies?' After an absence of several weeks they returned, having in the meantime discovered all about this strange craft. Later on they perceived that wherever the balloon was, there also was the French position. So the French pulled down their balloon, packed it up, and sent it back to Paris.

Now there rests to-day in the Arsenal at Berlin, the handiwork of the gunmaker, a gun which during the siege of Paris drove the captive balloon from the sky by day, and forced it to appear only at night. The gunmaker has therefore little to fear from this kind of craft. For many years he has been engaged in what would appear to be an interminable contest with the steelmaker. At times the velocity of his weapon was able to overcome the toughness of the steelmaker's plate; at times his piece was outclassed. In the midst of this contest he has been called upon to design a gun to meet, not armour, but a small, frail craft whose unrivalled speed fills him with amazement and despair.

He has constructed such a piece—the anti-airship gun he calls it; and though he hopes it will deal successfully with the dirigible, he feels doubtful, and even despondent, as to its chances of ever hitting the aeroplane. He deplores the fact that those splendid weapons of his, the field-gun, the heavy field-gun, the howitzer, and the armaments of fortresses, are not equal to the emergency brought about by the advent of aircraft.

After all, the gunmaker must know that his

newly forged piece is but a baby in design and in effect, for it has been in existence for not more than five or six years. The aeroplane, too, is only in its childhood, unless indeed we date its birth back to the day when the sun melted the waxen wings of Icarus on his flight from Crete. The dirigible is, at least, a centenarian; so long ago as 1812 a German named Leppich fitted to his balloon wings worked by hand-power, but he never succeeded in flying against the wind.

Before describing the anti-airship gun it is as well to consider two things—first, the capabilities of the craft it has to engage; and, second, why such a special weapon is needed to attack those craft.

The German dirigible Zeppelin L.1 has a speed of fifty-two miles an hour, it can rise in the air at the rate of some twelve hundred feet a minute, and it is able to vary its speed, twist and turn in the sky, and hang inaudible over its prey. It has, however, a safety-limit of rise, owing to the effect of lessened air-pressure on its envelope. It can drop six hundred pounds of explosives at a time without affecting its stability. Some idea of its size may be gathered from the fact that it affords the gunner a target about three hundred times larger than does the aeroplane.

The normal speed of the heavier-than-air vessel is from fifty to seventy miles an hour, but one hundred and twenty miles have been covered in that time. Its rate of rising—namely, from two hundred to four hundred and fifty feet a minute—is slower than that of the dirigible; but the height to which it can rise is limited only by its pilot. It has little or no 'flexibility,' and so cannot alter its speed while flying; though there are some machines which possess such a speed variation. The Flanders monoplane, British built, has a speed varying

from forty-one to sixty-seven miles an hour; the B.E.2 machine showed a slightly greater 'flexibility.'

The size of the aeroplane is limited; it is extremely doubtful if this machine will ever exceed some few tons in weight unless a great advance be made in engine construction. The heaviest machine in the French military trials of 1911 was the Antoinette monoplane; its weight, fully loaded, was about twenty-seven hundredweight. The vulnerable area of the aeroplane is probably not more than 2 per cent. of its total. It seems likely that two types of machines will be used in war—namely, light and very swiftly moving craft for attacking dirigibles and other air-vessels, and slower and heavier ships for reconnaissance duties. The first type is not common at present; but in the near future it will be so, and some gun or other will have to engage it.

On reconnaissance work the aeroplane must carry at least two men, for the pilot cannot attend to his craft and at the same time observe the terrain. If the pilot fly his machine too high, then the observer who accompanies him will see little or nothing; so that when he is spying out the land the height of flight must not be more than some four or five thousand feet; taking it for granted, of course, that the observer is experienced and the weather conditions favourable.

During the German manoeuvres of 1912, their flying squadrons were ordered to keep at a height of three thousand four hundred feet or thereabouts when moving over troops. The French believe that they will be immune from gun-fire and able to see well at an elevation of two thousand feet.

In view of these somewhat conflicting opinions, it is interesting to know the experiences of aviators in war. In the Tripolitan war the Italians considered an elevation of two thousand feet sufficient. Their pilots, who did not carry observers, found that at this distance from the earth they were able to reconnoitre well and were not troubled by gun-fire, and that their machines were not affected by the disturbance of air caused by the explosions of the Italian heavy naval shell below.

In those excellent papers *Flight* and *The Aeroplane* there lately appeared most entertaining accounts of the work done by the 'avions' of the Greek army in the Balkan war. Lieutenant Camberos flew fifty-two miles at a height of five thousand feet, and brought back information of the highest value; another officer gave complete details of the fort of Bisani, which he observed from an altitude of seven thousand feet. The speed of the machines used by both of these countries varied from fifty to seventy miles per hour. The Bulgarian airmen found that they were beyond the range of any Turkish weapon, and could perform intelligence duties satisfactorily at a height of between four thousand

five hundred and five thousand feet. Not a single aviator was killed and not a single machine incapacitated by gun-fire during these campaigns, the only casualties which occurred being due to the rifle-bullet. One of the Greek biplanes was hit by shrapnel-bullets, and the tail boom smashed; but it continued to fly, and landed safely. It is but fair to the anti-airship gun, however, to state that it was not employed by any of the combatants mentioned.

From what has been said regarding the powers of aircraft, we can now lay down certain qualifications which a gun must possess to be capable of engaging them. Those qualifications are: the gun must be able to shoot at vessels flying directly above it, must have an all-round field of fire and great rapidity and accuracy of fire, and possess considerable mobility. It requires, too, in addition to many other things, special ammunition—a shell to leave a smoke-trail after it in its trajectory, and a fuse sensitive enough to act on the envelope of a dirigible or the wing of an aeroplane. Now, no piece at present used in the field or elsewhere possesses all these qualifications; and although modifications are being carried out by some countries—notably France and Italy—on their field-guns, it is universally recognised that none of these weapons, even when so modified, is suitable for use against aircraft. It is not to be supposed, however, that no attempt will be made by these guns to attack air-vessels; the unforeseen sometimes does happen, and a lucky shot is always possible, but the enormous expenditure of ammunition will certainly not be justified by the meagre results obtained.

The anti-airship gun, therefore, had to come, and it has come, and every year, no doubt, will see extraordinary improvements made in its construction. Eventually it will be brought to such a state of perfection that it may, perhaps, banish aircraft from the skies. At night it will engage air-vessels with the aid of a powerful searchlight, trusting to the eyes and not the ears of its gunners; for by then all airships will fly silently—no hum of engines will be heard—and at a speed which would astonish the most optimistic of present-day pilots. But that time is not yet.

One of the best weapons made to-day comes, like many other good things, from Germany. It is a three-inch gun, has an all-round field of fire, and can elevate to seventy-five degrees. Its vertical range is twenty thousand feet, and it carries over land for about six miles. Its shell, which weighs twelve pounds, has a special fuse, and leaves a smoke-trail after it. This piece has a high velocity, and fires thirty rounds a minute. It is mounted on a travelling platform which can be carried about in an armoured motor-car. The gun, platform, sixty shells, and six men weigh four and a half tons.

The French have a somewhat similar gun, except that the weight of the shell is eleven pounds. This cannon is mounted in and fires from a specially constructed motor-car. Two jacks, fitted permanently to the rear of the car, are screwed down until the hind-wheels are raised off the ground, so that there will be no strain on the car when the gun fires.

The super-Dreadnoughts of the 'Wasp' class, now building, are to be armed with a weapon to deal with aircraft. From the short description given of the two pieces, it seems evident that the gunmaker has turned out a weapon which to all intents and purposes is the perfect anti-airship gun. Why, then, is he despondent about hitting the aeroplane? As this gun has not yet appeared in war, we are compelled to gauge its capabilities by its performances in peace. Its trials have been most disappointing. From experiments conducted abroad—in America, France, and Germany—it was considered that the hitting of an aeroplane by an anti-airship gun would be a matter of chance, but that it would be possible to bring down dirigibles with this gun. The great difficulty in peace is to find a target suitable for

testing the powers of this weapon. In the majority of cases the mark was a balloon or large kite, towed by a fast destroyer—very feeble substitutes for a machine whose chief attributes are its great speed and 'invulnerability.'

It may be possible to arrive at some definite conclusion regarding this gun when the aeroplane can manœuvre in the air without a pilot; up to the present it has performed this feat only in America. Last July at Redwood City, on San Francisco Bay, an aeroplane, shortly after being started, bumped its airman out of his seat, flew out to sea, and was lost. While deeply sympathising with the pilot, one cannot help thinking that the American gunner missed a splendid opportunity on that occasion.

Perhaps the gun is efficient, and its detachment, being not yet supermen, utterly incapable of dealing with so small and so speedy a target. If such be the case, the gunmaker must make up for the defect in personnel by vastly improving his matériel. He must gradually replace the human element by mechanism so ingenious, so wondrous, that the marvel of some future age will not be aircraft, nor any other thing, but his gun—his anti-aero gun.

ATLANTIC GOLD.

CHAPTER I.

AT seven o'clock Arcus broke from the inertia. He bathed, donned fresh linen, and prepared to go out of doors. From the hall, however, he saw Hubert in the sitting-room.

Hesitating—'How is Dr Helmsdale now?' he inquired from the doorway.

Hubert smiled cheerfully. 'He is better, sir. Only his eyes a little sore. I have just taken him tea. I will fetch you some at once if you will be seated.'

Arcus entered the room—unwillingly perhaps. But he wanted tea—anything. Few of us are prepared to starve because our host happens to be a criminal.

'I shall not be one minute,' said Hubert, departing.

Arcus glanced at the laboratory door. A new lock had already been fitted. The sitting-room was in its usual morning state of orderliness. The event of a few hours ago might have been a nightmare. He sighed wearily. Then his gaze fastened on a photograph of Florence, taken at nineteen, a slip of womanhood, yet with much of the charm that bound him now. His heart rose. Whatever happened, she was his to hold and protect here and hereafter. Nothing mattered—nothing mattered so much—as that!

He watched Hubert when the man returned with the tray. There was nothing furtive about the smooth, rosy countenance and clear blue eyes. Was it possible that he, too, was innocent?

'Miss Helmsdale sleeps, I think,' Hubert observed, offering sweet biscuits of his own make. 'We all got a great fright last night. But it is past. Now it is a fine morning—small breeze, but not cold. You will go out, sir?'

'Yes, Hubert,' said Arcus. He liked the man; he hoped Hubert was innocent. 'If Miss Helmsdale comes from her room soon, let me know, Hubert. I shall not be far away,' he said, taking a biscuit.

'Very good, sir;' and, with his little bow, Hubert withdrew.

Arcus went back to the portrait of Florence. Before going out he borrowed a file and pair of pliers from Hubert.

Florence did not appear until breakfast had been served. She came into the room with a shy step and a proud head. The heaviness of her eyes belied the flush on her face. All night, with all her solicitude for her uncle, she had been sensible of the strange, shocked stare of Stephen. Without greeting, she began to explain that she had persuaded her uncle, though almost himself again, to remain in bed for a couple of hours; that Hubert had already taken up his breakfast; that—

'Florence!' cried Arcus, 'have you forgotten?' He took her in his arms. 'I thought you would never come. Beloved, I thought you would never come!'

She did not resist; she could not. And at

his eager kiss the indefinable doubt fled. No wonder he had stood speech-bound and staring at their last meeting! Was it not he who had suffered the greatest shock? Her arms stole round his neck. She kissed him, wholly trustful.

'Stephen,' she whispered, 'you are doubly dear now!'

It is to be feared that Hubert's dainties were neglected this morning. There were long silences, too, chiefly on the man's part.

'Last night has upset you, Stephen,' she said presently. 'You must not think about it. What would you like to do this morning? I'm afraid we are going to have wind, or I would suggest a row round the island. I wish we had the large boat.'

'Let us go to the Woman's Cliff. I want to be alone with you, to talk with you. How soon will you be ready?'

'As soon as I have seen uncle,' she said. 'I will go to him now.'

At the door of the house he awaited her return impatiently, yet with a certain nervousness. That he should be the one to tell her the truth about her guardian was unthinkable; at the same time he feared lest in some way he should betray his secret. Sooner or later she must learn the truth—he could perceive no escape from that; nevertheless, he would endeavour so to prepare her heart that it should not suffer the full force of the blow.

'He hopes to see you at lunch,' said Florence as she joined him. 'I could not get him to promise not to go into the laboratory. He is very stubborn.' She laughed a little. 'I suppose I ought to be miserable and worried about him; but somehow—somehow everything is different now. You give me such a strong feeling of safety'—She halted, looking at him with shy, honest eyes.

'I!' He winced slightly. 'Of course!' he went on with an attempt at lightness; 'but you'll get used to that feeling! You are bound for a life of safety now, dear. Come, let us go to the cliff. I have something to give to you—something to say.'

The rough walk invigorated them both. It was a happy girl, and a not altogether unhappy man, who sat down together under the horn of rock overlooking the sea, whence the mists were being swept by a mild westerly breeze.

Arcus drew a shining object from his pocket—his watch-chain, which he had converted into a bangle during his early outing—and laid it in her lap.

'As there are no jewellers' shops on Laskeir, and as I have nothing else to offer you, will you take this, dear Florence, until I can give you a ring?' he said.

For a moment or two she regarded it uncertainly. Then, with a whisper of thanks,

she took it up and slipped it over her left hand.

He kissed her tenderly. 'Is it too slack?' he asked.

'I shall not lose it, Stephen.'

'Were you not quite sure about putting it on? You seemed to hesitate.'

She caught his hand. 'Don't think me too foolish; but—but the Norwegian woman came into my mind. She's gone now! Dear, you won't mind if I take it off sometimes! You understand? I feel mean, but I can't tell Uncle Victor just yet.'

'Of course I understand, Florence. But why do you brood on that Norwegian woman, who probably never existed?'

'I expect this is the end of her,' she said, smiling into his eyes. 'You see, I've had her for years, and you for only a week. Oh Stephen, is it really all true?'

'Oh Florence!' he cried, 'do you love me more than a little?'

'You know it,' she sighed.

'More than all in the world?'

She answered, drooping, 'I'm afraid I do, Stephen.'

He held her close and said unevenly, 'Florence, do you love me enough to marry me at once?' he said.

'At once?' She was startled.

'At the earliest moment possible. When a ship comes I must go with her, but I will come back in a few days, and—ask you to go away with me. Will you be ready, Florence—and willing?'

'But, Stephen!' she exclaimed, amazed.

'We have been together here only a week, yet we have seen as much of each other as many lovers see in a year. Don't let that'—

'I wasn't thinking of that. I was thinking of Uncle Victor.'

'I think I can satisfy him that I am fairly respectable and able to'—

'Oh my dear, it's not that either! I—I cannot leave him till his work here is finished.'

This he had expected her to say; he loved her the more for saying it. He hated himself for his reply. 'Suppose he were perfectly willing that you should marry me at once, Florence, what then?' He saw himself threatening Helmsdale, and the idea was nauseating; but he must not falter.

'Stephen!' She was hurt by his words, yet proud of his eagerness.

'Dearest,' he said, 'you must think me a selfish brute. I suppose I am. I want you far more than I ever wanted anything in life. If I have not you I have nothing. Dr Helmsdale has—well, he has his—work. Of course he would miss you, as you would miss him; but would it be any harder for him now than a year hence? And if he should say "Yes" to my request when I return here—or before I go, if

you will let me speak then—will you not say "Yes" too? Oh Florence'—

'Hush!' she commanded gently. 'You give me too much to think of all at once, Stephen.'

'Don't you trust me?'

'That is rather a foolish question now, isn't it?' She touched the chain on her wrist. In a confiding way that moved his being she slipped her hand into his, saying, 'Please don't speak for five minutes.'

The charm of her presence as she gazed seaward soothed his anxiety and quieted his impatience. For a little while—the hateful thing forgotten—he experienced the pure rapture of possession.

'Oh!' she exclaimed, starting and pointing. 'A steamer!'

Out of the tattered haze came a whaler, a little, narrow, black craft, with harpoon-gun, loaded and ready, pointing over her bow. She was making to pass the island at fairly close quarters, on a northerly course.

In dull fashion Arcus stared at the apparition.

'Dear!'

The word brought his gaze to her face. Her eyes were brimming. 'Florence, I'—

She cast her arms round him. 'Dear, don't go—don't go!'

In her embrace he wavered, struggling against desire. Life here might be very sweet in spite of an ugly secret. Why not compromise with Helmsdale? No, no! he could not sink to that. He must go now—now, in order that he might come again empowered to demand this woman for his wife, to make her his wife, by a wedding at sea if necessary.

'When I come back will you be ready?' he asked in her ear, his soul in the whisper.

When he had asked thrice she gave in. She could not say him nay. She had yielded up herself so utterly, she trusted him so implicitly.

'I will tell Uncle Victor after you are gone,' she said, as they rose perforce to depart. 'That will be easier for us all. I—I am not afraid of him. He owes you his life. But I—I am sorry for him, Stephen. He needs a woman by him.' She paused. 'But we shall see him very often after—after— We shall come to stay with him, shall we not, oh Stephen, my dear?'

In silence, hating himself for a hypocrite, Arcus pressed her hand.

(Continued on page 324.)

FIGS.

TANTALUS, suffering the tortures of the nether world, tried in vain to reach the sweet figs and dark olives that lay just beyond his grasp. This, in Homer's *Odyssey*, is one of the first references in profane literature to the fig. In Hebrew Scriptures the fig is frequently mentioned as an edible fruit, and there is a strong probability that, as it was peculiarly suitable for preserving, its cultivation had been going on even before the *Odyssey* was written. It is believed that its culture was understood among the Babylonian cities in the valley of the Tigris, to which in the very distant past it had found its way from its original home in south Arabia. In very early times, at least seven hundred years before the Christian era, the edible fig grew in the Greek isle of Paros, into which it had probably been introduced from the mainland of Greece; and doubtless it came to Greece from Asia Minor (more likely than through Egypt and Crete).

In later times Attica was known far and wide for the delicious flavour of its figs, and laws were passed forbidding their export; officers being specially appointed to see that the enactments were duly observed. These officials, who came to bear the name of 'sycophants' or 'fig-revealers,' soon fell into ill repute from their levy of blackmail upon suspected persons, and their name is now synonymous with common informer and parasite. Xerxes, King of Persia, cast a covetous

eye upon the province which could produce such fair fruit, and at length, in the determination to make it his own, he ceased to buy his customary supply of the delicacy, so as to hasten the anticipated enterprise by increasing his desire. But the battle of Salamis brought his ambitions to nought—hence the somewhat obscure aphorism that one should rather buy than grow one's Attic figs.

Figs have found their way into almost every district immediately north and south of the Mediterranean. The Phœnician merchants as early as the fourteenth century B.C. had colonised many islands of the inland sea, carrying with them the culture of the fig; thence they passed the Pillars of Hercules, taking the fruit into Portugal, and as far north as the Channel. It is, however, to the Arab invasion of one thousand seven hundred years later that these same countries owe their finest kinds of figs, for when the Arabs had made good their footing on both sides of the Mediterranean they took the latest varieties with them; and the excellent figs of Portugal, particularly of Algarvé, which for hundreds of years enjoyed a monopoly of the British market, are sorts first introduced by the Moors.

The finest figs are now the produce of the districts served by the port of Smyrna, and any edible figs which reach this country from other sources are a negligible quantity. The elemes and locoums, packed respectively in layers and in

cubes, are—especially the latter—by far the best the world produces; and it is the Smyrna fig which has been introduced into California, and grown there with success.

A fig is a congeries of fruits rather than a simple one. It consists of a hollow bag, within which are a large number of tiny fruits, each with a single seed. And, similarly, before fruiting, the bag contains an even larger number of flowers, male flowers and female, gall-flowers and mule, each having its own peculiar function, but none ever seeing the light of day. The structure of the fig may perhaps be best understood by imagining the receptacle of a daisy, with all the yellow and white florets upon it growing on the outside edge upward and inward like a closing hand, till the florets are encased in a dark cavity, opening to the air by a single small hole.

Everybody knows that the female flower, of whatever species of plant, has as a general rule to be pollinated before seed can be set, and that both pollen and receptive stigma must be at a particular stage of maturity before fertilisation can be effected. Yet it is the case that within any one fig the male and female flowers are never ripe for their functions at one and the same time; and herein is Nature's plan for the prevention of self-fertilisation. But how, one may ask, can the desired cross-fertilisation be accomplished for flowers shut up in a dark receptacle, whose only entrance is very small, and defended by a rampart of scales? The flowers of the field, by exquisite colour or sweet odours, draw to their aid the bees and butterflies, which profitably but unconsciously perform the task of pollen-bearing for them. The fig goes farther. It is not a trifling bribe of nectar that it offers to its insect ally, but food and lodging from beginning to end of its existence. The insect is the fig-wasp, *Blastophaga grossorum*, a tinier specimen than its name suggests. Colonies of them live in the wild caprifigs, in which Nature has provided very special modifications to enable them to lay and hatch their eggs; for in two out of the three annual crops of figs each receptacle contains a number of the so-called gall-flowers, whose styles are shortened and ovules aborted to suit the necessities of the guest. In them the wasps deposit the eggs, and those tissues whose normal function is to protect a seed grow round the developing embryo, forming for it a protective covering. To such a degree has the gall-flower become identified with this function that if no egg is laid in it, it shrivels up altogether. In due time the young wasps come to maturity. They are, let us suppose, those in the first crop of figs, or *profichi*, as the Italians call them. The males may remain in the fig; but their partners, anxious to seek young figs in which to deposit their eggs, struggle to gain an exit. In doing so they unconsciously set in motion cunning Nature's device to secure to the plant its share in the scheme of mutual benefits; for round the orifice the pollen-bearing flowers are

set, and the wasps, in their scramble to get out, cover themselves all over with pollen-dust. The sequel is obvious. Immured once more in a young flowering fig of the second, or *fichi*, crop, the wasps run round searching for gall-flowers—which at this stage they never find—and incidentally convey to the female flowers the pollen that fertilises them. Seeds are in consequence produced, and the life-cycle of *Ficus carica* is complete. It would appear that the *fichi*, or midsummer crop, are exclusively subservient to the requirements of the fig, for the wasps derive no advantage from them except shelter. No gall-flowers are provided; and if eggs are laid in the long-styled female flowers, they are never hatched. But the completeness of the reciprocal benefits in this wonderful symbiosis of insect and plant becomes apparent when the *mamme* or September crop of figs appears. Not only does it provide an abundance of gall-flowers in which eggs are laid and hatched, but the small, dry fruits become the winter quarters of the young wasp colony. There they are safely housed till spring reawakens activity, and, with a general migration to the *profichi*, the first crop of the year, the round of events commences again.

It will be noticed that this account is confined to the wild species or caprifig. The edible fig, producing no gall-flowers, cannot subserve the purposes of the wasp, and therefore cannot receive full benefit in return. And so from time immemorial it has been the custom in fig-growing districts to hang caprifigs upon the branches of cultivated fig-trees in spring, so that the wasps emerging from them may enter and fertilise the flowers of trees which harbour no insects of their own. Ignorant peasants, not comprehending the significance of the custom, have been found to hang oak-galls and such-like growths upon their trees, apparently in the belief that some supernatural agency was at work. Some eminent botanists, including Kerner, have discountenanced the whole process of caprifigation, believing that an edible fruit will mature, though of course without seed, whether the flowers are pollinated or not. It may at once be said that there are very many species, including those grown in our own country, which do produce what is clumsily called a pomological fruit—to distinguish it from a true fruit with fertile seeds—without the mediation of wasps; but it is the experience of the highly trained experts of the United States Agricultural Department that, for the Smyrna kinds, which almost alone are of commercial value in Britain and America, caprifigation is a necessity. Smyrna fig-trees were grown in California for years before a single eatable fruit was produced; but no sooner had caprifigation been resorted to than figs of excellent quality were obtained. And it is scarcely likely that the experienced growers of Smyrna would incur the expense of importing shiploads of caprifigs from the Greek Isles, when their own supplies have been destroyed by

frost, unless they felt convinced that the process was a real necessity. We may, then, regard this fruit as in part an artificial product, since it is only by the intervention of man, regularly performing a function which Nature as regularly omits, that it can be grown in its most perfect form.

To the Greeks the fig, with its hidden flowers and luscious fruit, was a symbol of fertility, conspicuous in the celebrations of the worship of

Dionysus, to whom a basket of the fresh fruit was offered, with every mark of the esteem in which it was held. It has now fallen upon a more commercial and less poetic age; but with an increase in at least a knowledge of facts, we too may look upon the fig as more than a mere pleasure to the palate. For, while it reminds us of the civilisations of the past, when it was held in superstitious regard, it also typifies in its individual history Nature's inscrutable ways.

THE SPIRIT OF THE ORDER.

By W. G. LEFT.

SOMEWHERE in one of the enormous number of military handbooks the opinion is expressed that it is highly desirable for officers to pay attention rather to the spirit than to the letter of an order. No one, I suppose, is prepared to cavil at that excellent maxim, and prefer the poet's aphorism, 'Theirs not to reason why;' certainly not the distinguished general officer whose orders in the following episode were obviously disobeyed.

Now, though the Westrian invasion of England has long been a thing of the past, there are yet many occurrences connected therewith that remain mysteries. Most of these will probably never be elucidated; but I am able to give here for the first time the true facts of perhaps the most extraordinary of these, and one which certainly at the time created an enormous amount of comment. I refer, of course, to the sudden and hitherto inexplicable disaffection of Estrenia, the most powerful of the Westrian states. Every one knows how almost at the inception of the war the Estrenian troops suddenly withdrew from the fray and ceased to fight against us, without, so far as we know, ever receiving the punishment which such apparently traitorous conduct merited at the hands of the Westrian nation.

Great results frequently have small beginnings, and this story commences in Captain Peterson's tent on the afternoon of the 23rd of January, some three weeks after the commencement of the war.

Dick Peterson, D.S.O., had just returned from one of those innumerable scouting expeditions which gave him the reputation of being one of the greatest scouts in the service. He pulled off his boots and mud-stained garments, and sought the luxury of which he had been deprived for forty-eight hours—a cold bath. But although two days and nights of scrambling and crawling well deserve some reward, and certainly a rest, he was not destined to enjoy either that afternoon; and his ablutions were suddenly interrupted by the sharp smack of a stick on the outside of the tent-canvas.

'Are you there, Peterson, old man?' a voice cried.

'No; I'm out, if you're looking for me, Tyans. Come in and see for yourself,' the scout chuckled. 'Now then, you bird of ill-omen,' he continued as that officer entered, 'what do you want, eh? Help yourself to a cigarette; you'll find some in that old tobacco-box on the camp-stool.'

'Right. Thanks very much. Got back safe and sound, I see,' said Captain Tyans of the General Staff, removing the tobacco-tin and setting himself in its place.

'Yes,' Peterson told him. 'Just arrived home after a pretty rough time. I shall be glad of a rest for a bit now.'

'You won't get it, I'm afraid.'

'No! Why?'

'Promise you won't kick me out when you've heard what I've got to say; and you've got a pair of boots on those dainty feet of yours.'

'Honest, I won't. I'm going to put on a pair of slippers for a bit.'

'Sorry I shall have to put a veto on that luxury too. Look here, Peterson, Artie's got another job for you.'

'What is it?'

'All he said to me was, "Tell Peterson I want him at once."'

Peterson heaved a sigh. 'Somewhere or another I seem to have heard of an Early Closing Bill. Didn't the two houses of Parliament decree that everybody was to have a half-holiday once a week?'

'Quite right, my boy. You're thinking of civil law; but this is the military variety.'

Peterson nodded. 'Now you know something more about this business. You staff chaps with the pretty little red patches on your collars know everything.'

'All I know is that a captured Westrian despatch came to hand just now, and that the moment the General saw it he was mightily excited, and sent me off for you.'

Five minutes later the two officers left the tent, and made their way through a camp whose inhabitants, knowing, as all trained soldiers do, that any moment may call for the utmost degree of exertion, were taking what rest was possible

amidst the multitudinous duties which fall to the lot of all on active service.

But though of all men the scout most needed repose, his step was as springy and his carriage as erect as ever, and his utter weariness only showed in the haggard face, with its deeply graven lines. They crossed the horse lines of the White Huzzars, through the bivouacs of the Norfolk Fusiliers, jumped the little stream in the hollow, and stepped up the sloping bank, on the top of which the Union-Jack floated over a small group of tents.

General Sir Arthur Rollics, K.C.B., irreverently known as 'Artie,' was sitting at a table in his tent scrutinising something before him with the aid of a magnifying-glass.

He looked up as the scout entered. 'Ah! Good-day, Peterson. Your report to-day contained very useful information. I suppose you want a night's rest before you do any more work, eh?'

'I can get that after the work, sir. Do you want me again?'

'To tell you the truth, I do. I've no one else to use on the job. I'd have let you off and sent Thomson, but he's gone now.'

'Indeed! Dead, sir?'

'Oh, I don't know. We never know with you scouts. Snaffled, perhaps. You've got the pluck of the devil, but you're all too venture-some, I'm afraid.'

'A good epitaph for a scout, sir.'

'Ah, yes, quite so. Look here; you can read Westrian, can't you?' The General pointed to the scrap of paper before him.

It was frayed and ragged, showing but a broken sentence in Westrian, '... who will take command on arrival. You will ...'

'A chap was trying to slip through with this from the north,' the General said, 'but the Tommy who caught him noticed he was eating, and was curious enough to prise his teeth open with a bayonet. Well, what do you make of it?'

'A message from the Westrian commander-in-chief to Marshal Hemmetz at Rushton, I expect, sir.'

'So I should think. What bothers me is why on earth they should want to remove Hemmetz, the best man they have.'

Suddenly the General brought his clenched fist with a crash on to the table: 'You must find out why, Peterson. I've got to know if Hemmetz is really to be sacked.'

'Very good.'

The General was muttering to himself, 'I've got to know. I know thoroughly the sort of tactics Hemmetz invariably employs—know what he'll do almost as certainly as if he'd told me. If he remains in command I can— But no; supposing somebody else commands, that manœuvre would be a ghastly failure maybe.' He rose to his feet: 'At all cost, Peterson, you

must let me hear at the very earliest moment who commands at Rushton.'

'Very good, sir.'

'I need not tell you how important it is. As you know, the whole art of strategy is thoroughly to understand the man you're pitted against. Get off as soon as it's dark. Good luck!'

'Thank you, sir. Good-day.'

As Peterson walked slowly back to his tent a few drops of rain falling from the lowering clouds warned him that his work that night was not destined to be performed in comfort. Yet he hailed the promised storm with delight, for the scout loves the darkness and the gloomy downpour that save him so much trouble and danger.

'I'll not bother about feeding with the other officers to-night,' he told his servant. 'Just fetch me some food over here at four o'clock, and wake me then. I'll have the black horse to-night.'

'Very good, sir. I'll give him an extra feed of corn now.'

But Peterson had thrown himself upon his open valise, and was asleep before his servant finished speaking.

He was awakened by the man shaking him.

'Four o'clock, sir. I've got some soup and cold chicken here, sir.'

'That's right. Spread the six-inch ordnance map in front of me while I eat.'

Thus with each mouthful of food that he took in Peterson absorbed the knowledge of the locality over which he was to wander in the darkness; and when, an hour or so later, he climbed on to his horse he was quite independent of the map and almost knew every hedge by sight.

The rain was swilling down in torrents as he jogged past the few feeble fires that served but to call attention to the misery of the men who sat about them on the sodden turf.

He pulled up presently at the examining-guard on the main Rushton road, to find that a patrol had just returned.

'Nothing moving for five miles ahead,' he was informed.

Surely there are few more nervous jobs in the world than that of the soldier who, taking his life in his hands, goes forth alone into the unknown, beyond all possibility of help save what his own brain and strength can give. Small wonder, then, if Peterson's eyes and ears were on the alert as he rode forward.

But though the report had not impressed him greatly and he placed little reliance upon it, it proved trustworthy enough, and he had travelled at least six miles before a distant sound caught his ears, and he realised that four horses, followed at an interval by other horses, were coming rapidly towards him from his right rear. Peterson's knowledge of the map told him that

just beyond where he now sat listening the road from the little fishing-village of Bereton crossed his road, and bent back through Haffam to enter Rushton from the west.

Something most unusual must be in progress. No patrol, Westrian or British, would travel at this pace and with this noise through the country lying between the two opposing armies. For a patrol's duty is to see and hear without being seen or heard. Peterson's grim lips tightened. Why were these four men, followed by the others, thrusting through the darkness in defiance of all military rules? Surely something unusual must account for such unusual action!

There could be but two explanations. One he discarded at once, for his trained ear recognised that this was no pursuit when the second party followed the first at the same pace. The other must be the true reason; the four rode as an advance-guard to those others.

Just ahead of him, at the corner of the cross-roads, a thick holly-bush offered concealment for man and horse, and in a moment its shade had engulfed the British scout. He leapt to the ground, and covered the head of the horse with a fold of cloak lest a neigh should betray him. The four horsemen came suddenly into view, hesitated for an instant, and then, in obedience to a sharp Westrian command, passed onward along the road to Haffam.

If Peterson was to discover the meaning of the mystery, he could only do so from the second body of soldiers now rapidly approaching. *To do so he must join them.*

Those who study human nature—and what scout worth the name does not?—know that the vast majority of people hate to exercise their brains unnecessarily, and in consequence almost invariably accept the easiest explanation of anything that occurs, especially when their thoughts are centred on some special business.

In that dim light, and cloaked as he was, the British uniform was almost indistinguishable from the Westrian, and Peterson determined to give the enemy an opportunity of thinking him one of their advance-guard.

Quickly he led his horse out into the road again, and picking up the off forefoot, bent down over it as if extracting a stone. Thus the second body of Westrians found him. They paused, and Peterson's heart thumped madly in spite of the iron control in which he held himself. Did they note something strange about him?

He dared not speak in his halting Westrian, but with an effort he straightened himself and waved his hand in the direction taken by the advance-guard. Another pause. The sweat started in great beads upon his forehead. Then they spurred on once more, and Peterson, leaping into his saddle, rode onward through the night with the Westrian soldiers. Even if he never learned the matter on which they were engaged, he knew that with them he could pass

in safety through the enemy's outposts, and thus be saved considerable trouble and not a little danger.

The men immediately about him seemed dumb, for they never uttered a word; but presently fragments of conversation reached him, though the men speaking rode in the middle of the party, and were too far off for him to grasp what they said. Slowly and imperceptibly the scout managed to work his horse through the ranks until at length he rode just behind the speakers.

'Your Majesty wishes that to be done!'

Peterson started, and barely repressed an exclamation. *The taller of the two figures must be the Emperor of Westria.* True, no one had ever dreamt that the Emperor himself would take the field. Yet why not? Was he not just the man to do so?

Now Peterson seemed to understand who was to take the place of Marshal Hemmetz, and why this strange party came from the direction of the fishing-village. The Emperor must have landed there.

Here was the man above all others responsible for the invasion—the man whose existence threatened Great Britain. Can we blame Peterson, then, if the thought of how his country might be saved by one shot from his revolver surged through his brain for a moment?

'All is fair in love and war,' they say, and I do not know whether or no the scout would have been justified in firing that shot. We may be sure that his failure to do so cannot be put down to the deadly danger in which such an action must have involved him.

He himself says, 'I'd have liked to do it. They'd have killed me like a shot if they'd known who I was. So why shouldn't I have killed him? I thought of the many men I should save from death and the mutilation of wounds, of the countless women whose tears need never be shed. I got my finger on the trigger then. But all at once I knew it was not playing the game. I reasoned with myself. It was no good. I could not do it. Funny, wasn't it? So I rode on like a fool, letting that chap get safely to his own side, and wondering how on earth I could stop him.'

But luckily for Peterson, and for Britain too, there were other fools abroad that night. Of a sudden the sharp rattle of shots ahead rent the air, followed by a hoarse scream that ended in a groan. A figure swaying strangely in the saddle rode rapidly back towards them.

It may have been a Westrian patrol that fired. It is to be hoped that it was not a British one which so far forgot its purpose as to force a fight.

Peterson never knew, though at the moment he cheerfully gave the blame to Britain, and rising in his stirrups, yelled, 'The British! Save yourself, your Majesty!'

One can well imagine that at once confusion reigned supreme. The man whose every move-

ment the scout watched swung his horse at the right-hand hedge, and cleared it. Peterson drove his horse at the obstacle. Something caught the animal and broke. A slip as the horse pecked on landing, then he, too, was in the field, and flying after the dim figure ahead. Oaths, curses, and the sound of further shots echoed behind.

All Westrians have the reputation of being magnificent horsemen. Perhaps that is correct only in the daylight. At any rate Peterson's hurried glance backwards only perceived three followers. But the reputation of the nation was certainly safe in the hands of the man ahead, for he pushed his horse straight at the five-barred gate in the next fence.

Peterson set his teeth and followed. Considerably to his surprise, he landed safely in the ploughed land on the other side. Another backward look showed him that though the three horsemen still followed, the distance which separated them was much greater. Gradually but surely the horse which Peterson rode gained on the one ahead, until at length it drew alongside.

As they raced onward through the heavy ploughed land the misty shape of Thornley Coppice loomed before them. It was just the place to suit the project forming in Peterson's mind.

Though his imperfect Westrian had passed unnoticed in the confusion, the scout, hesitating to use it, once more indicated the direction with his outstretched arm, and, to his delight, saw the man swerve as he wished.

Together the two leaped the fence surrounding the wood.

It is probably as unusual for a monarch as it doubtless is unpleasant to feel the cold ring of a revolver-muzzle pressed against his forehead. Nor did the words which accompanied the action bring any relief; for though the scout spoke very quietly, there was something in his voice which was as icy as the steel itself.

'Your Majesty is my prisoner,' he said in English.

'Eh? I not understand,' the captive gasped.

'I quite believe you,' Peterson said; 'but you must do your best to grasp the fact that you will be shot if you attempt to escape.'

'You insolent are, who you may be. I am the'—

'I am afraid that is a minor point, but I know quite well who you are. Do you give your parole, or shall I search you?'

'You will not such a thing dare.'

'Most decidedly I will,' said Peterson, and suited the action to the words.

'Now dismount, your Majesty.'

The man grumbled and obeyed, but let forth a savage oath when he saw the scout turn both horses adrift amongst the trees.

'Much too dangerous to keep them with us,' Peterson said. 'It's quite unnecessary to swear.

I'm the one to swear. You'll get your horse back sometime, for your chaps will find it presently, but my poor old black is lost for ever.'

'Now what?' the captive asked.

'Well, now your Majesty will have a good long tramp to the British'— He ceased suddenly.

Some one was shouting in Westrian somewhere amidst the trees.

At their feet a little stream flowed in its sunken channel through the wood. Though it was the first occasion in Peterson's life on which he had sat down with royalty, it is, I think, highly probable that he was quite unconscious of the honour.

A horseman leapt the water in which they cowered, and passed from view. In the distance there was a noise of two other horses smashing through the undergrowth. Then all grew silent again.

'Now, sir,' Peterson said, 'we'll be off. There'll be a fine hue and cry presently when your friends know you're missing.'

It was slow work, and work which must have been impossible for any one lacking that first essential attribute of the scout, the sense of direction. But Peterson, never hesitating a moment, led his captive diagonally away to the left through the murky darkness of the trees, until at last they came out into the open once more.

The fields over which they had galloped were now well away to their flank, and in consequence the two companions missed any straggling Westrians.

It may have been half-an-hour later when a rocket soared high into the sky behind them, and burst into a cloud of stars. Peterson turned to his companion: 'They know now in the Westrian camp of your Majesty's loss. We are travelling much too slowly; we must get on faster.'

'It is in these boots impossible.'

'I quite understand that those high thigh-boots are much more awkward than puttees for a pedestrian. But you must try.'

'It is not possible.'

'Even now you seem to fail to understand me. If your idea is to walk slowly and so get us overtaken by your men, I must warn you that that's a manoeuvre which won't pay. Your only chance of escaping from my unwelcome company is in the British camp. If your friends do catch up with us, they'll have to attend a royal funeral in the immediate future.'

The unfortunate captive said nothing, but Peterson smiled grimly as he noticed the pace quicken. It is perhaps kinder to draw a veil over the rest of the long tramp, which neither of the two men will ever forget, and not to follow that perspiring royalty stumbling and struggling to keep pace with the active scout.

But it is questionable which of them was the more thankful when at last a British challenge rang out through the night: 'Halt! Who comes there?'

'Friend,' Peterson answered.

'Advance one and give the countersign.'

Now, if there is one offence known to soldiers as being more heinous than another, it is that of giving the countersign to the enemy. It was, of course, fairly obvious that his exhausted captive could not make good his escape whilst Peterson obeyed the sentry's order, but it is rather characteristic of the scout that without a moment's hesitation he said, 'Go forward, sir, and say "Glasgow." Don't attempt any tricks. The sentry will be covering you from the front, and I shall be doing the same from the back.'

Peterson waited to hear the sentry's 'Pass friend. All's well.' Then he too advanced and passed within the British lines.

It was with considerable delight that Peterson seized the opportunity some ten minutes later to pound on Captain Tyans's tent at headquarters. The language raised by his violent onslaught sounded sleepy and anything but polite.

'Who the devil's that who?—'

'It's Peterson. I've just got back. Come out; I want you.'

'Blessed if I want you. Why don't you go to sleep?'

'I want you to wake the General.'

'Eh, wake the General? Why, what's the matter, eh? Better wait till the morning, hadn't you?'

'No, I can't. Come on, Tyans; wake up.'

'All right; I'm getting out of bed. Found out all he wanted to know, I do hope. Artie is so peevish when he's woke up suddenly.'

'Yes, I rather think I have. Tell him I've brought the Emperor of Westria with me.'

'What! My dear old chap, you've been scouting round a public-house, I should think. Well, let's have a look at him;' and Captain Tyans's head, covered in a Balaclava helmet, peered out of the tent. He was wide awake in

an instant, and ran with his bare feet through the mud to the General's tent.

There was much more of astonishment than of peevishness in Sir Arthur Rollic's voice when it bade Peterson and his captive enter the tent.

The General listened in silence to the scout's tale, staring hard at the prisoner, who had collapsed into a deck-chair. Then he said, 'Who's this you've brought with you, Peterson? I believe I heard you call him the Emperor of Westria.'

'Quite right, sir.'

'Quite wrong.'

'I beg your pardon, sir?'

'I say you're quite wrong. This is not the Emperor of Westria at all.'

'Not the Emperor!' Peterson stammered. 'But some one in the darkness certainly called him "your Majesty."'

'Yes, I dare say. But you know, Peterson, there are a good many majesties in Westria. This happens to be His Majesty the King of Estrenia.'

'Only the King of Estrenia? What a fool I must have been to make a mistake like that!' Peterson muttered savagely.

'Tut, man! don't look so glum. Surely he's a good enough catch. You've done magnificently, even if you haven't done what I told you to do.'

'You told me to find out who was in command at Rushton.'

'Yes, I know. That's just it; but you haven't done it. What you've done is to bring me the man who was going to command.'

Peterson said nothing.

The General was smiling as he continued, 'But I suppose I ought to approve of your action in obeying the spirit rather than the letter of my order, especially considering that Great Britain will now be able to insist on Estrenia dropping out of the fight. But, of course, the matter doesn't rest with me, because I shall have to mention the whole affair in despatches. And, Peterson, the Victoria Cross has been awarded for less than you have done this night.'

A REMARKABLE PEOPLE AT PANAMÁ.

By W. B. LORD.

THE San Blas Indians are a remarkable people. Living so close as they do to the works of the Panamá Canal, not one is to be found among the motley thousands labouring on the 'big ditch.' This is all the more noticeable when it is borne in mind that native labour is paid at a much higher rate than has ever been known in the annals of labour in any part of the West Indies or Central America. These people occupy a

narrow strip of territory along the shores of the Caribbean Sea, extending from Mandinga Bay to the Gulf of Uraba, and from the coast to the headwaters of the streams that flow into the Atlantic. Nominally they are subject to the Republic of Panamá; but, like the Indians in the tribal condition in the United States of America, they pay no taxes, and have their own form of government. They know that the white man

would come into their country only to exploit them, and they therefore keep him out.

It is not probable that they could or would offer much resistance to an armed force of a thousand men, but they are able to scare away prospectors and the like; and thus, by preventing white men from making claims on their land, they avoid any excuse for trouble. From early days they have been able to keep their women free from contamination by contact with white men, and to-day they will not permit a white man to sleep in their country if they can readily get him out of it by sunset. Yet these are not hostile Indians. They trade with the whites (practically all the cocoa-nuts of Panamá are from their groves), and sail their canoes down to Colón, where they sell and buy.

Loading down their frail, tiny, picturesque craft almost to the water's edge with native produce, they hoist their single huge sail to the flowing breeze, and glide gracefully out into the open sea. They sail for a distance of a hundred miles or more along the coast of Panamá, every now and again, on these hazardous voyages, breaking away from land into the broad expanse of the Caribbean Sea. With a fair wind they travel at a remarkably rapid speed, and seldom ship much water. The crew generally consists of two men and a boy, or three men. The canvas used in making the sail is spotlessly white, strongly reminding one of the white wings so familiar to British eyes at yachting resorts. To prevent the tiny vessel from capsizing, when the wind is unusually strong one of the occupants of the boat stands up on the weather side, holding on to the mere sapling which does duty for a mast. His weight is quite sufficient to keep the canoe in a fairly upright position. She is steered by means of an exceptionally long-bladed paddle with a short handle.

Upon reaching her destination in the harbour of Colón she is quickly surrounded by coloured folk of many nationalities, of all ages and sizes. These are always eager to possess themselves of the commodities offered for sale by the San Blas Indians. No coloured man or woman is happy in Colón unless he or she is engaged all day long chewing sugar-cane, and no child of colour is content unless he or she is pounding a cocoa-nut on the paving-stones preparatory to spending a good time.

The San Blas Indians are keen men of business. They give no change. Whatever coin is handed to them remains in their possession, providing it suffices to cover the price of the article wanted in exchange. Folk who do business with them regularly are aware of this peculiar trait, and take care never to give them a coin exceeding in value the article for which it is tendered. However, the Indians do not accept every coin that is offered to them, thus showing that they have some idea of relative values in the circular discs of metal, principally silver,

offered by people wishing to trade with them. Only unsuspecting foreigners, mostly British and American tourists, fall into the trap thus laid for the unwary, often paying a dollar for goods ordinarily sold for twenty cents or even less.

The Indians in the territory referred to number seven thousand two hundred and fifty-five, according to the census recently taken. In their tribal state they live in towns of well-built bamboo and thatched houses, raise vegetables and fruits, make articles of wicker-ware, and weave a cloth of coarse grass. These were the first Indians that the Europeans met in Panamá. Balboa got along very well with these people when the country was first discovered; but his brutal followers completely alienated their support, and this state of affairs has continued down to the present time. They object to negroes quite as strongly as they do to white folk.

The San Blas Indians are short in stature, well built, and keenly alert to anything that affects their interests. Needless to say, their womenfolk never accompany them on trading voyages to Colón or elsewhere. Those who have beheld the well-guarded ladies in their retirement declare that they scarcely appear to warrant the care that is taken of them, for they are far from possessing charms of the captivating order. About a year ago the President of the Republic of Panamá, Dr Pablo Arosemena, sought to pay these curious people a visit in his official capacity; but they refused to allow him or any of those with him to land. So his Excellency and suite had to 'beat it,' as the Americans say. The Indians allow their boys to leave home and live among the white men in their towns and villages until they are sixteen years of age, when they are compelled to rejoin the tribe. At various periods missionaries have attempted to evangelise in the San Blas territory, but few Indians would listen to them. Apparently they object to save their souls at the cost of their lands.

BY THE EDGE OF THE ROAD.

THERE'S a little gate by the edge of the road,
Which I used to open and hurry through;
For it led to a spot where a brooklet flowed,
And clusters of dark, sweet violets grew.
And there, at the mystical sunset hour,
On the mossy trunk of a fallen tree,
A maiden, fair as a pure, pale flower,
Would sit in the twilight and talk with me.

Oh, our love was sure, and our hearts beat high!
And the old, old story was scarcely told
When an angel smiled from life's radiant sky,
And called her home through the pearl and gold.
It may be the wind in the rustling grass,
Or a drift of leaves where the brooklet flowed;
But I often think that her light feet pass
To the little gate by the edge of the road.

E. MATHESON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THE case of France at the present time, her national and social state, her prospects, her task, and her preparation, are interesting and stimulating to all who admire a great people rising with a fine courage and an elastic spirit to the full value of its human resource and high civilisation at a time of threats and intimidation following upon a period of depression. Almost daily now we see mention made of some new feature of what is called 'the new France.' To those who merely read, this expression can convey little or nothing. That France is girding her loins has been evident for some time past. She answers menaces now with dignity and force in counter-preparations. She looks to the future with abounding hope and belief. She has recovered her nerve; she has got back her confidence; she has regained her buoyancy, and, with the restraint of a new dignity, has improved it. On the day on which I write I have talked to a German gentleman of some political consequence, possessing a close knowledge of affairs, and of an even and dispassionate judgment, and he said that of nothing in the world was he so much convinced as that there would be no European war in which the great Powers were involved which had commercial and territorial aggrandisement as its object; that, specifically, Germany would have no part in such a war, and could not afford it. A war like that, if brought about, would be at the decision of only one or two men, and those one or two in Germany dare not take the responsibility when, things being as they are, the risks of such a war would be so grave, the possibilities, even as concerning the victorious side, so appalling. No, said he, there would be war only when a question of national honour was concerned; then there might be a war. Yet a question of national honour, perhaps one that is fanciful, is nearly always made the pretext of a war which as its real cause may have the ambition of individuals or the greed of a people. Following upon this conversation, I walked along a street and saw in the window of a cosmopolitan bookseller two new volumes which were apposite to the occasion. One was in French, and its title was *The Inevitable War*, France and Germany being understood;

No. 128.—VOL. III.

[All Rights Reserved.]

and the other was in German, and was called *The German Task*, appearing to deal with the same idea from the German standpoint. There is to be no war with Germany associated unless some question of national honour, sudden and unexpected, should inflame the passions of the nation. Not merely a German citizen in a casual conversation, but the head of a nation, Ministers, ambassadors, some (not many) writers, say the same. Yet we hold our breath as we read that Germany is about to spend more on her army than has ever been spent on soldiery before, that she is about to expend over a hundred millions of pounds on military equipment of an improved character—forty-two millions to be spent on the present army, fifty millions to make the beginning of a great increase in the strength of the army, and ten millions as the first instalment of the annual fixed charges arising out of the increase. 'For,' says the Kaiser, 'as 1813 was a year of sacrifice, let 1913 be the same for every man, the times to-day being hardly less grave than they were a hundred years ago.' It is said that this increase is not to be as a bluff to foreign nations, but is intended as a well-considered and far-reaching expansion of German armaments by the employment of all the elements of the population liable to military service. And therefore the creators of this monster force of arms would make a 'fortune-tax' to pay for it, laying a great demand upon the rich, taxing fortunes, it is said, which amount to seven hundred and fifty millions, and compelling even the princes of Germany to make their contributions, immune though they have been from calls like this until now. Two hundred and thirty-four thousand men, it is estimated, are to be added to the army, and its numerical strength will then become eight hundred and sixty thousand. A million pounds are to be devoted to aircraft. This, we hear, is not bluff; it is not a menace; it does not mean an attempt to be master, a threat of attack. No; one hundred millions of pounds of German money will be spent in a spirit of pious resignation to the evil circumstances of the times, to defend the dear Fatherland when angry and vengeful foes should cause alarm and should impede it in the prosecution of its fair and peaceful commercial aims. So it is said.

APRIL 26, 1913.

Thus there should be no cause for any other people to take fearful notice, or to change its present way. But France must take notice, and does. She receives such news, which would have paralysed her senses once, with quiet and calm. The gaiety of Paris is not diminished; the governmental machinery on the Quai d'Orsay drives smoothly as before; the people of the cities and towns continue to be industrious, inventive, and to enjoy the graces of life; and the people of the country sing as they go to labour, sing all day, and sing on their nightly return, as peasants sing in France as nowhere else. She will make an adequate answer. Her people, united, strong, courageous, hopeful, will make sacrifices. Every man will serve three years in the army instead of two, and he accepts the new order with a happy smile. She is handicapped. She has only thirty-nine millions of people against the sixty-seven millions of Germany, and when nations are draining their resources to the uttermost a difference such as this is a serious thing. But the new France is not afraid. In the most recent times there have been two epochs in the realisation, the establishment, of this new France, two outstanding signs of the new spirit of confidence and unboasted strength. A little while since, as many times before, she was threatened, the screw was put upon her, an old oppression came forward once again. Morocco was the subject. This time she folded her arms, held herself erect, and looked the other party in the face. Such a thing had not happened for a very long time. The other party moved away; and later there were some revelations made of the strength of the army of France, not so much of its numbers, but of its skill, its efficiency, its effectiveness, and its splendid spirit. It was suddenly perceived—or remembered again after a long forgetfulness—that after all France is a military nation, that her people have the instinct of arms, that the rolling of the drum makes their hearts beat quick and fires their minds to warlike ardour, as is not the case to the same extent with some other nations of the Continent who are much interested in France. That was the first notable open demonstration of the spirit of the new France.

* * *

The second occurred but the other day. A new President of the Republic had to be elected, and France unerringly and without hesitation (not, of course, without keen and desirable opposition), peacefully and with great general satisfaction, chose the best man in France for the office, such a great, strong man, a big-hearted, keen, far-seeing Frenchman, such a real noble of the republic, as it has not frequently produced. Nothing was more significant than the universal acclamation of M. Raymond Poincaré as the best possible President, a strong man who would do well for France in a period of deep

anxiety and perhaps danger, not merely in France, but everywhere abroad. France, it was seen, had set her house in order. I happened to be in Paris when M. Poincaré was elected to the highest office, and I was in another part of the country on the day when he assumed the presidency; and one could not fail to note the quiet, complacent satisfaction of the people at what had occurred. There were no hysterics, no tumults, no extravagant enthusiasm, but a calm, deep contentment. The new France was being solidified and strengthened. M. Poincaré is a great personality. He is young enough, for he is only fifty-two. He is a man of Lorraine, with all the best qualities of his countrymen; he is of vigorous physique, frank and open in his manner, has a taste for humour, is a man of great energy and perseverance, and in his methods is very lucid and very precise, rejecting ambiguity and evasion, and bringing always into full relief the essential point. He is a statesman, and, if you will, a politician; but he is not at all a politician of the professional kind. He is a man of sober judgment and high ideals, not one to be carried away by any false enthusiasms. But he remembers always that as a boy he saw Bismarck and the Prussians come into the little town of Bar-le-Duc, where he was born. He is a deep and excellent thinker, and his national and patriotic philosophy is good for contemplation. 'You will love humanity,' he says to the people; 'but that will not make you forget that side of humanity, the choicest, most intimate, the dearest—the Fatherland. You will be men; but before all things you must be Frenchmen!' Then he says, 'A Government worthy of the name ought to endeavour to assimilate whatever is best in the national aspirations, and to co-ordinate the energy that is distributed over the country;' and he says also, 'The first duty of the French Government is to re-establish in the Chambers and in the country the idea of government itself.' When he was elected the word went round, 'There is something changed in France.' Indeed there is something changed. There is an active chief at the head of the Government. It must not be supposed that the President of the republic is a mere figurehead. In recent years presidents have acted as little more than that; but the time has come when France wants her leader to exert his power manfully, individually. She wishes to be led. In some ways the President is more powerful than a king. In France he may, if he will, prorogue the Chambers and suspend their sittings. He can by messages address both Chambers; he can make treaties; he can choose his Ministers; he can dissolve the Lower House; he is in supreme command of the army and navy; he can grant pardons. Of his own free-will and according to his own good judgment he can do many things that can be done by no other man in France, and the country desires

him to do them as he thinks fit. The republic is stronger now than it has been for a very long time past, and it is something of a coincidence that in two widely separated parts of the world, within a few weeks of each other, new Presidents of great republics should have been elected, and that in each case a striking advance in the betterment of the government should have been signified. Dr Woodrow Wilson at the White House at Washington and M. Raymond Poincaré at the Elysée in Paris make the republican system of government in general look a better thing than it has done in other periods of modern time.

* * *

People who go from Britain to Paris for a week-end can see nothing of 'the new France,' and they do not comprehend this quick and thorough change that is said to have taken place, such a transformation in the spirit of a whole nation as has rarely been effected in so short a space of time. The buoyancy of this wonderful people has never been so well exemplified before. The visitor to Paris sees it much the same as it was. Here, as everywhere else in France, he may find, or think he finds, the people a little more friendly to him and all Britons than they were from a dozen to twenty years ago, when there was no *entente cordiale* and diplomatic relations between the two countries were sometimes strained. They notice also that more Britons and more Americans visit Paris than ever before, and that is because Paris is still the best and lightest pleasure city in the world—when it is properly understood—the one where life is taken in the most careless way. The strain of modern times is felt in Paris as elsewhere; but the temperament and circumstances of the people enable them to resist it more easily than some others do. And then in these days, when people think less of crossing continents for holiday-making than their grandfathers did of crossing Channels, it is such a very little journey to Paris from London after all. It is not often realised that you are sooner in the French capital from London than you are in Edinburgh. However, while Paris inspires, generates, forces, governs, she does not in her outward appearance and ways suggest the new France any more than you can tell by a walk down Piccadilly what is the state of things in the British Empire. One needs to talk to the people of authority and the people of no authority, to penetrate to private places, to wander through the country, and above all, I would say, to read the newspapers thoroughly for a long period. The Briton abroad is too neglectful of the native journals. He will have his local paper sent on to him from home, and will read it with eagerness and satisfaction, though all the news in it is three days late. The native papers he rejects. He feels that he does not like their manner and style, and their point of view is not

his own, while their great subjects are nothing to him. But even though he may have some little difficulty with the language, the traveller in these days, if he would appreciate his own travelling properly and derive some profit from it, should make always a diligent study of the newspapers of the country, buy them every morning, read them carefully, and consider their features and their points. Very soon he may become almost as much attached to the native papers as to his own at home, and he will pick out from them one or two as his favourites, rejecting the others except for an occasional relief and change. By this reading he will come to understand more intimately, more thoroughly, the state of the life of the people, their present mood, their aspirations, their active forces, their impulses—their heart and soul and brain and body—in four days than he could in four months of talk and simple wandering. Whenever I go to a strange country the first thing that I do is to attach myself to its newspapers; and in France such great journals as *Le Matin* and *Le Temps*, *Le Journal* and *Le Gaulois*, old friends, are soon as much to me as those left behind in London. The insular Briton is too much disposed to the belief that, as with others of his native products, the British newspapers are the best in the world. For the most part they are very good; they are thorough; and for journalistic art and craftsmanship there are, to my mind, one or two—not more—which are superior to any others in any language. The utter and prejudiced believer in all things British looks upon the Paris Press as skimpy, thin, light, and careless, greatly lacking in dignity, with no journalistic skill displayed in its production. This is altogether wrong. The French methods and the French spirit in this matter are greatly different from our own; usually the leading journals are printed on paper of somewhat inferior quality to that most frequently used in Britain, and the average reader may never have come to understand how very much he is influenced, prejudiced, by the quality of the paper, the fabric that he holds in his hands. Wise journalists have said that it is better to print a poor article on good paper than a good article on bad paper—better, that is, from the financial standpoint—and certainly they are right. The French newspapers do not aim at giving full news about everything so much as do ours at home; they select more. Nor do they try to present it so impartially; they colour it more from the palettes of their editorial minds. They are a little more flamboyant, hotter in enthusiasm, more impulsive. But there is a spirit in French journalism and a character about it that are not common in our own country. Above all things there is character, strong individuality, in every newspaper; and I do not know more than two or three daily newspapers in London that have such strong individuality, which surely is an

attractive quality. No doubt the regular signing of all articles that are more than mere paragraphs of news has had everything to do with the production of this state of things. Give me *Le Matin* and *Le Temps* on a sunny morning when I am in the south of France, and there is little more that I shall need for my daily information of the world. And, again, the weekly and monthly periodicals of the review order are hardly inferior in France to what they are in London. *L'Opinion*, at fifty centimes, is as sound and excellent a weekly journal as I have read on Saturday mornings, and the *Revue des Deux Mondes* will compare with any of our collections of sober and well-considered reflections that are issued once a month. And what I would say upon this matter of the Press and the new France that has arisen is that the Press in its tone and in its contents exhibits the new spirit of the nation most faithfully and well. It is calmer than it was; it is more restrained; it is more generous and considerate; it is more dignified. It seems to indicate the strength of its people more than ever before.

* * *

But, as I have suggested, you must move widely through France, far from Paris and the Parisians, and must linger long in many places to see before you plainly and clearly this new France. In recent times I have done such wanderings, to large places and little ones in many parts, and not merely the pleasure-resorts where foreigners gather for winter lounging in the sunshine. When you do this and become accustomed to the ways of life, you come then to understand how everything is not better in one's own country than it is abroad. The occasional British traveller is apt to be very superficial in his judgments. Because the platforms of French railway stations are of low level, and he has to climb high to his carriage, and because the French locomotives are not polished like our own, he feels that travelling in France is much inferior to that in Britain; but yet he finds that his long journeys on the Nord, P.L.M., the Orleans, and the Midi railways are done most marvellously well and expeditiously; while for a station of comparatively small size there is nothing in Britain that is so neat and nice as that of Biarritz-Ville, which is constructed to some extent on the best American plan, with a little of French elegance added to it. Indeed,

in no form of locomotion have we been so quick to seize upon occasion and possibility as the French, who dart like a hawk upon a new idea that seems to have come on to us as a promise from the future. They were far advanced with their motor-cars while we were still insisting that a servant with a red flag should walk in front of any such terrible vehicle to warn the populace of its dangerous approach. To-day, while we still ponder about aeroplanes and airships, and become uneasy as we hear of those from foreign countries hovering about our shores, they are already nearly as much a matter of course in France as other ways and means of moving. You will see them darting over Paris; go out to Versailles, and with but a little exaggeration you might relate to your friends on returning that the air was full of them; and I have lately lingered at a little town in the south where they were so plentiful that one soon ceased to look upwards as the humming was heard in the sky, just as one does not turn the head at the twittering of a passing sparrow. There was an aerodrome of some size a few miles from where I rested, and we saw the aeroplanes that belong to it flying away above us and far out into the lost distance in the morning; and we would see them come back again at night, just like some giant birds returning to their nests. Until you witness such things as these you cannot realise what aviation already is. An odd aeroplane hovering beneath the British clouds seems like a brilliant experiment; a fleet of them shooting along the sky of France is like the gigantic force of a newly discovered world. Germany pins her faith to dirigible airships heavier than air, and we see to what efficiency she has brought them. France is for the aeroplane, and indeed she has mastered it. Nobody can yet say which is the more serviceable for the purposes of war, and it is those purposes which have stirred invention and improvement in this matter. One is like the great battleship, the Dreadnought; the other is as the fast and slippery little cruiser. Both together would be better than either alone; but for the present those who see these aeroplanes of France skimming like swallows through the air on high, rising upwards, darting down, feel that here there is something that is unmatchable. There are other aspects of this new France which may be considered at another time.

ATLANTIC GOLD.

CHAPTER XI.

HELMSDALE was standing in the doorway smoking a cigarette. Apart from a redness about the eyes he appeared to have completely recovered. He greeted his guest with his usual urbanity.

'You certainly brought us the fine weather, Arcus,' he said, proffering his case.

Arcus was about to decline, when it struck him that he had already smoked several of his host's cigarettes that morning.

'Finest weather we have had this year,' Helmsdale continued. 'I trust you got some rest after my unfortunate display last night. I cannot thank you in words, Arcus,' he added gravely. 'But there is gratitude here.' He touched his breast. 'And here also, I am sure.' He laid his hand on Florence's shoulder.

Arcus bowed stiffly. 'It was a mere matter of—of luck, my being at hand, Dr Helmsdale.'

'Luck!' repeated Helmsdale, with a queer smile, turning to his niece. 'You think it was luck, my dear!'

'It was Providence!' she replied warmly.

'H'm!' he murmured absently; 'Providence would seem to have a sense of humour.'

'Uncle Victor!' she began.

'Pardon me,' said Arcus, forcing himself to the point; 'but Miss Helmsdale and I have just seen a whale-boat approaching the island.'

'I was about to mention it,' Helmsdale returned. 'Hubert sighted her half-an-hour ago. No whales in tow. She is called the *Scot*. Her skipper has been ashore here.—You remember him, Florence?'

'You arranged some signals with him, didn't you?' Apparently she was watching Hubert in the lookout.

'So I did—so I did.'

Arcus did his best to speak naturally. 'Then I had better see to my modest packing. I have trespassed too long'—

Helmsdale appeared to rouse himself from a reverie. 'Surely you are not talking of leaving us!' he said. 'Although we did discuss your going by the first available means, I have been hoping that the urgency of your business might have evaporated, so to speak, and that you would favour us by waiting until the yacht came. Can't we persuade you?'

'It is very good of you, Dr Helmsdale,' the young man replied, beginning to wonder if he were a prisoner. 'But it is inevitable that I go. As for your kindness to me, I only wish I could repay you in some measure.' His voice softened. 'It is I who owe you my life.'

'If so, we are quits,' Helmsdale said easily. 'Once more, can't we persuade you?'

Florence slipped past her uncle into the house. Arcus hesitated.

'Well!' A smile flickered over the older man's lips.

'You know why'—

'Ah, yes, your friend in London! Very well, then, there's nothing for it but to signal the *Scot*.' Helmsdale called a question to Hubert, and received a reply. 'In five minutes or so it will be time to send up a rocket. Let us go down to the beach. We shan't see the *Scot* from here. Plenty of time for your packing. Besides, you must have lunch. I'll get the skipper to wait.'

They proceeded to the beach, Helmsdale relating a whaling yarn he had heard from the

skipper of the *Scot*, Arcus attempting an occasional remark, and feeling not a little foolish. Had not the scene in the laboratory included that too familiar American scrip he would have doubted the reality of his discovery, and would have explained Helmsdale's strange manner immediately afterwards as one of the natural effects of the accident.

From the beach they sighted the *Scot*. She was going at cruising speed—about eight knots. Within a few minutes she would be at her nearest to the point where they stood.

'Now, Hubert!' shouted Helmsdale.

Hubert applied the torch he had made ready, and with a harsh hiss and a thin trail of pale smoke the rocket soared upwards and into the haze.

Immediately after the detonation Arcus swung his gaze to the whaler. The crew, like pygmies, were waving their arms or caps.

'That's the skipper in the steering-box,' Helmsdale remarked. 'Nice place in a gale, Arcus.'

'Where will she stop?' the young man inquired.

'We shall see presently. Be patient.'

They waited. Helmsdale lit a fresh cigarette.

'It looks as if'—Arcus halted.

'It does,' Helmsdale sighed. 'I'm sorry, but we've done all we could. After all, we must not blame them. They want whales more than passengers. You must try to put up with us a little longer. Come, let us go and tell my niece the good news—from my point of view.'

Somewhat dazed by the double turn of events, Arcus turned from the retreating whaler and accompanied his host. He wished he could hate the man. For a defrauded public he cared nothing. Who does? But his heart was sick for Florence, his conscience sore on Anstruther's account. Meantime there was nothing for it but to accept the situation quietly and play up to his host to the best of his ability.

'Of course Hubert will continue to keep a bright lookout,' Helmsdale was saying; 'and on my part I promise that you shall have no more nightmares.'

'Thank you very much, doctor,' said Arcus. 'Nightmare is an excellent word for it,' he added with a laugh.

'It will serve for the present, eh?'

'Perfectly.'

Florence was coming to meet them, and Helmsdale slipped his hand through the other's arm.

'For her sake,' he said softly, 'let it serve.'

After lunch, which to all appearance was a cheerful enough meal, Florence found an opportunity to speak privately to her uncle. He was disappearing into the laboratory when she detained him.

'Uncle Victor, why did Hubert use only the one rocket?'

'One was the number I told him to use,' he replied, regarding her with faint amusement.

'Yes, dear. But your arrangement with the whale-boat's captain was two rockets if you wanted him to call.'

Helmsdale put his hand to his brow. 'How stupid of me, Florence! For Heaven's sake, don't tell Mr Arcus! It can do no good now. I remember—too late—that a single rocket was merely our message for "Good-luck" or "Good-hunting." You won't tell Mr Arcus, will you?'

'Is that quite fair? Well, I sha'n't tell him, dear, if you desire it so.'

'You would rather he had gone?'

This was too straight a question for Florence just then. She murmured something about 'Mr Arcus's friend in London,' and retired.

'Woman, woman!' said Helmsdale under his

breath as he shut himself in. 'But I think I have saved a scene as well as a rocket.'

The wind having died away, Arcus proposed a visit to the Other Island.

'I'm sorry, Stephen,' said Florence; 'but Hubert is using the boat. He is getting rid of some of the doctor's rubbish by dropping it overboard.'

Arcus tried not to speculate on the precise nature of the rubbish, and presently they set out for the Woman's Cliff, Florence slipping on her lover's gift as soon as they left the house.

'Am I very deceitful?' she asked him.

'It is I who am deceitful,' was his reply. And he added, 'I have a good mind, dearest, to tell him to-morrow.'

(To be continued on page 348.)

HORNED LIZARDS.

By Professor J. ARTHUR THOMSON.

AMONG terrestrial animals, the lizards stand easily first in the exhibition of quaint and bizarre forms. It seems as if Nature had, so to speak, let herself go among lizards in quips and cranks. The fairy called Evolution must surely have smiled when she waved her slowly moving wand that summoned forth a chameleon. Like a joke he and many another quaint lizard seems till we see them in their appropriate environment and at their daily work. We are thinking of forms like the little dragon, *Draco volans*, with its skin webbed between enormously extended ribs; or the Australian moloch, with its curiously hygroscopic skin, pimpled all over with sharp tubercles; or the frilled lizard which Saville Kent describes, that runs tottering about on its hind-legs like a baby just before it falls; or the basilisk, with erectile crests on its back; or our own British slow-worm, which has put on the guise of a snake, and is famous for the ease with which it can surrender its tail to save its life.

In the show of quaint lizards the chameleon must always be awarded the first prize; but many will agree with us in thinking that the horned lizards of Mexico, California, and Nevada come a good second. They have been known for a long time, but they have been made the subject of a recent monograph by Mr Harold C. Bryant, of the University of California. To this fine piece of work—one envies the author his subject—we are indebted for some new and interesting material. The creatures in question are often spoken of as 'horned toads,' the false classification being probably suggested by their squat shape, their sluggish ways, and their habit of catching insects on a sticky tongue. True lizards they undoubtedly are, and among the Iguanids; but they differ from all other members of the

order in their flat bodies covered with keeled, spiny scales, and in the circlet of horns upon the head. There are eighteen different species belonging to the genus *Phrynosoma*, and there is one other known, a unique creature from the deserts of the Gila and Colorado Rivers, which requires a genus (*Anota*) all to itself, and has the honour, indeed, of differing from every other living lacertilian in the closing up of a small opening on the top of the skull known as the supratemporal foramen. One needs, however, to know a good deal about skulls before one can appreciate the importance of this unique feature.

Let us turn to the significance of the horned lizard's peculiarities. First and foremost, what is the meaning of that circlet of sharp horns on the head, which recall (as if in miniature) the projecting horns of some of the extinct Dinosaurs of the Old Red Sandstone? The curious shape of head that results reminds one also of the quaint fruits of the water-chestnut which the peasants round Florence string into most decorative rosaries. But what are the horns for? They serve to ward off blows and bites, for the creature lowers its head and raises the scales of its back when it is on the defensive, and we can well believe that if an enemy bit the head of a *Phrynosoma* once, it would never do it again. The Indians say that if a snake swallows one whole, the indomitable lizard proceeds to work its way by a short cut from the stomach outwards—which for the aggressor must be an extremely disagreeable process, bringing repentance to the snake. Mr Bryant says that there is some foundation for this story, and it has its analogues at any rate in records of box-fishes biting their way out of sharks.

A second distinctive feature in the horned

lizards is their power of adaptive colour-change. They have the secret of the Gyges ring, and putting on the garment of invisibility is for them as easy as winking. 'Wherever its home,' says the monographer, 'the horned lizard resembles the colour of the substratum so closely that it is practically invisible except when in motion. Specimens from the white sand of the desert are very light in colour, those from the black lava belt are almost black, whereas those from the varicoloured mountain districts show red and even bluish markings. How quickly a change of environment would bring about a change in colour is not definitely known, although Coues states that the change takes place in from twenty-four to forty-eight hours.'

Given horns and scales and the mantle of invisibility, the horned lizards are safe, and we are not surprised to learn that most of the species are represented by large numbers of individuals. We can understand now why they have such a wide geographical range from Canada to southern Mexico, and from the Mississippi to the Pacific coast; why they rarely bite; why they can afford to take things easily, basking in the sun and moving with leisurely deliberation. When an enemy comes they 'play possum;' when they are thoroughly scared they seek refuge in a bush or burrow in the sand.

Even in their burrowing they are unlike most other creatures, for they work their way beneath the ground head-foremost. As Mr Bryant says, 'The chisel-shaped head is the principal tool, the legs being used almost solely for forcing the head forward. A wriggling motion of the head and body serves to drive the head beneath the sand and soon covers the body completely with earth. A little shake of the tail flings the dirt over that appendage, and the lizard becomes entirely hidden. The nostrils are kept either at the surface of the ground or near enough to the surface so that breathing is possible.' Sometimes the spines are left protruding above the ground like dry thorns.

Stranger even than the circlet of horns and the wonderfully perfect power of colour-change is the habit of 'shedding tears of blood.' It was for this that the Mexicans called the *Phrynosoma* the 'sacred toad;' it is to this that the boys of San Diego refer when they say they saw the creature 'spit blood.' As there are the best of physiological reasons why it can neither 'weep

blood' nor 'spit blood,' what is it that happens? The eyes are tightly shut, the eyelids swell to twice or thrice their normal size, and a fine jet of blood shoots out for several inches from beneath the upper eyelid. The whole phenomenon is startling and quite worthy of the strange creature. Some say that the hæmorrhage is associated with the excitement of the breeding season, but this lacks proof. So far as experiments go, they seem to indicate that the rush of blood is associated with shock and fright. The eyelids are rich in blood-vessels, and what happens is first a congestion and then probably the rupture of a blood-vessel. It may be compared to bleeding at the nose, but the point is that it has been regularised. One physiologist has suggested that the flooding of the head sinuses, the elevation of the blood pressure, and the jet of blood, while associated with fright and excitement, may also have a frightening effect deterrent to enemies.

The horned lizards are for the most part insectivorous, catching living ants, beetles, and flies on the end of the viscid tongue. 'Why the animal is never bothered by being stung internally by the ants it swallows alive seems hard to explain.' It is sensitive enough externally; can it be that it is immune internally? When insects become scarce, and the cold weather sets in, the horned lizards burrow into the ground and pass into the coma of hibernation. Dr Gadov makes the interesting note that if captive specimens are not allowed to hibernate, 'they will keep on feeding through the winter, but in that case are sure to die in the following spring.'

We may leave the horned lizards in their winter sleep, though without nearly exhausting their peculiarities. One more may be mentioned, which, like the hæmorrhage, well deserves further study. Mr Bryant has found that they are very amenable to what looks like hypnesia. When a specimen is rubbed on the top of the head and between the eyes, it turns its head down, closes its eyes, and passes into a stupor, in which it may remain for five or ten minutes. But the observer was not quite sure whether what happened was a faint, or a feint, or neither. It presents one of those unsolved problems with which every study in Natural History should begin and also end.

AT CHERRY-TREE FARM.

CHAPTER III.

It was perfect harvest weather in the morning, and Arnold woke rather late to the whir of the machine in the Long Field. Usually he was down at six or so. To-day he was not only late in waking, but slow in dressing. It was a

shock to him when he got out of bed to remember that it was his last day in this pleasant house. More and more of a shock indeed. He walked about the room, looking at the texts on the walls (the capitals all in gold), the photographs

(several of Peggy as child and little girl with long hair), the knicknacks—everything. The sun blazed in upon the bed and its white curtains. The window had diamond panes about a quarter obscured by red roses. It was open, of course, and the scent of the roses filled the room. He heard a clock strike on the landing outside—eight! The breakfast-hour was half-past seven, except on Sunday; and Willie's knuckles and shouting were wont to stir him long before then. It was 'Mr Man, mother says it's time you got up;' or 'Mr Man, are you moving?'—always something like that. But to-day, nothing; nothing except a sense of blankness and weight in the head.

He sat down on the bed and stared at the blue sky beyond the red roses of his window.

It was just about then that Peggy's little boy drew her attention to a young lady on the field-path to the house. They were by the stream, Peggy and Willie, on the spot where Mr Man was found in the grass. Peggy's eyes had red rims. She had promised her father not to see Arnold again, and was endeavouring to keep her promise. His wheatfield notwithstanding, Mr Harcourt was waiting indoors to see his guest of these nine weeks eat his last breakfast and—go. He didn't like his job, but meant to carry it through.

'Who's she, mother?' Willie desired to know. 'My! ain't she in a hurry!'

'She's a stranger, Willie,' said Peggy. 'I think you might run and speak to her. I don't think she can mean to be coming to see me. She may be coming to the wrong house. How scared she seems! Yes, run and ask her whom she wants. You see she's stopping.'

The meadow had been made into hay since Arnold's meander through it, and its aftermath was almost ready. The little boy galloped through the long grasses. These tickled his knees, and he paused twice to scratch them. 'Hi!' he shouted. But he needn't have shouted. Gertie had stopped for him, breathing fast and very flushed. She had dark, eager eyes, and black hair, and a boat-shaped straw hat braced by a dark-blue motor-veil. Peggy heard some words exchanged, and then, faster even than Willie, Gertie came towards her. She had a newspaper in her hand, but it told Peggy nothing—at first.

'Oh, good-morning!' she panted, within speaking distance. 'I understand this is Cherry-Tree Farm. Could you direct me to P. B.?' *This!*

She opened the paper and pointed to an advertisement on its first page.

Peggy's hand shook, but she accepted the paper and read the lines: 'The Gertie of Clapham who knows A. W. is invited to communicate with P. B., Cherry-Tree Farm, Silverstead, Surrey.'

She read the words as if they were new to her, and yet they were her own composing, and she had paid for twenty insertions of them out of her own pocket. Her father didn't know. She hoped—but this was her secret—that no one would ever know except herself and the newspaper people, and that there would be no response.

'It has been in several times,' Gertie continued heatedly, 'but I didn't know until last night. A friend showed it to me. It *must* be Mr Wise. Can you tell me anything? Mr Arnold Wise! He's not very tall, but—you do know, then?'

Peggy's smile gave her away. She continued to smile, and held out her hand. 'Are you Gertie, then?' she asked wistfully.

Gertie's eyes drew in a little. 'My name is Gertrude Lamont,' she replied. 'Yes. He's been missing since the 6th of June. But you are not P. B., are you?'

'Yes,' said Peggy, 'I am. He has lost his memory. Shall I tell you about it?'

'Is he *here*?' cried Gertie, all excitement and eagerness again. 'I feared he was dead. That was what terrified me all the time. He isn't dead?'

'Of course not. But he doesn't remember things. Perhaps—What did you say your name was? Mine is Mrs Brandon!'

'Oh!' said Gertie, 'thank you. I—didn't know. This is your little boy, then?'

'Mother!' put in the little boy himself, 'can't I go in now and see Mr Man?'

'Yes, dear, do,' said Peggy. 'Tell him—*Shall* we prepare him, Miss Lamont? Oh yes, Miss Lamont!' But Willie didn't wait for further injunctions. He ran as fast as he could.

Then Peggy and Gertie looked at each other, and Peggy noticed the dewiness in Gertie's dark eyes, and her beauty. This had struck Peggy almost immediately, but it made an increasing mark upon her.

'I don't know the circumstances, Miss Lamont,' she said very softly, 'but I ought to tell you that I have read your letter to him. It was all we could find to help us to restore him to his friends. It wasn't much good, because it bore no serviceable address. That was why I advertised. He has been here ever since the 7th of June.'

'With you?' asked Gertie suspiciously.

Peggy looked away, closed her eyes for a moment, and tried to smile. 'I live with my father, who farms Cherry-Tree,' she explained. 'We have taken every care of him.'

'Oh!' said Gertie. And then out shot her hand. 'How good of you!' she exclaimed. 'I think I must tell you everything, Mrs Brandon. Perhaps he will hate to see me again. I can't help it, if so. It has been all a horrible mistake. I thought my—my feelings had changed towards him, but they haven't. I found it out

when it was too late. And now—perhaps it would be better if I didn't see him. What can I do!

Peggy seemed to shiver. 'He has other friends and relations, no doubt,' she whispered. 'Have they not been anxious?'

'I don't know,' said Gertie. 'I—called twice at the office, and on Mrs Whiston at Surbiton, where he lodges. Yes, of course they are anxious. But'—she began to cry, and Peggy let her cry—'you don't understand,' she murmured piteously through her tears. 'You can't understand how I love him, and how ashamed I am of myself. I *must* see him. He may not forgive me, but I must ask him to.'

'I—see!' said Peggy.

'You don't. You can't possibly know how false and untrue to myself I have been. And it is all because of me! Is he in bed?'

'By no means,' said Peggy. And then she did a very pretty thing. She took Gertie's hand and patted it. And, still holding it, she led her towards the farm. She talked fast on the way, and rather at random; but the general drift of her words was so cheering that when they reached the garden gate in front of the house Gertie's eyes had a fine light in them again. No tears or dewiness now; a look of intense expectation instead.

The gate swung, and 'Mr Man' came forth as if to the signal.

Willie heralded his approach, with a '*Here they are!*' and a rush at his mother. Behind him was his grandfather, stiff in the jaw, but with curiosity peeping from his honest eyes.

Arnold took two steps, then stopped and stared—stared until Gertie was within a yard of him, and then burst out, 'Gertie!'

Over their close-pressed shoulders Peggy saw her father's eyebrows go up and down twice, and heard him clear his throat very harshly. After which he re-entered the house.

It was then Peggy's turn to remember her manners, and Willie's manners also.

'Come away, dear,' she whispered.

Willie wanted to pounce upon those other two and take his share in the huggings. He made a start for it, but was drawn back.

The gate clicked behind them.

'They're kissing each other again, mother,' said the little lad.

Peggy made no comment on that information, but, tightening her grip on the small fingers, marched him to the Long Field without a pause.

About an hour later the farmer found Peggy by the hedge, whence she was watching the bronzed wheat-ears fall in their hundreds.

'They're gone, my dear, the pair of them!' he said briskly, with a laugh as broad as his face. 'Got all his senses back at last. Never knew such a thing. Capper'll rub his hands when he hears. I'm to thank you, and so on. A stockbroker's clerk—that's what he is. Miss Lamont says they'll be glad to have him back at his office. She seems pretty sure of it. He's lucky if so. A nice girl, that sweetheart of his; and to think'—he covered Peggy's left shoulder with his tough palm—'to think that I thought he was making up to *you*, Peggy! He laughed when I reminded him about that.'

Peggy smiled bravely.

'Miss Lamont said she didn't wonder,' the farmer added. 'A jealous little puss, I could see, for all she pretended to be so smooth about it. Well, it's been a funny business, and we haven't seen the last of our "Mr Man," I hope. He bears me no malice for wanting to turn him loose. I like him better than I did last night, I can tell you.'

The farmer strode after the reaping-machine, and Peggy watched many thousands of wheat-ears fall ere she rose and returned to the farm.

THE END.

TREASURE IN WAITING.

THE word 'treasure'—meaning something very valuable, and preferably a few million pounds worth of gold bullion fastened up in strong chests; and, again, meaning specially such treasure as has been lost for centuries past and can only with difficulty be regained; and, once more, referring to such bullion at the bottom of the sea, perhaps in the holds of Spanish galleons—that word 'treasure' is one which strikes quickly into our imagination, and makes the most placid and phlegmatic young man of the City wonder if there is not something of the adventurer in him after all, despite his constant occupation by day in the routine of an office. Then let us consider treasure for a while. Where is the lost treasure?

How did it get there? And how can we get it out? These are important questions.

Many of us had our fancy tickled immensely a year or two back by the terms of one of the most fascinating financial prospectuses that has ever been issued. A company was being got together with a capital of two hundred thousand pounds, with the avowed object of making such a thorough and scientific effort to come by some of this lost treasure as had never been made before. The story is that seventeen Spanish galleons, men-of-war of two or three decks, laden with gold and silver and valuable merchandise brought from the West Indies, took refuge in Vigo Bay, where they were surprised and

attacked by the fleets commanded by Admiral Rooke. In order to prevent the victorious British and Dutch allies from gaining possession of the treasure, the galleons were sunk. Dr Iberti came to the conclusion that the total amount upon arrival at Vigo, as valued in 1702, was upwards of twenty-seven million pounds, out of which the treasure saved by the Spaniards, the booty taken by the victors, and the treasure recovered by the different concessionaires since then is altogether only worth three million pounds, so that something very good remains.

All this treasure was the accumulated value of three years' workings of the gold and silver mines of Spanish America, and the annual yield from these sources is computed to have been more than nine million pounds. Besides all this, there was a great quantity of costly merchandise, including pearls, emeralds, amethysts, amber, and precious woods from South American forests; and it was reckoned also that the wood of the sunken galleons, hardened by centuries of submersion, would yield a handsome profit on the labour of recovering it. Some critics have essayed to show that the sunken treasure, exceedingly valuable as all must admit it to be, is not quite worth all this. But at the lowest estimate its value must be many millions, perhaps at least twenty; and there was the word of Sir Roger Fenton that 'this Spanish flota was universally regarded to be the richest that ever came from the West Indies into Europe.' The unloading of the vessels had commenced some ten days before the engagement with the fleet of the allies; but, owing to the difficulty of transport over bridle-paths on pack-mules, only three thousand six hundred and fifty-three chests of plate or silver, worth about two millions, were landed when the enemy sailed in to the attack. I believe that the concession in the present case extends until 1915, and that there are strong hopes of some considerable success attending the treasure-seeking in Vigo Bay.

It is believed that there is one of those Spanish galleons at the bottom of the sea near Dollar Cove, at Mount's Bay in Cornwall; and there is a local tradition that many years ago the farmhands in the neighbourhood were in the way of going down to the shore at low-tide and picking up the dollars in buckets! A year or two back a serious effort was made to effect salvage, if there was any salvage to be done, and diving and sand-pumping were carried on at the spot where the galleon loaded with specie was supposed to have foundered. So far as is known no tangible good came of these efforts.

No community of persons is so constantly reminded of great treasure that lies on the bed of the ocean as are the members of Lloyd's in London reminded of the lost *Lutine* and the treasure that went down with her. The *Lutine* and Lloyd's are linked together in divers ways. A large and sombre-looking bell hangs from an iron

bracket at Lloyd's, and a good length of a ship's cable chain is attached to it. This is the bell of the lost *Lutine*, and it is rung—and causes a grave and anxious stillness whenever it is rung—when there is important news to hand concerning some ship that has been reported overdue, and whose fate, of course, is a matter of great concern to the underwriters of this famous exchange.

The *Lutine* was a sloop-of-war carrying thirty-two guns, and she came by her sudden and unhappy end in October of 1797. Just after midnight on the 9th, when running under a press of sail, she struck on the outer bank of the island of Vlieland. She sank at once, and all on board her perished except two men who managed to cling to floating spars and were ultimately picked up by a Dutch cutter. One of these, however, died immediately, and the other survived but a very short while. In the following year some fifty-five thousand pounds worth of treasure was fished up from the wreck, and since then a large number of attempts at salvage have been made, for the treasure that has been recovered is small in comparison with that which has not. In 1886 some three thousand coins, two cannon, three watches, and various other articles were obtained from the wreck.

Comparatively recently another and more determined attempt at salvage was decided upon. It was ascertained that the wreck is now so deeply buried in sand and mud that special means would have to be adopted if any good results were to attend the work; and accordingly an oval steel tube was made, nearly a hundred feet long and wide enough to allow a man to walk erect down the centre. There was a metal chamber provided with windows and doors at one end, and at the other there was a medley of giant hooks and tackle of various kinds. One end of the tube was to be clamped to the side of a steamship or barge, and the other, by means of water-ballast tanks, was to be sunk until it touched the bottom. Then, by using compressed air, all the water would be forced from the tube and also from the chamber at the bottom of it, which would be flush on the bed of the sea. Divers would walk down the stairway in the centre of the tube until they reached the submerged chamber, where they would assume their diving-costumes, and then, opening a series of watertight doors, would step straight out into the water. Engineers would be stationed in the chamber; and, following the instructions of the divers, who would communicate with them by means of portable telephones, they would operate the mechanism of two powerful suction-pumps or dredgers fitted to the sides of the tube. The idea was entertained that these dredgers would suck away the sand around the sides of the heavy chamber until it would gradually sink by its own weight right down on to the deck of the wrecked ship. The divers would

then make their way from the chamber to the deck of the ship, and from there to the hold; after which success nothing would be simpler than to convey the treasure of the *Lutine* to the ship above by easy and comfortable stages with something of the regularity and method of unloading a big cargo-boat in the East India Docks. Such is one of the most ingenious and best-organised schemes for the recovery of treasure ever planned, and in good season it will be carried to execution.

And then there is Tobermory. All have heard of the treasure that lies at the bottom of the sea at the north-west corner of Mull, one of the fairest parts of the western coast of Scotland. There is some substantial fact and much fiction in the stories that have been told about the treasure-ship of the Spanish Armada that was sunk in this place, and both are attractive. It is only comparatively recently that we learned from the Spanish Admiralty the proper name and particulars of the ship that was blown up and sunk at Tobermory. She was the *Duque di Florenzia* (Duke of Florence), and was one of the largest and best-equipped vessels in the whole Armada, being the senior ship of the Tuscan squadron. She was of nine hundred and forty-one tons burden, built of African oak, was armed with fifty-two guns of various calibre, manned by three hundred and eighty-six sailors and one hundred marines, and was commanded by Captain Pereira. She was a treasure-ship, and carried bullion to very high value; but it begins to appear unlikely that she had on board the thirty million pieces, equal to three million pounds sterling in British money, with which she has generally been credited. Some have lately been arguing that she was not a treasure-ship at all, that there has been some confusion in names, and that that of the Tobermory ship is really *San Juan Bautista*.

During the latter part of the seventeenth century many attempts at salvage were made, and a few guns and coins were brought up; while it is said that in 1688 a Swedish engineer, bringing a diving-bell to his assistance, did actually recover a great deal of treasure. Some fifty or more years afterwards the diving-bell was employed again, and a very magnificent gun, the work of Benvenuto Cellini, was recovered, with other things more or less valuable. This and others are now at Inveraray. In the last few years some very thoroughly organised efforts have been made to recover the treasure, all the most up-to-date mechanical and electrical salvage appliances—submarine tubes, diving-bells, dredging apparatus, and all the rest—having been brought to the assistance of the searchers. The first of these thorough efforts was carried out by Captain Burns, of Glasgow; but though many things were brought up from the wreck—which is really still there—the treasure in bulk was not gained. Sceptics began to say that the hunters

of the seventeenth century must have got most of it, but others are more sanguine. During the summer of 1910 eight acres of the mud at the bottom of the sea were probed in the search for the chests of gold; and, though they were not found, it is said that the sensitive electrical apparatus which was employed indicated that masses of gold and silver were still hidden beneath the waters. Later endeavours have not disclosed the treasure.

All this was treasure that went to its hiding-place in the time of Elizabeth; and, if that seems far enough back, what of the treasure that was lost (and, as some say, may still be recovered) in the last days of King John at the beginning of the thirteenth century? At the extremity of his career and his long-drawn-out conflict with the barons, John, with his army and wagons—these latter laden with the plunder of half a kingdom and the costly treasure of a king—was making his way northward through Lincolnshire; and, coming to Cross Keys, which was then on the border of the Wash, he attempted to cross the sands to the other side, but was caught by the tide, and horses, wagons, and baggage were swallowed up by the quicksands. The king, in the rear, saw it happen from the Lincolnshire coast, and it is said that he himself had a narrow escape that day.

Now it is quite certain that there went down at this time not only vast treasure in coin, but the most glorious riches in the way of the spoils that John had gathered from the churches and abbeys he had looted everywhere. There were the riches of Croyland Abbey among them; and, valuable as these things were at that time—as John knew so well—how much more so, magnificent relics of the thirteenth century, would they be to-day! What a scene of strife and excitement would there be at Christie's auction-rooms could but one of them be put up for sale there in these times! And it is considered probable, also, that some pieces of the ancient regalia of England were lost with all the rest.

Now, salvage of all this, if it were still in the quicksands of the Wash, would seem but a poor thought; but the truth is that what was the Wash in those days is now good, solid Lincolnshire, all that part having long since been reclaimed by diking and draining. The line of the old passage from Cross Keys to Long Sutton is now as firm as a street in London or Edinburgh, and the treasure is in the ground below. It is said that the king's wagon-train stretched at least two miles; and it has been suggested that if a trench some ten yards deep were cut transversely across this line it must surely be struck.

There, then, is a great treasure waiting for recovery; and in this case there is no diving under water to be done, but simply digging in the light of day. Railway trains constantly

run across from Cross Keys to Long Sutton on the exact route that John's baggage-train took; but how many of the passengers know or think of that awful tragedy of history that took place there, the evidence of which is surely in the ground below them?

There is plenty more treasure besides all this. There is much of it in South Africa. Lobengula's millions! That is how they speak of the treasure which was hidden and buried by the famous king of the Matabele. There were only five men who knew where the treasure was deposited, and of those five there is only one still living, this being John Jacobs, a native minister who was at one time private secretary to the king. This man says that the treasure consists of two million eight hundred thousand pounds in gold coin, thirty-six bars of raw gold, ten wagon-loads of ivory, and four hundred diamonds. Some two or three years ago Jacobs was taken with an expedition that set out in search of the place, and trekked along the Zambesi to Sesheke, and then to Lealui, the capital of the King of Barotseland, meeting with much hardship and adventure all the way. From there they tried to get to the head of the Kori River, which was understood to be the wanted place; but they were misdirected by natives, and, getting a long way out of their course and suffering from lack of food and desertions, had to give up and turn back.

Then there are also 'Kruger's millions,' which are understood to be lying at the bottom of the sea in the wreck of a ship called the *Dorothea* off Cape Vidal. People whose authority in the matter has to be respected, however, declare that though the gold is there it was never Kruger's, and that indeed he knew nothing of its being on this ship. The alternative and probably true story is that certain officials connected with the Government of the Transvaal, seeing the way in which things were going shortly before the outbreak of the war, issued authority to several individuals permitting them to engage in illicit gold-buying. Having authority to buy gold from mine-managers at their own price with a view to getting it out of the country, they looked to make a good profit on it between the purchase-price and what they would get for it in Europe. It is confidently believed that as the result of this arrangement four hundred and fifty thousand pounds worth of gold in bars was placed on the sailing-ship *Ernestine* at Delagoa Bay, the name of the ship being then changed to *Dorothea*. This vessel had been condemned as unseaworthy on account of some acid having been spilt in her lower hold; but she was put to rights, and the

twelve big boxes of gold bars were placed in the hold abaft the foremast, cemented over, and two hundred tons of sand-ballast were tumbled into the ship on top of them.

Then the *Dorothea* set sail, and it was given out that she was bound for Monte Video—which, of course, she was not; and a few days afterwards she was wrecked. It is believed that, despite the failure of some very thorough expeditions, this treasure will yet be secured; and it is said that, on one of the earliest expeditions that set out in quest of it, a diver named Kramer brought up from the wreck three pieces of cement which plainly showed the impression of the cases, and also about one and a quarter ounces of gold from a bar which was protruding.

Captain Gardiner, who has been commanding the exploring-ship *Alfred Nobel*, and making a great speciality of hunting for sunken treasure—being certain, as he says, that 'there is money in this class of adventure'—has expressed himself with much confidence about getting the gold out of the wrecked *Dorothea*; and he reminds us also of more treasure of the deep—that which is in the wreck of H.M.S. *Grosvener*, a transport which was lost coming home from India at the time of the Mutiny. She had on board a cargo, including precious stones, gold and silver bars, and tin, valued at more than one million seven hundred thousand pounds. The wreck took place off the Pondoland coast in from five and a half to six fathoms of water, and is completely covered with sand. Recently it was announced that a salvage company was making preparations to recover treasure to the value of more than four million pounds sterling in sunken ships which are not only known to exist but have been located, and with this scheme Captain Gardiner is associated. 'After exhaustive search in the archives of Cape Colony,' he said, 'I selected one hundred and thirty-seven of the more valuable and accessible wrecks, and during the last seven years, at an expenditure of more than four thousand pounds, have succeeded in discovering no fewer than thirty-two of them.'

And beyond all this there is much more buried and sunken treasure—far more. There is, for instance, the famous treasure of Cuzco, the story of which was given last year in an article in these pages entitled 'The Lost Treasure of the Incas.' Then there is Lake Guatavita, into which during unknown ages offerings were cast by the Indians, among whom gold abounded. And so on, if one chose, and had the space for the telling of many other examples of mineral riches taken from the earth, and held, and then let slip again by intention or not, and so lost; but some of them may yet be found at last.

THE MONTH: SCIENCE AND ARTS.

AN INGENUOUS FREEZING-MACHINE.

ONE of the most noticeable features of contemporary inventive ingenuity is the search for a small, compact, and efficient machine for the production of ice-cream in the home. This delectable dainty would be consumed more extensively if its preparation were not so expensive and arduous, requiring several pounds of ice and thirty minutes or more of hard drudgery. Recently a machine has been placed on the market which eliminates these drawbacks, and enables ice-cream to be made on the spot with marvellous facility and expedition. The freezer comprises a metal drum revolving in a neatly constructed wooden box. The interior of the box is provided with a porcelain container to hold the mixture to be frozen. The drum is the receptacle for the ice and salt, or a chemical freezing-mixture which can be used effectively when ice is unobtainable. By means of a stopper access is obtained to the interior of the drum, into which the freezing-mixture is emptied through a small metal funnel. The aperture is then closed by means of the stopper, and the freezer is ready for action. About a quart of cream mixture is poured into the receptacle, and the lid of the box closed for thirty seconds. After this interval a film of frozen cream is formed on the face of the drum. The handle is turned slowly, and as the drum revolves on its pivot the frozen cream is cut off by a conveniently placed scraper in such a manner that a continuous flow of ice-cream is projected from the machine. After the first thirty seconds the flow becomes continuous, and it is only necessary to pour fresh mixture into the box according to the quantity of the product required, or until the freezing-charge is exhausted, when of course the drum can be recharged in a minute or two. Four pounds of ice will last nearly an hour, and during that time a steady stream of ice-cream issues from the machine. There is little or no friction, as the drum is delicately pivoted and revolves in a liquid body formed by the milk and cream mixture to be converted into ice-cream; consequently the effort of turning the handle is so very slight that it can be effected by one finger. Under these conditions ice-cream making, instead of being a laborious and disagreeable task, becomes a congenial one, capable of performance by a lady or a child. When it is required to charge the machine some time before using the ice-cream, as in the case of a picnic or a boating-party, the drum may be filled with ice before starting, and the salt added at the last moment, the ice being thus preserved for some hours before being actually called upon for service. Only four pounds of ice are required for a full charge, while half that quantity suffices to make from one to two quarts

of ice-cream. Of the many domestic ice-cream machines which have been devised during the past few years, most of which are of American origin, this British apparatus certainly represents the greatest advance, enabling every home to enjoy a favourite luxury at an infinitesimal cost.

THE SAFE WINDOW-CATCH.

Recently the problem of locking the window and door safely has been frequently under discussion. The ordinary type of window-catch is an obsolete device offering no security whatever, seeing that it can be opened from the outside by means of a knife, while in very stormy weather it does not prevent disconcerting rattling. It is somewhat surprising that the rack-bolt has not been more widely adopted, as it cannot possibly be moved from the outside, for the knob cannot be displaced without smashing the glass—a method too risky for the predatory inclined. The device is very simple both in design and operation, and there is nothing to get out of order. A small plate carrying a knob makes a half-turn, and the lower side of this knob, which enters into the wood, is provided with teeth. The bolt itself is mortised into the sash, and at the inner end is toothed to mesh with the teeth on the knob, so that it moves to and fro with a half-turn of the knob. Thus the window is held very tightly, and no manipulation with a knife-blade can move it; it also prevents the window from rattling, and holds it up when improperly balanced by the sash-weight or when opened for ventilation. It is a very neat attachment, occupying no more space than the ordinary sash-fastener, and is applicable to all types of windows with equal facility. Moreover it is more secure as a door-fastener than the ordinary bolt, for, the latter being screwed to the face of the wood, the door can be forced open by starting the screws under leverage; but the rack-bolt, being mortised into the door-stile, cannot be burst in this way. This type of bolt has been adopted extensively by white occupants in foreign countries, and has proved its efficiency. Very conclusively, so that it is somewhat surprising that old-fashioned methods still prevail at home.

AN ELECTRIC WAITER.

A device which should receive widespread attention, and save time, trouble, and dissatisfaction, has been perfected by a New Zealand inventor. This is an electric waiter for hotels and restaurants, the object being to eliminate delay and to bring the customer into direct communication with the kitchen, instead of his having to transmit his order through the waiter in the usual manner. On the table is the menu mounted in a wooden frame, and opposite each item of the bill of fare is an electric button. The customer

selects his requirements, and then depresses the buttons indicating the dishes he chooses. In the kitchen is the indicator, or recorder, where the number of the table and the articles ordered are recorded. When the order is completed a bell is rung automatically to draw the attention of the *chef* and his assistants. The kitchen machine also issues a duplicate of the order, as well as the customer's table number, together with the amount which the waiter has to collect. Thus it is impossible for an error to arise, as the printed check offers irrefutable testimony that the customer has received what he ordered. Further, the bill cannot be tampered with, as the kitchen machine retains a counterfoil of the check upon an endless tape, and this record is compared with the waiter's checks at the end of the day. Thus complete control is maintained both upon the money received and the goods sent to the dining-room; better service is also secured, as the system is proof against mistakes. And the waiter cannot be blamed, as is now the case, for misunderstanding the order. Moreover, there is a considerable saving of time, delays during the busiest hours of a restaurant being considerable even with almost perfect human service. The writer is informed that the invention has been adopted in New Zealand restaurants, and has apparently given complete satisfaction.

A SEALING-WAX HEATER.

In commercial houses where sealing-wax has to be employed extensively for packing purposes, the arrangements for the handling of the wax are generally very primitive, and the risk of fire from the upsetting of the contents, or ignition of the wax or of articles coming into contact with the flame, is by no means to be despised. A British firm has introduced a heater wherein the wax is melted by electricity. The cone-shaped receptacle is mounted upon a vertical support attached to a base-plate. The vessel may be adjusted to any desired height, while by means of a trigger the supply of wax can be controlled to a nicety. The apparatus is compact and strongly made, the heater being of polished copper, with brass fittings. An ordinary plug and length of flex connected to a lamp-holder or wall-plug of the lighting circuit is all that is required to bring the device into action. Being light and portable, the heater may be moved from point to point as desired.

THE RADIO-ACTIVITY OF THE BATH WATERS.

Taking the waters at Bath has assumed a new and far-reaching significance since the radio-active qualities of the waters were discovered. Recently there was a meeting of doctors in the city, and the properties of the waters were discussed at length. According to Sir William Ramsay, the gases escaping from the waters are now bottled up under pressure in steel cylinders, as with oxygen, and are used for spraying treat-

ment. According to this distinguished scientist, the waters may be taken by one of three methods. If taken inwardly the doses should be small and frequent. So far as the baths are concerned, in order to secure the full effects the patient should be made negative, as by this means the particles given off by the radium may be absorbed through the skin. If spraying or breathing treatment is adopted the patient likewise should be rendered negative, so that the radium particles may be decomposed. By either of these methods the full curative benefits accruing from the treatment may be obtained.

ELECTRIC FARMING.

Scarcely has the petrol-motor established itself upon the farm for the completion of any and every operation wherein power is possible than it is threatened by a formidable rival—electricity. In Victoria, Australia, a complete installation has been laid down for carrying out every possible undertaking of mechanical operation by electricity over an area of twenty-five hundred acres. Electrically driven pumps keep the irrigation ditches charged with water; while ploughing, harrowing, drilling, sowing, and reaping are all carried out by the one agency. Accumulator-driven locomotives have been acquired for the haulage of the crops from the fields to the main yard, whence they are despatched to market or stacked. In the United States electric farming is making great strides, as it is conceded to be more economical than, and superior to, the use of the petrol-motor. A vigorous educational campaign also has been waged in Ontario with the object of convincing the farmers of the advantages and possibilities of this method of conducting agricultural operations. Two portable threshing-outfits were taken on tour, and on the various farms corn-cutting, threshing, and other work were completed by electricity side by side with the methods in vogue, so that reliable comparative data concerning cost, time, and simplicity of control were afforded. Similar methods have been brought into operation both in these islands and in Germany; although so far as this country is concerned the applications are neither large nor comprehensive, inasmuch as electricity has not yet achieved such a vogue as in other countries. The dearth of manual labour for agricultural pursuits will cause vast developments in electrical operation, as it offers the farmer a means of easing and cheapening, as well as expediting, his work.

A TELEPHONE TIME-SAVER.

Inventions in connection with the telephone appear to be endless. While many so-called improvements fail to justify their claims, here and there is a device which certainly constitutes a time-saver. The amount of time lost during the day in an office where the telephone is in extensive use by 'holding-on a minute' is con-

siderable. The latest device has been contrived to eliminate this exasperating incident in telephonic communication. There is a sound-magnifying trumpet of flat shape, behind which is a small attachment intended to support the telephone receiver. When it becomes necessary to hold the line, either when calling up or replying, instead of the person standing with the receiver glued to his ear, he places the receiver upon the time-saver, bringing the earpiece into position with the sound-magnifier. He is then at liberty to resume his duties until such time as the person required at the opposite end attends his instrument. This is notified by the speech transmitted being magnified by the time-saving device, so as to be perfectly audible at a distance. The receiver may then either be withdrawn and held to the ear in the usual way, or left in connection with the magnifier, hearing being quite as simple and easy as under normal conditions. Another advantage of the invention is that the user's two hands are left free to carry out any other requisite task, such as the turning up of documents, making references, writing down messages or instructions from dictation, and so on.

WATER-TURBINE PLANT.

All over the world the question of turning water-power to commercial advantage is occupying the attention of engineers. In such countries as Sweden, Italy, and Switzerland, where fuels are a negligible quantity, the profitable exploitation of what the French term *l'huile blanche* is exercising a far-reaching effect upon economics and commerce. The importance of the subject may be realised more convincingly, perhaps, from the fact that nearly every nation is appointing hydro-electro commissions to investigate and conserve its water-power resources. This development has imparted a striking impetus to the water-turbine manufacturing industry. Already many huge plants have been laid down, the most important and best known probably being those at Niagara and in Sweden. The subject is of fascinating interest to engineers; but unfortunately, the industry being in its infancy, text-books bearing on the matter are few in number, expensive, and for the most part unsuited to work on the spot. For this reason *Water-Turbine Plant*, by Jens Orten-Böving, M.I.M.E. (Raithby, Lawrence, & Co., Ltd., Strand, W.C.), the eminent engineer in this particular branch, is peculiarly useful. The man in the field will find it an indispensable adjunct to his kit, inasmuch as it is highly practical, giving just that information of a mechanical character which is required to assist in the determination of the best type of plant, and how it can be laid down in the most efficient and economical manner. It is not an elaborate theoretical and mathematical treatise upon the turbine, but it discusses sufficiently the salient

features of the machine, both reaction and impulse, and the innumerable accessories requisite for a complete plant. It contains just that essential material, formulae, and theory necessary to facilitate the decision as to the best type of plant. The reference tables will be found invaluable, since they bear on every aspect of the problem; while pipe-lines and their lay-out are adequately discussed. The volume is elaborately illustrated, embracing every detail connected with the mechanical element of the subject, and containing also illustrations of many of the largest plants which have been laid down, and in which the Orten-Böving products have played very conspicuous and successful parts.

A NEW VARIABLE SPEED-GEAR.

An invention of which great hopes are entertained has been perfected by two young mechanical engineers of Gisborne, New Zealand. This is a variable speed-gear designed for application to all classes of machinery, so as to secure greater flexibility. It is as applicable to reverse as to forward running. The inventors some time ago devised a similar variable gear for cycles, the success of which, upon its commercial exploitation, prompted a continuance of their studies and experiments with a view to the solution of the bigger problem. The simplicity of the idea is its outstanding feature, together with its wide range of application. It is entirely free from complication, and this fact renders possible substantial construction of the component parts, so that liability to failure is reduced very materially. At the moment its application is being restricted to automobiles, to supersede the present unsatisfactory gear-changing system and box. It is positive in its action, and instantaneous reversal is possible. Subsequently the invention will be applied to lathes, looms, stationary machinery, and the Diesel oil-engine, which at the moment is in urgent need of a reliable, efficient, smooth-working, and simple gear. The full particulars concerning the invention have not yet been disclosed, although arrangements have been completed for its commercial development on a comprehensive scale.

WILD ANIMALS IN CAPTIVITY.

The study of the habits of wild animals in captivity and in their native haunts has been pursued with considerable success by some modern naturalists and by not a few amateurs; and many of such students and observers have had the gift of writing intelligently and attractively about them. This close personal study of wild animals has led to innumerable books, in which habits and life-histories are narrated. To name only a few observers who have written incidentally or wholly about animals, we have had H. Fabre, H. C. McCook, Richard Jefferies, J. A. Owen, Richard Kearton, Ernest Thompson Seton

(Seton-Thompson), C. G. D. Roberts, and Jack London. These men, and many others, have with infinite trouble and patience extended our knowledge of the animals in the world around us. To see wild animals in captivity is better than never to see them at all; although if they had their freedom the tables would be swiftly turned on the student, as liberty for them would mean an empty zoo for the promoters. The majority of people, including the young folks, can see wild animals only in captivity; hence the interest of zoological gardens. There are eight zoological gardens in England, including the famous one in Regent's Park, London, which is to be rendered still more attractive by the Mappin bequest. Germany has twenty collections of animals, the most famous being that of C. Hagenbeck at Stellingen, near Hamburg, the chief feature of which is a panorama from the central point of which large numbers of wild animals are visible without intervening bars, with a background of artificial rock-work. A zoological garden is in process of formation at Edinburgh, on a fine site on the south slope of Corstorphine Hill. The London society has promised to lend a number of animals on its inauguration, and two lion cubs will be presented from the Dublin Zoo. The number of gardens in North America is fifty-seven, including the famous Bronx Park, New York (the richest and most enterprising in the world), that at Washington, and Lincoln Park, Chicago. The Government garden in Calcutta is the most famous and best equipped in India. The Government zoological garden at Giza, Cairo, is world-famous. The director, Captain S. S. Flower, has compiled a list of zoological gardens of the world—private, municipal, and national—and the number this year amounted to one hundred and sixty-eight.

ACROSS SOUTH AMERICA BY RAIL.

Since the opening of the tunnel through the Andes on 4th April 1910, and the linking up of the Argentine and Chilean railway systems, it has been possible to cross South America, from Buenos Aires to Valparaiso, in a day and a half, at a cost of slightly over twelve pounds for first-class fare, with bed, and eight pounds for second class. This compares favourably with the long and often stormy passage by steamer round Cape Horn. From Valparaiso it may in the future be possible to get a quick route to Australia and New Zealand. On the level and fertile plains of the province of Buenos Aires the line has an absolutely straight run of one hundred and seventy-five miles between Vedia and Mackenna. There is a gradual rise to the Cordillera, the land being fertile, and watered by mountain streams. Around Mendoza the land is under vines, and from this district and that of San Juan some eight hundred thousand barrels of wine are annually produced. Phthisis is practically

unknown in this healthy and bracing region. On leaving Mendoza the line at first passes over cultivated ground, and at Cachenta, six hundred and seventy-four miles from Buenos Aires, reaches a point four thousand and eighty-five feet above sea-level. Close to this station are valuable thermal and sulphur springs. Inca station, ninety miles from Mendoza, and eight thousand nine hundred and twenty-four feet above sea-level, has also valuable hot mineral waters, containing salts of iron, sulphur, and chloride of soda, which are coming into favour. Near Inca is the famous natural rock bridge over the river Cuevas. After leaving Puente del Inca, Aconcagua is seen, rising twenty-three thousand three hundred and ninety-three feet above sea-level. What is known as the Christ of the Andes is a statue erected in 1904 on the borders of Chile and Argentina to commemorate the peace established between the two countries. The Transandine tunnel, which takes about ten minutes to negotiate, is one mile one thousand seven hundred and four yards long, of which over a mile is in Argentine territory. Fine views are obtained as the train descends the Chilean side, and Valparaiso is reached through changing scenery, the valleys and mountains being luxuriant by reason of the moist winds from the Pacific. More than half of a new trans-continental line has been completed, which will extend across south Argentina from Port San Antonio to Puerto Montt in Chile.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

TO AN ALMOND-TREE ON THE JANICULUM.

I SAW an almond-tree to-day,
A blaze of flowers against the blue
Of infinite infinity,
In places where the sky looked through
Its branches. Such a lovely thing!
I felt as if I ought to sing.

I felt as if I ought to sing,
Yet seemed it any song of mine
Might here profane some sacred thing—
Some half-seen element divine
That to those boughs like incense clung,
As if I sang where God had sung.

ROME, 1912.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

THE VINDICATION OF PATON.

By J. MORTON LEWIS.

CHAPTER I.

THE court was empty; shadows filled the courtroom and the corridors; the long train of witnesses had left. The Judge retired to unrobe.

Among the shadows there stood two men. They were both young, but on the face of one were graven the lines which tell of trouble; dark rings marked his eyes, and darker lights shone in them. He was as a man who had plumbed the depths, and returned seared.

Holding out his hand, he said, 'I had better be going back. I must thank you, Mainwaring, for what you did to-day. But for your defence I should by now have been condemned to death'—he shuddered—'condemned for a crime I never committed. You believe in my innocence, don't you?'

The grip on his hand tightened. 'Believe in it as thoroughly as I do in my own, or I could never have saved you. I know you are innocent.'

'Thank you!' The man smiled wanly. 'I may as well say good-bye. We may not meet again for several years.'

'Where are you going?'

'God knows—somewhere where I can make a fresh start, where my name won't stink so much as it does here. Heavens, man! nearly everybody looks upon me as guilty. I heard it in the court to-day. Your name is made, because of your speech on my behalf. They didn't say so in as many words, but they implied it—I am guilty.'

'Nonsense!' A softness crept into Mainwaring's tones as he tried to hide the truth from him, to deny it, so that he might not suffer.

'And I shall be guilty in the eyes of the world until I have proved my innocence.' He let fall Mainwaring's hand, and, as if his last remark had clinched the matter, turned sharply on his heel.

Mainwaring, one of the youngest barristers at the Bar, was an able advocate; he was also a good judge of mankind, and he felt the truth of his friend's words. 'Poor Paton! Poor devil!' he ejaculated.

Once outside the court, Paton hailed a passing taxi. Though no one looked at him, he felt that the eyes of every passer-by were upon him,

No. 127.—VOL. III.

singling him out as the man who had escaped just punishment for a crime he had committed. He directed the man to drive to a restaurant near Victoria Station, one where he would be least likely to meet any of his acquaintances.

Half-an-hour later he sat toying with food on his plate, and reviewing the past month of his life. It was a month which had been to him a foretaste of hell, a month which had left its mark upon his soul as indelibly as it had upon his face. For four weary weeks he had fought the badgering of a counsel who had tried to prove him the perpetrator of a murder of which the world already counted him guilty—a crime against the very nature of which his whole soul revolted. Five weeks before, his uncle, a man of wealth, had been found murdered within an hour of Paton having been in the house. There were clues which pointed as clearly to his guilt, as there were others which denoted his innocence. Now he stood free, a rich man with the money his uncle had left to him, but with the mark of Cain upon his brow.

He rose, paid his bill, and left the restaurant. For a moment he stood on the pavement irresolute. Acting on a sudden impulse, he set out briskly to walk to his lodgings at the other side of the West End.

Jealousy, discontent, surged through his soul as he passed the jostling crowds coming out of the theatres. Even the chorus of cab-whistles beat mockingly upon his distorted brain.

It was long past midnight when he reached the square in Kensington where he lived.

At the sound of his key in the latch, his landlady and her husband came to the door to meet him.

'We thought you'd come back to-night, sir,' she said, 'so we got some supper ready for you.'

'Thank you,' said Paton dully; 'but I have just had some—at least an hour ago.'

'And, sir'—the woman hesitated—'we wish to congratulate you. There could only have been one end. Innocence always proves itself.'

'Thank you,' said Paton; 'it's very good of you!' He walked to the foot of the stairs as listlessly as he had spoken. There he paused for a second. 'You might have my bill ready in

[All Rights Reserved.]

MAY 3, 1913.

the morning. I shall be leaving London by an early train.'

His landlady watched him walk slowly up the stairs like one who is very weary or very old, and there was sorrow on her face. It was not all self-interest, though Mr Paton was a good lodger. Five years had proved his worth to her.

'It's a cruel shame!' she said to her husband.

He nodded and sucked at an empty pipe. 'And the rooms will be empty at the worst time of the year,' he responded.

CHAPTER II.

COLONEL LAVENON was a good soldier, he had served his country well, but he was a hard man. On the morning after Paton's acquittal he read a full account of the trial in the papers. He also read between the lines much that was not actually in print. His face grew hard as he progressed. He laid down the paper and walked across the room to his desk. There he commenced a letter to Paton. It was not an easy task to write it.

The colonel was still writing when a servant tapped at the door, then entered. 'Mr Paton would like to see you, sir,' she said.

'Ah!' The colonel did not know whether to feel relieved or sorry. 'You can show him in,' he said. Then he slowly tore up into small fragments what he had written, and, rising as Paton entered, gravely motioned him to a seat.

Paton was not surprised; knowing the man, he expected little else. Then his eyes fell upon the morning paper. 'You have heard the news?' he said. 'If not, my presence here is sufficient to tell you.'

'Yes, I have heard.' The colonel paused, choosing his words. 'And what are you going to do now? Of course your engagement to Kitty must end.'

Paton winced. Although he was not surprised, the words hurt him. They implied so much. 'I have come down to see Kitty, and to say good-bye; at least until I have proved my innocence.'

'Until then there must be nothing between you, for the sake of my child and her good name.'

Probably unaware that he was giving pain, for he was a narrow-minded man, Colonel Lavenon acted according to his lights.

Paton looked at him. For a moment a gleam of anger showed itself in his eyes. 'I quite understand,' he said; 'you look upon me as guilty.'

Since he could not deny the words, Colonel Lavenon sought refuge in silence, and it hurt the younger man.

'At any rate, you will allow me to see Kitty?'

'Certainly, for a short while.' Colonel

Lavenon walked to the door. 'I will tell her you are here.'

A few minutes later she entered—a tall, fair girl, pretty, with that fresh, pure prettiness which can belong only to the English girl. She advanced with hands outstretched, her eyes shining. 'Dick!' she said. All the love she bore him, all the suffering she had endured in the past month, were summed up in that one word. 'Dick!' she said again. Then she saw the look on his face, and her hands fell to her side. 'What is the matter?' she said. 'Surely it is all over now?'

Paton steeled himself for the part he had to play. Far harder he found it than the month when, hour after hour, he had fought for his life and honour. His voice was hard. 'I have just seen your father, and he has told me our engagement must be at an end.'

The girl averted the colour left her face. Then, woman-like, she saw that it was none of her lover's choosing. She laughed, and held up her hand. The ring he had given her gleamed on her third finger. 'You do not wish to break it off?' she said.

'I can do nothing else,' he replied. 'In the eyes of the world I am a murderer. I cannot ask you to link your life to mine, to have the world scorn you as the wife of the man you have chosen.'

She laughed, and there was a world of gladness in it. Love is all to a true woman—nothing else matters. 'That will make no difference. You love me?'

Paton took a step forward, then as suddenly stopped.

'Then I shall wear this ring until you ask me to come to you.' She placed her arms round his neck. 'I am yours, I could be no one else's, and I shall wait until my hair is gray if need be.'

He bent down and kissed her passionately. 'God bless you, dear!' he said. Then, side by side on a couch, they sat and talked of the past, and all it held that was so dear to them, and of the future with its uncertainty.

At last he rose. 'I must go now,' he said. 'Who knows when we shall meet again?'

Though there were tears in her eyes, happiness shone through them. 'You will find me waiting.' Then a happy thought struck her, one in keeping with her character. 'To-day is June 17th. Each June 17th you shall hear from me, just a line to let you know I still care. You will let me have your address?'

'Send it to Brentwaite,' he replied. 'He will know where I am. I shall always write to him.' Then he bent down and kissed her.

She clung to him, and at last he disengaged her from his arms. She heard the door close, and watched him walk down the path. 'God bless you, dear,' she said; 'and may He grant it will not be long before we meet again!'

Six hours later Paton sat in the room of the man he considered his one friend. Closer ties bound them than those which generally bind man to man.

Brentwaite listened to his story in silence. 'Yes,' he said, 'perhaps it is the wisest plan. I should do the same myself. Where are you going?'

'To Egypt. An old friend of the pater lives there. I dare say he will lend me a helping hand for his sake.'

It was long past midnight before he rose. He stood for a moment leaning against the table. 'And my uncle's money. I would not touch a penny of it—the stain of his blood is upon it so far as I am concerned; but I shall leave it with you. Spend what you like in endeavouring to clear my character. You will leave no stone unturned, promise me!'

Brentwaite gripped the hand held out to him. 'I promise,' he said.

'Thank you!' Paton let his hand drop. The next moment he had left the room.

Three weeks later he stood in the dining-room of Mr Theodore Bellamore's house at Alexandria. Mr Bellamore was a bachelor; a busy life had left him no time for matrimony. He was a short, stout little man, with a bronzed complexion and a pair of twinkling gray eyes which surveyed the world behind a pair of gold-rimmed eyeglasses. In order to contradict their mildness and give to his face an assumption of sternness, he wore his moustache turned up fiercely at the ends. The result pleased him, though it did not perhaps create exactly the impression he desired.

'And so you are Dick Paton, Henry Paton's son!' He shook the young fellow's hand. 'You were in long clothes the last time I saw you. Since then much has happened, eh?'

'Much!' assented Paton.

Bellamore gently pushed the young fellow into a chair. It was five o'clock, and the sun had begun to lose its overpowering heat. 'You've come over here to make your fortune?'

'Not exactly.' Paton looked at his host, wondering how much he could say. He read sympathy in the other's face, and unburdened his soul, unburdened it as he had done to no other man. It took a long time, and Mr Bellamore listened in silence.

'Poor boy!' he said when Paton had finished.

'Yes, I read all about it. I always have the London papers; keeps me in touch with the old country.' His thoughts were working quickly. 'Colonel Lavenon—I remember him—he was out here five years ago. The sort of thing he would do.' Mr Bellamore rose suddenly. 'Well, you won't find me treating you like that. You'll just take a few days' holiday to pull you round, and then we'll see what we can do. There's room for men with grit out here. If the administration isn't changed shortly there'll be the biggest row Britain has had for a few years. The Mutiny will be child's-play in comparison.'

Mr Bellamore drew out his watch. 'It's seven o'clock. I have dinner in half-an-hour. After, I'll take you to the club and introduce you round. We turn night into day here; it's cooler.' He laughed. 'I'll have a room prepared for you.'

There was a lightness in his step as he walked upstairs to give the order. The sight of Paton brought back old days and the memory of the boy's father. They had been chums until business had placed the miles between them. Even then, until Mr Paton's death, they had corresponded.

Half-an-hour in the rooms of the British Club showed Paton the position that Mr Bellamore occupied in Alexandria.

They were standing talking to a group of Anglo-Egyptians, when a tall, dark Englishman entered the room. He stopped to exchange a few words with Mr Bellamore, then passed on, after casting a quick glance in Paton's direction.

'Do you know him?' asked Mr Bellamore. 'He came out a few weeks ago. He lived in your part of the town, I believe?'

'Yes,' said Paton. His voice had sunk, and he followed the other with his eyes. 'Charles Graham is his name. I met him once or twice.'

'Charles Graham—oh!' Mr Bellamore nodded. 'He's known as Roger Standish out here. Funny sort of fellow, I believe. I don't know much about him myself,' he said. 'I wonder why the dickens,' he said to himself, in the security of his own room a few hours later, 'that fellow should want to come out here under an assumed name. Charles Graham!' He scribbled down the two names on a slip of paper, and locked it away in a drawer of his desk.

(Continued on page 362.)

THE CITIZEN SOLDIER: PAST, PRESENT, AND FUTURE.

By the Rev. C. PARKINSON, M.A., Chaplain to the Territorial Force.

THE Territorial Force, its excellences and its defects—more especially its defects—is a subject which has for some time past attracted a good deal of public attention, and has furnished a considerable amount of copy for the Press.

Nor is the subject an unimportant one, for upon what the Territorial Force is, and upon what it may become, depends to a great extent the question of how much longer military service in this country is to remain a voluntary service,

how long Britons are to decide for themselves whether the British nation shall undergo a soldier's training or not.

Rightly understood, the questions which men are asking regarding the efficiency of the Territorial Force are intimately associated with another question: Is there any possibility that this country may be invaded, either in the near or distant future, by a foreign army? Many people hear such a question asked with a smile of incredulity; that such a thing is possible is to them merely the idea of the foolish man and the alarmist. It is so long since British people have known war, except from the columns of the newspapers, that they cannot conceive the possibility that the day may come when they may see it in their midst, and may themselves be actors amid scenes of horror of which they have only read, and which certainly they do not realise.

Yet, after all, some of the most important events in our history are connected with the invasion of this country. We speak of our 'tight little island,' and feel as if, surrounded as we are by the sea, we were so much safer than those who have merely a land frontier. But the sea has not always availed to guard us from the incursion of a foreign foe. We ourselves, as a nation, are the product of three successful invasions: the Anglo-Saxon, the Danish, the Norman. Again, in 1588 the Spanish Armada was not looked upon as an imaginary peril by our forefathers. In 1805 the projected invasion by Napoleon was not altogether a foolish dream; and in 1859 men once more looked the possibility of a French invasion in the face. In the three cases last named no enemy indeed landed on our shores, but it was no foolish and cowardly panic which stirred the heart of Britain. Rather, it was the realisation of sober and level-headed men that what had not only been possible but had been achieved in the past, might be possible and might be achieved again; and that modern conditions, while in some respects they made such invasion less probable, in other respects made it more possible on the part of a determined and well-prepared foe.

With such a possibility is intimately associated the history of the Volunteer movement. That whole movement in the past, and its development in the present and in the future, is bound up with the belief that the invasion of this country is not an idle dream, a childish nightmare, but a dangerous possibility. The motto of our citizen army is 'Defence, not Defiance.' The members of the force cannot be sent overseas except at their own desire. And therefore the men of to-day who deride the possibility of invasion should, to be quite logical, advocate the entire abolition of the force, since its very inception and continued existence is based upon the possibility of invasion. Yet how many of those who regard invasion as a childish fear on the part of a few

alarmists would be prepared calmly to see the abolition of the Territorial Force? Few indeed would be quite so rash as that.

Let us turn first of all to the past, to that period of half-a-century which separates the rise of the Volunteer movement proper from the day when, by the Territorial Act of 1908, the Volunteer Force passed into the Territorial Force, with all its possibilities and all its anxieties.

It was the renewed fear of a French invasion in 1859 which gave birth to the Volunteer movement; and as we look back on those early days, whatever may be our opinion of the efficiency of the force at its inauguration, we can have nothing but admiration for the spirit which animated its members. That spirit was purely and unselfishly patriotic. Strange as it may seem, no monetary assistance, no equipment, were provided by the Government. All had to be found by the Volunteer himself, or was procured by him from his friends.

In 1861 two great reviews took place, in Hyde Park and at Edinburgh, and in these reviews eighty thousand men took part. It was not until considerably later that any part of the burden was borne by the State, but at length uniform and equipment were provided. In 1872 the first great Volunteer Force encamped on Salisbury Plain. In many ways those days were the days of small things. While so little encouragement was given to the Volunteer movement, and while there were so many disadvantages connected with membership of the force, it was perhaps inevitable that great prominence should be given to outward pomp and show, and that the harder and less attractive side of the work should be kept in the background. Largely associated with those days is the thought of the gay scene on the all-important review day, when admiring ladies watched their fathers, husbands, lovers, march in all their pomp and panoply past the inspecting officer to the stirring strains of martial music. And it was no wonder that this, the more showy side of Volunteer service, should be accentuated. Up to a very few years ago the force was not treated seriously by a large section of the public, particularly perhaps by that section which was glad of a plausible reason for excusing themselves from giving their own time and their own money. Criticism and ridicule were poured upon the Volunteer. Many things, no doubt, invited criticism, some things perhaps ridicule; but in reality no one had the right to laugh at or to criticise the Volunteer, except the Volunteer himself. The honour lay with him. In the face of Government neglect, of public indifference, of public ridicule, he showed his patriotism by giving freely of his time and of his money to fit himself, so far as he was allowed to do so, to defend his country in the hour of danger. We think of those days as long past, and things have altered much for the better, both within the force and in

public opinion regarding it, since the South African war of 1899-1902 laid to rest for ever the old taunt that the Volunteer was playing at soldiering; but up to very recent times a large portion of the force were armed with weapons more or less obsolete, weapons with which it would have been sheer madness to attempt to meet an enemy.

Little by little, as we trace the Volunteer from the early days, we find that the force expanded and grew in numbers and in efficiency. Annual camps and annual manoeuvres became a regular event; more and more, as time went on, did the more showy aspect give place to hard and unpicturesque work. All over the country Volunteer battalions and brigades were organised and attached to the regular forces; working hard, giving time and money freely, and not only, be it remembered, preparing for a possible time of national emergency, but helping in no mean way to stir up and to foster that patriotism without which no nation may hope to hold its own in the manifold competition of the world of to-day.

Almost fifty years separate the inception of the Volunteer Force from a year memorable in the annals of voluntary military service in Britain, the year 1908. In that year there came into operation the Act of Parliament which turned the Volunteer into the Territorial. There is no need to enter in detail into the changes which have taken place under that Act. It will suffice to say that its main object was to render the force better organised and more efficient, and to bring it into closer relation to the regular forces of the Crown. We no longer speak of the regular forces and the auxiliary forces as being two entirely different and independent bodies; they are classed together as the Imperial forces.

In part, at any rate, the objects specified above have been attained. There can be no doubt that a great improvement has taken place in recent years in the quality of the citizen soldier. In organisation, in equipment, in efficiency, there is hardly any comparison between the Volunteer of half-a-century ago and the Territorial of to-day. But, after all, the important point is not, how does the citizen soldier compare with his forerunner of a different generation, but how far will he stand comparison with the men whom he may be called upon to meet on the field of battle to-day or to-morrow? To the outsider, the man who has not studied the question, the man who knows little or nothing of the actual facts, it appears to be one very difficult to answer. On the one hand he sees those who speak as if in all respects the Territorial is able to cope with any situation which may arise. He is told that the navy is the important matter, and that no enemy is ever likely to be able to effect a landing on these shores. But, if so, why have a Territorial Force at all? On the other hand are those, and among

them men well qualified to judge, who would have us believe that the whole force is in a state of absolute inefficiency, unable to withstand, even for a day, any foe with whom it may come in conflict. The truth is probably to be found between these two opinions. Perfect the Territorial is not, and cannot be. The very conditions under which he serves forbid it. But neither is he quite useless; and even with his present opportunities of training, inadequate as they are, he would probably give a good account of himself in the day of battle.

But the question of numbers, of opportunity, of efficiency, is an important one; it grows more important every day. It will have to be faced in the near future more seriously than it has been faced in the past and is being faced in the present by those in authority.

Let us look, first of all, at the dangers with which we may easily be confronted. Imagine circumstances—and they are by no means impossible ones—under which this country may be faced with the alternative of war or an ignoble surrender to the threat of war; or with the necessity of helping our friends in the hour of their need, unless we would wish to stand shamed for ever in the eyes of all honourable men. At almost a moment's notice—for war comes suddenly nowadays—we are called upon to land, say, one hundred and fifty thousand men on the mainland of Europe. Our navy may be scattered over the face of the waters in all quarters of the globe, and, however strong as a whole, will certainly not be strong enough to leave an absolutely invulnerable force girdled round our shores, and at the same time ensure without any possibility of interruption the arrival of our food-supplies. Under such circumstances the country will have to depend upon the Territorial Force for immunity from invasion, or at the least for immunity from raids upon our eastern shores. The question for us is, can the Territorial Force, in its present condition, be expected to be equal to the task which will be imposed upon it?

What of its numbers? The necessity of pacifying the opponents of so-called militarism caused the requisite number of men in the force to be fixed at about three hundred thousand, though that number was undoubtedly too small. But we are already short of the number by some fifty thousand men, and the present year will probably witness a further decrease of nearly fifty thousand, owing to the fact that in a very large number of cases the four years' engagement is about to terminate.

What of equipment? Undoubtedly a tremendous advance has been made in this matter in recent years, and more especially in the five years which have elapsed since the inauguration of the Territorial Force; but in a great number of cases the Territorial of the present day is still armed with weapons inferior to those pos-

nessed by the men whom he would be called upon to face.

What of the training? Even allowing for the utmost energy and enthusiasm, is it possible for a minimum number of drills in the year, and fifteen days' (or in many cases only eight days') annual training, to fit men to face an army drilled to a high state of efficiency and trained in arms as regular soldiers? And how obviously futile is the assertion that though the Territorial might not be able to face highly trained soldiers at once, he would be able to do so at the close of six months' continuous training, undergone after the outbreak of hostilities! All history, and notably the events of the last few months, go to show that there would be no six months' grace allowed after the outbreak of war. War, if it comes, will be swift in its beginning, swift in its progress, swift in its end. In whatever state of efficiency or inefficiency the Territorial soldier is found on the outbreak of hostilities, in that state will he be called upon to meet the foe.

What is to be the end? There is no wisdom, but criminal folly, in evading or postponing the consideration of the vital questions which face us to-day. The voluntary system of military service which has been ours so long, and of which we are justly proud, is being weighed in the balance. Will it be found wanting? It is useless to discuss the point as to whether the invasion of this country is probable. *It is at any rate possible*; and therefore to be content with the improbability of its taking place, if indeed we could feel it to be improbable, is to trust not only our national prosperity but our

very existence as an Empire to chance. No wise man, no patriotic Briton, can be content with that. If the men of Britain possess the patriotism and the self-denial to come forward in sufficient numbers; if they can be ensured such adequate training, and that without being penalised in their civil employment, that they shall be able to meet on something like equal terms the armed forces of nations who have compulsory and efficient training; if they are armed with up-to-date weapons; and if they receive from the State and from their fellow-countrymen the consideration to which they are more than fairly entitled, then the voluntary system may survive. But if these things, or some of them, cannot be, then the day must come—and may it come before it is too late—when every able-bodied Briton will be compelled by law to fit himself for what is, after all, one of the most essential and the proudest duties of citizenship—to stand for his country and his home in the hour of danger, and to take his part in ensuring that no foe sets foot on British soil.

The question should be no political one; it should be no question of personal or private self-interest, of individual ease and comfort. It is a national question, a question of national honour, of national prosperity, of national safety. Upon the finding of a right answer to this question may depend the question whether there shall be peace or war, not only for ourselves but for the whole of Europe. Peace, indeed, every right-minded man and woman desires—peace with honour; and we may well remember the old but true adage, '*Si vis pacem, para bellum.*'

ATLANTIC GOLD.

By J. J. BELL, Author of *A Kingdom of Dreams*, *Wee Macgregor*, &c.

CHAPTER XII.

THAT night weariness proved stronger than worry, and Arcus slept sound. He was awakened in the dawn by a report.

'Trying to stop another ship for me!' he thought on collecting his wits, and made hastily to the window.

A big, white steam-yacht was entering the channel between the islands, and as he looked her anchor was let go. Almost simultaneously a boat was lowered, and a couple of rowers took their places. A tall man appeared on deck and descended the accommodation ladder. He got into the boat, which was forthwith headed for the shore.

'A bit sooner than Helmsdale expected!' said Arcus to himself. Debating whether he ought to dress or go back to bed till summoned, he continued to watch. Hubert, he noted, was not in the lookout, and he accordingly assumed that the report had come from the yacht.

Erelong the wall of rock hid the boat from his view, and he had five minutes to speculate on the probable causes of the yacht's early arrival, and also on the probable consequences of the visit for himself.

Then the tall man, who was dark, heavily moustached, and foreign-looking, appeared in the passage, and almost within the moment the watcher heard the house-door open. Whereupon the tall man flung up his hands in a gesture which might have been accompanied by the words '*Tout est perdu.*' His colour was ashen. Helmsdale met him half-way to the house, seized him by the arm, and hurried him thither. From the hall came muffled footfalls. The door of the sitting-room was closed, and presently, like an echo, that of the laboratory.

Arcus proceeded to dress. Ere his attire was complete he heard the reopening of the two doors, and a moment later a knock.

Helmsdale looked in. 'I feared the gun had awakened you,' he said pleasantly, though a trifle breathlessly. 'Well, you see that the *Phyllis* has arrived. Sorry it means that we must lose your company even sooner than we had thought, Arcus. Hubert is preparing breakfast, and the yacht will leave as soon as certain matters on Laskeir and the Other Island are set in order. After all, my niece and I shall be none the worse of a cruise on the *Phyllis*. I woke up this morning with the feeling that Florence was right—that I had been overdoing it. When you have breakfasted I shall be glad of your assistance, if you don't mind doing a little manual labour. Now, you'll excuse me. By the way, did you see my friend arrive from the yacht? Ah, you did! Poor creature! Been horribly seasick! Going back to his berth at once. Must look after him before he goes.' Helmsdale nodded and retired.

Arcus finished his toilet hurriedly. The news seemed too good to be true. He must see Florence speedily.

But when they met there was never a chance of private speech. A glance, a pressure of hands, and Helmsdale joined them. Breakfast over, Florence had packing to do; her uncle urged her to lose no time. To Arcus he said, 'I want you, please, to help Hubert with a boat-load of things that must be left on the Other Island.'

'Certainly,' was the young man's response. He must have patience, he told himself.

Helmsdale's voice was kindly. 'A thousand thanks! Hubert is at the beach. Good-bye, for the present, my dear Arcus. Forgive me for troubling you so much.'

On the Other Island Hubert respectfully took charge. 'If you will be pleased to take the engine and dynamo to pieces, sir—here are tools—I will see to the other things.'

Arcus had never before taken an engine or a dynamo to pieces, but with an 'All right; I'll do my best,' he entered the building, the door of which Hubert was holding open.

'If you require anything, please to call me, sir.' And Hubert, returning to the boat, started a series of burden-bearing trips between it and the dwelling-house.

Arcus wrought diligently, looking up from his task only to take breath or wipe away perspiration. Once or twice he saw Hubert passing, laden with packages and bundles, and, in response to inquiries, called out cheerily that he was getting along first-rate. It was not until after a long and unsuccessful tussle with a badly rusted nut that he deemed assistance necessary. Laying down the wrench, he went to the door.

'Hubert!'

There was no answer.

'Hubert!'

He was making for the dwelling-house, when he noticed that the boat had gone.

Presently he understood.

He was angry—much more angry than alarmed. Erelong he was scrambling up the iron ladders to the plateau. Once he was there, any lingering doubts of his host's intentions vanished.

The yacht was already under way, moving very slowly, to be sure, for Hubert had yet to be taken on board. That was accomplished some three minutes later; after which the *Phyllis* certainly put her best foot foremost.

Meanwhile Arcus could distinguish his late host, who had apparently forgotten all about him. At any rate, the doctor's back was towards the islands he was leaving.

As a matter of fact, Helmsdale had other business on hand just then. Having conducted his niece to her state-room, suggesting that she might be making her belongings ship-shape until Mr Arcus should come on board, he was now on the bridge-deck facing a smartly dressed officer whom he had caused to be summoned to his presence.

'Bunkers full, Harvey?'

'Well, no, sir; not quite full,' the man replied uneasily.

Helmsdale's face hardened slightly. 'You had your orders, Harvey. You know my rule. How full are the bunkers, then?'

'About—there was a strike on at' —

'Never mind that. The bunkers—answer!'

'About two-thirds.'

Helmsdale's brown fist took the man between the eyes; felled him. 'Curse you for a blundering fool!' Next moment he was kneeling beside his victim. 'But I doubt you've ended me, Harvey,' he whispered sadly.

A tremendous concussion smote the nerves of Arcus. For a moment he tottered where he stood. Then his gaze leapt from the yacht to his recent home.

A cloud of dense yellow smoke full of hurtling fragments—a crash and a silence—a darkness and a twinkling of fires—then spouts of flame and gusts of steam.

Dr Helmsdale, it appeared, was not coming back to Laskeir.

Arcus sat down weakly. By turns he watched the fleeing yacht and the oily conflagration of a house most hospitable. And long after the yacht had gone down, as it seemed, in the far south-west, and the house was a heap of smouldering ruins, he remained, groaning in spirit over his present impotence, his past simplicity that had allowed him to be so easily hoodwinked. Once he asked himself the question, why had not he suspected Helmsdale from the first? And the reader may ask it also. But, after all, does one suspect the greater villains of the world? Does one look askance at the rich man who frankly gives away his secrets, whose countenance is open

as his hand, whose susceptibility to praise, or flattery, is almost pathetic? Even so, Arcus had another excuse for his inferior perception and judgment. From the first, until the night on which he burst into the laboratory, he had looked at Helmsdale through the eyes, so to speak, of Florence.

His bitter reflections were at length interrupted, though not terminated, by a realisation of physical discomfort. The wind had risen again, and was blowing shrewdly from the east; the rain was coming, too. He got up and made his way to the bottom terrace, deeming that he could consider his position just as pleasantly indoors as out.

A great deal more so, perhaps. On opening the door of the hut he found the oil-stove burning, the table nicely laid with a cold luncheon, plus a pint of the rare burgundy he had more than once enjoyed on Laskeir. On his cheese-plate lay a letter:

'DEAR ARCUS.—I trust you may find your new quarters endurable. You may not have to occupy them long if you keep a bright lookout. However, you are provisioned for a month; though you may have to wash in soda-water before that period is completed. Pray make the best of your temporary imprisonment. I regret it should be unavoidable. With every good wish, and the assurance of my undying gratitude,—Sincerely,
VICTOR HELMSDALE.

'P.S.—When signalling, use two rockets or more. You get what you want in this world by being noisy and persistent. Sockets for firing—top of uppermost ladder. Should the weather become cold—looks like it now—you will find my sleeping-bag a comfort. Pardon haste.—V. H.'

Possibly Arcus's sensation of hunger over-

powered his not very robust sense of humour, for instead of laughing he sat down and ate. He also drank, and with the last glass of wine absorbed something like hope. Then, in a corner, he espied his own luggage, and on a shelf a thousand of the doctor's delectable cigarettes. He lay back in his chair and crossed his legs. All is not lost when a man does that. Nevertheless, his heart ached sadly for Florence, and his wits fell to work, planning the pursuit that would assuredly begin with his deliverance from the island. He would search the world, and he would find her! And—cheering thought!—she knew the name of his club in London.

But it would make a long story, and a dull one, to tell of his thoughts and doings—the former far exceeding the latter during the dirty weather that followed—on the lesser Laskeir. It was on the fifth morning that he sighted a whaler—the *Scot* again—jogging east with three bloated carcasses in tow. He did not spare the rockets; five went up to shatter the silence as fast as he could fire them.

The *Scot* came as near inshore as possible, for the sea was rough, and lowered her pram. Forgetting everything but liberty, Arcus began to descend eagerly—too eagerly. Less than half-way down the second ladder his foot missed the rung, his hand slipped from the wet rail, and he fell heavily upon the rock.

The Norwegians did what they could: bound up his head and limbs, got him on board the whaler with no small danger to themselves, laid him out in the tiny eating-room under the bridge, brought him every comfort they possessed, and shook their heads to hear his groans and incoherences.

And so at last came Stephen Arcus to his destination in West Loch Tarbert.

(Continued on page 357.)

SPORT AND ORNITHOLOGY ON THE BALTIC COAST. ON THE KURISCHE NEHRUNG.

By A. LANDSBOROUGH THOMSON, M.A., M.B.O.U.

ATEN hours' railway journey from Berlin took us to Königsberg, the capital of East Prussia and the most north-easterly of the big German cities. After Königsberg the railway to Russia strikes inland, and thus cuts off one of the out-of-the-way, seldom visited, and little-known corners of Europe. A glance at a map shows that a great part of this corner is taken up by one of the largest of the great lagoons, or *Haffe*, that fringe the southern coast of the Baltic Sea, owing their origin to the banking-up of river estuaries.

The Kurisches Haff, fed chiefly by the delta of the Niemen (or Memel), is nearly sixty miles

in length from south-west to north-east, and measures twenty at its broadest; and its only communication with the sea is a narrow channel near Memel, at the north-eastern corner, within a few miles of the Russian frontier. For the remaining distance, lagoon and sea are separated by a narrow spit of sand—the Kurische Nehrung. This sixty-mile isthmus of desolate sand-dunes—bordering on one side the brackish, almost tideless waters of the landlocked Baltic Sea, and on the other, from half a mile to two miles distant, the shallows and reed-beds of the great lagoon—is surely one of the most peculiar and interesting parts of our continent; and many

indeed are the features that claim attention. The seaward shore of the Nehrung is a dreary stretch of uninterrupted sand, lacking even the variation of appreciable tidal ebb and flow. Crossing the first low ridge of dunes, we soon come on the main sand-dunes of the isthmus, which are said to be the highest in Europe, in places almost reaching two hundred and fifty feet. At the narrowest parts of the Nehrung no high dunes are to be found, and at others they continue until they end in an abrupt sand-cliff falling away into the waters of the lagoon. But elsewhere we find a broad stretch of level ground between the dunes and the *Haff*—first, probably, a belt of woodland; then a stretch of meadow and ploughed land, interrupted here and there by large, isolated dunes; and, lastly, a little village with a jetty and a small fishing-fleet on the lagoon.

Five such villages are dotted along the Nehrung. Two are fishing villages of the smallest dimensions, with communication mainly by small boats, although an apology for a road runs along the isthmus; one is a considerable watering-place; and each of the other two, on the strength of a very primitive hotel and a couple of bathing-boxes, calls itself an *Ostsee-Bad und Kurort*. A small steamer plies backward and forward on the lagoon in summer, calling at the three larger villages. One of these, Rossitten by name, is of special interest as being the site of the German Ornithological Society's station, or *Vogelwarte*, chosen as such on account of the abundance of bird-life and the extent of the migration phenomena that are observable; and it was to Rossitten and its *Vogelwarte* that the lagoon steamer bore us one September afternoon. It is a two hours' sail from the Cranzbeek wharf, to which a train comes once every day from the ordinary terminus at Cranz.

Rossitten, about half-way along the Nehrung, is situated on the lagoon shore of an oasis of woodland, field, and meadow, surrounded by enormous dunes. A beacon, a jetty, the church, the school, the hotel, half-a-dozen villas, and a couple of score of cottages go to make up the village. The natives still speak Kurish, a dialect of the old Lettish language, and are mainly fishermen by trade. A number of cattle are also pastured, and a few acres of land kept under cultivation. Wildfowlers, too, the inhabitants are in season, and at times they labour on the dunes, which in the neighbourhood of the village require constant planting to keep them within bounds.

Countless acres of shifting sand, with huge dunes 'wandering' twenty feet or more every year, are no light responsibility; and all the ingenuity of the forestry department is necessary to stem the destructive invasion, for at many points the sand threatens to overwhelm fields and villages, as it has indeed overwhelmed them in the past. Various methods are employed, and

to study them the young forestry officers are sent to Rossitten from all parts of Prussia. A common device is to cover the surface of the sand with long palisades, usually running parallel to each other and at right angles to the prevailing wind, but sometimes in two series at right angles to each other. They are made of poles or boughs set closely together and projecting a couple of feet above the surface. Sometimes the strong stems of the ten-foot reeds that grow on the shore of the lagoon are deemed sufficient. Once a dune, which in itself would not be lasting, has become well anchored in this manner, afforestation begins in earnest; and when the trees are well established the conquest of the dune may be regarded as permanent and complete. A crescentic shape, two long arms curving away before the prevailing wind, is typical of a 'wandering' dune, and many fine examples are afforded by the Nehrung.

Much of the Nehrung is already well wooded, and much there is of wild life in these woods to delight the naturalist. Roedeer he may frequently meet, and with good fortune he may encounter in the depths of the forest the great elk itself. Once this good luck befell us, and suddenly, at the far end of a gloomy glade, and less than two hundred yards away, we saw one quietly feeding—a cow unfortunately, and not a broad-antlered male. But she saw us too, and after a long gaze retreated slowly from our view. On another visit to Rossitten we were less fortunate in this respect, but had the rare experience of tasting the flesh, an elk having been shot in the neighbourhood by a visiting German nobleman. 'Rare,' we say with justice, for the elk is a vanishing species in Europe; in parts of Russia and Scandinavia it is not uncommon, but in the German Empire it is only in this extreme north-eastern corner that it is to be found. Eastward it ranges through the forests of Asia to those of North America. In the last-named continent the name 'moose' is more familiar, and the animals are rather larger on the average.

Of all the animals which are characteristic of the Nehrung, first place must be given to the hooded crow. At all times it is to be found in abundance; but at the migration seasons, particularly that of the autumnal passage, it is present in almost incredible numbers. In Britain the hooded crow is not appreciated for sport or for the table; at Rossitten, however, it is not only fair game for the sportsman, but is netted in great numbers by the natives and preserved for winter food. One form of the sport is of great interest, whatever its other merits; and two days on which we accompanied a forestry officer for this purpose will long remain in our memory.

In this sport an eagle owl is used as a decoy, and we borrowed a splendid specimen which had been a captive for nearly twenty years. The eagle owl is a northern bird of partly diurnal

habits, and of much larger size than our common owls. It sometimes visits the British Isles during the winter months, but is native to the forests of Scandinavia. Living examples are in considerable demand in Germany for decoy purposes, and may be procured for about three pounds. It has been remarked that the English language, usually so rich in synonyms, possesses none for 'owl,' so that we must perforce use adjectives to distinguish the many different kinds; but in German this species has a name of its own—*Uhu*, from the cry. A snowy owl—another large diurnal species of more northerly habitat—is less commonly used; and sometimes a stuffed bird actuated by strings replaces the living decoy, and is called the 'grand duke' in some regions. Birds of prey are the 'game' which is always hoped for, but hooded crows usually form the 'bag.'

While the owl was cowering in a corner of its cage, hissing the while, and with its wonderful eyes literally blazing with fury, the safety-hook at the end of a short piece of strong cord was slipped on to the ring on the bird's permanent leather leg-strap. By this the now frantic bird was pulled out and ignominiously dropped into a bag provided with hoops. When we reached our destination, the owl was pulled out and tethered to a log in the open a dozen paces from the edge of the wood in which we were about to hide.

On this occasion, however, not even crows sighted our decoy, and our one piece of excitement was with the owl itself. The leather leg-strap, which apparently needed renewing, had given way, and we soon noticed that the owl was sitting rather farther from the log than its cord should have allowed. On our approach it set off on foot with noisy demonstrations of anger. If it had escaped it would probably have returned very soon to the cage which had for so long been its home; but apparently it did not fully appreciate its strange freedom, and made no attempt to take wing. While the bird was playing havoc with the cloak we had thrown over it, one of us managed to get it by the wings and hold it down on its back in such a way that no harm could come to it, although it was striking out madly in all directions with its great talons, to the accompaniment of continuous hissing and much bill-snapping. After a few trials we managed to knot the cord round one leg, and the owl was retethered.

The decoy, however, had had enough, and went to sleep on the ground, where it was too inconspicuous for our purpose. Time and again we roused it, and the bird would resume its perch on the log with a soft, resentful *oo-hoo*, only to come down again as soon as we were hidden. At length we gave up the attempt, and the bird was carried home in disgrace.

Next day a score of hoodies appeared before we were properly hidden, and my companion

brought one down almost at once. The others, not seeing where the shot came from, remained circling about, occasionally swooping in clumsy fashion to within a few inches of the owl's head. After a few moments of restlessness our decoy kept still, and remained supremely indifferent to these feigned attacks. But the mere imitation of the buzzard's *meow* was sufficient to make it instantly assume a defensive attitude—wings outstretched, face upturned, body crouching low.

Several more crows had fallen, and we were advancing to recover them, when suddenly the owl crouched ready to exchange death-grips with a goshawk poised a few feet above. Our friend fired hurriedly and missed, and like lightning the big hawk twisted and was gone.

The fowlers' methods are simpler. Some bait is spread, and a large, single clap-net arranged. At the proper moment the net comes over in response to the pull given by the man hidden in a little hut of reeds some yards away. Several crows are usually caught at each throw, and they are taken out of the net one at a time and *bitten* to death. Similar primitive customs exist in various places. The gunners of the New England coast are said to bite the brains of wounded birds; at Rossitten it is the throat.

Not all the crows thus caught suffer death, however, for Dr Thienemann, the director of the *Vogelwarte*, buys many of them alive, and sets them free after placing on one leg of each a light aluminium ring. Each ring is really a broad band of metal folded into a circle and fastened to the bird's foot by means of a simple clasp. The ring is stamped with the address, '*Vogelwarte Rossitten*,' and with a different identification number on each. As many as 12 per cent. of these marked crows are subsequently reported to the *Vogelwarte* as shot or recaptured, and the localities of over a hundred such records marked on a map give us a diagrammatic view of the movements of the hooded crows that pass through Rossitten on migration. The northernmost records are from the summer quarters in the forests of southern Finland and the St Petersburg district of Russia. From there the localities lie in a broad belt of country bordering the eastern and southern sides of the Baltic, southward through Livonia and Courland, then, turning at the angle in which Rossitten strategically lies, westward through northern Germany to the north-western corner of France. Other kinds of birds are also marked with Rossitten rings in the same way, notably black-headed gulls and storks, both marked as young birds, the former at a nesting colony close to the village, the latter all over the north-eastern provinces of Germany. In winter these marked gulls are found on various European coasts, rivers, and lakes, southward to Italy, the Balearic Isles, and even Tunis; while one has recently crossed the Atlantic to Barbados! The storks

fly south-eastward toward Syria, and are found through Egypt, the Great Lakes, East Central Africa, and Rhodesia, on to their winter quarters in Natal, Basutoland, Transvaal, and the Cape Province.

The *Vogelwarte*, the centre of all this work, situated a short distance from the village, is a small and unpretentious building which in itself is little more than a local bird-museum. A cursory examination of the crowded shelves will provide ample evidence of the richness of the bird-life of the *Nehrung*; and in some roomy cages outside a few living specimens are kept on view for a time, many of them finding their way later to permanent quarters in various German Zoological Gardens. In a large round cage standing by itself is our friend the eagle owl in its usual comical state of exaggerated fury.

But, interesting as are the collections of dead and living birds, it is still better if the ornithologist can spend some weeks at Rossitten, and see the wonderful autumn migration for himself. Little is known with certainty of the routes followed by the birds; but it seems that the migratory stream from part of northern Europe becomes concentrated at this south-eastern corner of the Baltic, and moves along the south-westerly trending *Nehrung*. Of the millions that pass, hundreds rest at Rossitten, for the surroundings of the village are like an oasis in that desolate area of sea, sand, and lagoon, and offer in a small space cover for many different types of birds. Reed-bed and open shore, meadow and ploughed field, woodland and marshy pond, all are found there, and each harbours in due season its appropriate but ever-changing bird-life. This oasis has naturally its own native avifauna, resident or emigratory; but this is as nothing when compared with the vast migratory hordes that merely pass through in autumn and spring. At Rossitten, as elsewhere, the autumn phenomena are on a greater and more magnificent scale than those of the vernal passage; the season is more drawn out, and the numbers of the birds are swelled by the young of the year, very many of whom will not survive the winter months even in the milder lands for which they are bound; some indeed will never complete that first perilous journey.

One aspect of the great autumn movement may be studied in the open shore of the lagoon and on the damp meadows that border it. Here are seen, sometimes in great numbers, many birds of the plover and sandpiper family, the inhabitants of sandy shores and tidal flats. Now it is the loud wail of the curlew, now the noisy whistling of the redshank, or occasionally the vociferous peal of the oyster-catcher's note that sounds along the shore. The small ringed plovers, dunlins, sanderlings, and the like are met with every few hundred yards, and one may often approach very close indeed to the restless, watchful, but seemingly confiding little bands.

Often fresh interest is aroused by a sight of some less common member of the clan—a knot, a little stint, a turnstone, or, if we are very fortunate, some rare Eastern species. Nor are the larger members of the family unrepresented by interesting forms. Now a greenshank makes the echoes ring; now we encounter a party of black-tailed godwits with long, up-curved bills; now we get a distant view—seldom more—of the wary gray plover. The gray plovers are for the most part in the dull garb of immaturity; but sometimes we may see the beautifully contrasted black and white of the plumage worn by the parent birds during the breeding season on the Arctic tundras, and not yet discarded for the winter. All this by day; and by night the cries and calls we have heard may be identified as the birds pass onward, high above and unseen.

On the lagoon shore there are many other birds. Black-headed gulls and common terns nest beside a marshy pond near Rossitten, and many are still in the neighbourhood, although the terns leave early in autumn. Gulls of other species there are also, and mallard, sheldrake, and other ducks, both on lagoon and sea. Occasionally a stately heron rises from the water's edge, and flies off with slow, telling strokes. It is a common occurrence on the lagoon that a dozen families of great-crested and red-necked grebes should be in sight at once; without changing our position we have counted eighty of these birds on the water.

The woods have their appropriate migrants, chief among them the great spotted woodpecker. We hardly think of it as a traveller; but its varying numbers and its occasional occurrence among bushes far from the nearest woods betray the fact. The trees also shelter small titmice and goldcrests, and large birds of prey.

A wealth of small birds exists in the neighbourhood of the village. In the potato-fields there are chaffinches, in the meadows titlarks and wheatears, in the bushes warblers, on the shore white wagtails, on the houses swallows, and many more. Starlings are much in evidence; sometimes the flocks are seen passing overhead or arriving in the evening, and every night as the season advances larger and larger numbers roost in the great reed-beds after the usual noisy evolutions in and around the tree-tops. The migrations of the thrush kind—song-thrushes, fieldfares, and redwings—have not yet begun; but by the end of September there is abundant evidence that the jays and others of the crow tribe are on the move.

On the *Kurische Nehrung* one always comes back to the hooded crow, and the migration of that bird so typical of the region is the most wonderful sight of its kind that we have ever witnessed. It was on 2nd October that they first came in numbers, and we betook ourselves

to the seaward shore to watch their passage. The scene was an impressive one. Imagine that narrow strip of sandy shore on which we stood, stretching uninterruptedly as far as we could see, north-eastward toward Russia and south-westward toward the Gulf of Danzig. On one side lay the quiet waters of the almost tideless sea; on the other rose a line of low dunes over which the tops of the trees behind peeped here and there. The extreme loneliness of the landscape was emphasised by an old fishing-boat drawn up on the beach—the only human mark within the circle of our vision. The silence was complete but for the rhythmic murmur of gentle waves; a slight breeze blew from the south-east; and the sky was lightly clouded at a great height, leaving the lower air markedly clear. The sun shone brightly, but the keen nip of October was in the air, showing that despite the glorious weather the autumn had entered on its final phase and winter was at hand. The steady progress of the crow battalions told the same tale. Every minute or two a flock passed, flying steadily and quietly south-westward along the line of the shore at a height of from one hundred to three hundred feet. Hooded crows were in the majority, rooks numerous, and jackdaws present in smaller numbers; rooks and crows were generally in separate flocks, the daws accompanying the former. If we watched one flock pass overhead and recede in the distance, another was already passing before it had disappeared, and a third would be coming into view in the wake of the second. The line of the shore seemed to be followed with some exactness, for a bend a quarter of a mile north-east of us caused the flocks to fly out over the sea for a few hundred yards before they wheeled to take the slightly altered direction. In size the flocks varied from thirty or forty to two or three hundred birds; and we calculated that over two thousand birds passed every hour in an unbroken stream from early morning till after midday.

Next day was as beautiful as its predecessor, and the number of migrants greater than ever. The sight was not witnessed from the beach near Rossitten, but from the post-wagon, a ramshackle, springless contrivance with four wheels and two horses, which bore us the twenty odd miles to the railway instead of the little steamer now laid up for the winter. Our course lay along the rough *Nehrung* track in the south-westerly direction. At first we saw little bird-life, for we were at the lagoon side of the *Nehrung*, which is nearly two miles broad near Rossitten, and the stream of migrants follows the seaward shore. But after we had jolted along for a few miles, woods and fields were both left behind, and we came to a narrow stretch where sea and lagoon were visible and close at hand on each side, with nothing but sandy waste and our road between. Here we seemed in the midst of the

migratory stream, and felt as if we had been caught up by it and were being borne along in it, if somewhat slowly. Crows there were, as on the day before; but the flocks were larger and more frequent, and continued to pass till well on in the afternoon. Some twenty or thirty thousand must have passed in the course of the day. It was not merely the vastness of the numbers that made the scene so impressive, but the fact that all these thousands were following the same instinct, were moving together with one accord, without great speed or appearance of haste, yet without halt or deviation, and still more notably without noise. So accustomed were we to the ordinary vociferous demonstrations of the crow tribe that we could not fail to be struck by the fact that only two or three times during the whole day did we hear a single *caw* from these passing thousands. Herein lies a difference between the crow migration as observed here and on Heligoland; for when the crows come over the island they indulge in noisy calling, and often stop to circle about or even to alight. A more important difference seems to be that here the great army is advancing in column—a column of great length but of no appreciable frontage, and apparently without any parallel columns in its near neighbourhood; whereas, according to Gätke, the crows that pass over Heligoland do so in a broad stream which may extend on each side for a score of miles, and probably often for far more.

Not only was there a continual succession of these silent flocks of hooded crows, rooks, and jackdaws, but small song-birds were also on the move. Every few seconds a small company of larks or a little band of finches passed us flying low down near the ground. Overhead, at a considerable altitude, were less frequent flocks of wood-pigeons, making more speed than most of the others. Here and there were a few birds of prey; kestrels were frequent, usually alone, sometimes three or four together; and often, at our approach, some larger predatory species would rise on broad wings from a meal provided by some weakling bird which had paid too high a price for the journey.

A narrow strip of barren sand bounded by expanses of desolate water made up the landscape that shimmered in the bright sunlight of that crisp autumn day. Nothing else was in sight but our wagon and its occupants and the vast flocks of birds, and every bird was moving onward with the stream. It seemed to us that we were watching the ebb of the life of half a continent, an ebb which would leave the northern forests deserted and voiceless in the deathlike grip of the sub-arctic winter; but we remembered that this same channel would in a few more months convey a contrary tide which would again fill these lands with the active bustle and cheerful sounds of feathered life.

DIANA AND THE DESTROYER.
A NAVAL STORY.

By GEORGE FREDERICK COTTON.

PART I.

'DIANA, Havana, Susanna, her manner. No; Diana, her banner, outran her, can span her. Jove, doesn't she dance beautifully? Lemme see. Diana, Diana, Di—— Oh, hang it all, I wasn't meant for a poet! Pzt!'

A crumpled piece of white paper shot over the top rail, and the commanding officer of the *Rook*, ruefully thrusting a battered cap farther back on his curly head, strode along forward. As he passed the engine-room hatch a grimy artificer engineer emerged from its depths.

'How is it, Mr Manicom?'

'All oil an' energy, sir. 'Ark at 'er!' The engineer cocked his head to the hiss of the valves. 'We'll show the old man as clean a pair of 'eels with 'is despatches as ever 'e'd wish for, I lay.'

Lieutenant Bethune nodded and went up on the bridge. At the far end three seamen were gathered round a signalman, who was looking landward through a telescope.

'Wilcox!'

Four somewhat sheepish-looking faces turned about quickly enough.

'D'you expect to see the admiral coming down the beach in a motor-car? What?'

'There—there's a sorter scrimmage goin' on at the old pier, sir,' said the signalman deprecatingly.

Bethune turned a careless eye shoreward. A large yacht was moving away from the pier-end. A few people seemed to be watching her, but the lieutenant could see nothing to excite attention. He proceeded to test the engine-room telegraphs. 'There'll be another sort of scrimmage if we don't spot the admiral as soon as he thinks we ought to,' he remarked as he stepped off the bridge. 'See to it, men!' He went down to his cabin. There was an aunt living in a little vicarage four miles away. She was a good old soul—or used to be, he remembered somewhat regretfully, for he knew that Aunt Matilda had had small attention from her careless nephew. He reached for a pen. Anyway, if she did not know Diana Lovelace, she might know some one who did. He was still biting the end of the pen when a knock came at the door. 'What is it, Larkin?'

'There's a lady a-swimmin' on board, sir.'

'A lady! What?' Bethune's voice was enough to scare more than a newly rated O.S.

'Swimmin' on board, sir—in the water,' gasped the youth, and bolted.

Bethune stood staring at the open doorway. Then, wondering which of the two was going

mad, he went after him. 'My ship, but the boy's right!' he exclaimed as he reached the deck.

The whole of the crew were excitedly watching the rapid progress of the swimmer toward the destroyer.

'What on earth is she about?' thought Bethune, as he noticed that she was in everyday dress. 'But she can swim, though!' he added admiringly, as he saw the ease with which, in spite of the encumbering petticoats, her powerful overarm stroke drove her through the water.

In a few minutes she had reached the quarter-deck ladder. As she turned her face up, Bethune uttered a cry of astonishment and sprang down to meet her. A moment later he was assisting on deck his partner of the night before.

With the utmost nonchalance she stooped to shake free her dripping skirts. Bethune stood looking on stupidly. Words appropriate to the occasion failed him. Then, thrusting back her dishevelled hair, she recognised him. 'Oh Lieutenant Bethune, I hoped it would be you! Have you got steam up?'

Bethune stared. 'Ye-es,' he said blankly.

'That's splendid! Then we can start at once. Quick, or Lottie will be frantic. What are you looking at me like that for?'

'I—I don't understand. Start where?'

Miss Lovelace stamped a wet little foot on the deck. 'Where? Why, after the yacht, you stupid! Major Rawton's yacht.' She pointed to a thirty-footer, racing with spinnaker set before the breeze. 'Didn't you see him carry off little Billy on the pier? Lottie is raving, and Jack is away, and what will happen if we don't get him back I don't know.'

Some idea of what had happened dawned on Bethune. He looked at the yacht and at Miss Lovelace, and hesitated. 'The admiral'—he began.

'Oh, bother the admiral!' cried the girl with another vicious stamp on the deck. 'You must go.' Suddenly her demeanour changed, and she gave Bethune a bewitching look of confidence and entreaty. 'You will go, won't you, Lieutenant Bethune?'

Bethune succumbed to the spell. 'Bother the admiral, too!' he cried, throwing himself into the adventure with all the abandon of a lover. He gave a few sharp orders, and the men, who had been interested spectators of all that had passed, jumped to obey them. They were ready to do anything for this ruddy-haired sea-maiden who had taken possession of the ship. Only old

Sparshott, the torpedo coxswain, shook his head as he went to his post behind the helm wind-screen. 'It warn't do,' he muttered to himself; 'it warn't do. Bother the admiral, eh? It warn't do.'

Miss Lovelace, seemingly oblivious of her soaked condition, watched the proceedings with interest.

Bethune, however, having seen things in train in one direction, took charge in another, and with a sailor's bluntness went straight to the point. 'I say,' he said, 'you're pretty wet, you know, and there'll be a tearing breeze when we get going.'

Miss Lovelace looked down at herself with a comic little lifting of her eyebrows. 'I suppose it is a little rash,' she said, 'although I'm not exactly made of sugar. But, you see, I haven't brought my maid; she doesn't swim.'

'I think, as you are temporarily one of my crew, you must let me find you a uniform. I will see my steward, and you must consider him and my cabin as entirely at your disposal during your stay on board.'

Miss Lovelace gave the lieutenant a straight, friendly little glance under the tangled masses of her auburn hair. 'Thank you very much,' she said with simple frankness.

Ten minutes later, to the delight and admiration of the crew, a lithe young figure, whose gracefulness could not be disguised by the voluminous overcoat which wrapped her to the toes, and whose abundant locks would not be kept in order by her service undress-cap, glided easily along the palpitating deck of the *Rook*.

'May I come up on the bridge, please?'

Bethune hastened to the ladder. 'By all means, Miss Lovelace.'

The girl took a comprehensive glance round. Straight ahead, under a tremendous spread of canvas, surged the yacht, their quarry; and away on the right, rounding the high cliffs at the end of the bay, a large warship was standing in, with a string of little flags flying from her tripod mast.

'What is that ship?' asked Miss Lovelace.

'That's the flagship.'

'Are they signalling to you?'

'Yes.'

'What are they saying?' persisted the girl.

Bethune glanced aside at Wilcox taking in the message. 'They are asking us what we are doing,' he answered gravely, with strict adherence to truth.

'Oh! What are you going to tell them?'

'I'm going to say we are performing evolutions,' said Bethune with a smile.

The girl looked thoughtful. Evidently something else than the yacht and little Billy was for the moment in her mind.

Bethune turned to look at the yacht, whose name, *Carina*, could now be clearly distinguished. 'What made him do it?' he asked.

The girl started and flushed hotly. She hesitated for a moment, and then burst out impetuously, 'Oh, I don't mind who knows! He wants to—to marry me, and because Jack—he's my brother, you know—stood up for me, he thinks it's all due to him, and he swore he'd get even with him. But we didn't think he'd do anything like this. And he's Lottie's cousin, too. Oh, I could thrash him!' The girl's eyes flashed, and her breath came short between her parted lips.

Bethune was filled with righteous indignation. One thing was clear to him—that Major Rawton was now his personal enemy. How dared the fellow make love to Miss Lovelace against her will?

The distance between the yacht and the destroyer rapidly lessened, but there was no sign of Miss Lovelace's nephew on board the *Carina*. As the destroyer got within hailing distance, a tall, soldierly man, in immaculate yachting clothes, emerged from the companion, and raised his cap to Miss Lovelace with studied courtesies.

That lady muttered something under her breath which Bethune did not hear.

The lieutenant picked up a megaphone.

'*Carina*, ahoy!'

No response.

'*Carina*, ahoy!'

The man on board the yacht sat down in a deck-chair, and coolly proceeded to roll a cigarette.

Bethune turned to Miss Lovelace. His eyes glinted dangerously, and his mouth looked very grim. 'He's ignoring us purposely. The boy's down below, and he thinks that we shall be afraid to come near the yacht for fear of running her down and injuring the boy.'

'What shall you do?'

Bethune did not seem to hear. He raised the megaphone again.

'*Carina*, ahoy! If you do not heave-to we shall fire on you.'

Without looking up, Major Rawton struck a fusee and proceeded to light his cigarette. Probably he thought, as did Miss Lovelace for a moment, that the lieutenant was angrily voicing an idle threat.

But his crew knew their commander better, and when he sharply ordered the twelve-pounder on the fo'c'sle to be manned and loaded they set about it with alacrity, not unmixed in one or two cases with concern at the gravity of the step.

Miss Lovelace also looked rather scared, but she said nothing.

Bethune went forward to superintend the operations personally, and barely a minute had passed since his last message to the yacht when he stepped back. 'When you're ready,' he said to the gunlayer.

'Bang!'

The effect was electrical. Shocked out of his theatrical pose of indifference, Rawton leapt to his feet, as a clean round hole appeared in the mainsail above his head, close by the heel of the gaff. His face, dark-bronzed by Indian suns, was working with alarm and rage; but before the words could come a little white bundle staggered out of the companion, and, running with uncertain steps across the deck, clutched him round the legs.

'Uncle Dick, Uncle Dick, Uncle Dick!' came the piping treble across the intervening water.

The man, probably unconscious of what he was doing, roughly swept the child aside. The boy staggered away and fell against the guard rail. At that moment a sudden squall struck the yacht, she gave a lurch, there was a flash of white over the side, and Rawton was alone on her deck.

A piercing scream came from the bridge behind Bethune. Rawton turned, stood aghast for a second, then, running to the yacht's side, leapt over after the boy; for, whatever the man might be, he was no coward. But the lieutenant did not see him. Miss Lovelace's cry was still ringing in his ears as he struck the water, before Rawton had even grasped what had happened.

The lifeboat of the *Rook* was lowered in record time; but long before it reached him Bethune, who was a fast and powerful swimmer, had the boy safe. The little chap's clothes helped to keep him afloat, and the drift of the tide carried him toward the lieutenant. Bethune was treading water, wondering what had happened to Rawton, when a lusty shout reached his ears: 'The skipper, sir—the skipper of the yacht—just behind you, sir.'

Bethune turned, and just managed to get to Rawton before he sank. The major lay without struggling, and Bethune had little difficulty in keeping him and the child afloat until the lifeboat came up.

As the boy was being taken into the boat Rawton opened his eyes and looked round. The yacht's dingy was fast approaching. 'All—right!' he gasped. 'You—you've won. I'll go back to my own ship.'

PART II.

MISS LOVELACE came up on deck. 'He's quite happy with the steward,' she said gaily. 'I don't think he'll take a bit of harm. Wasn't it an adventure?'

Bethune smiled, and they both turned to look at the *Carina*, now a white dot on the horizon. Not far away from the yacht was another vessel, hull down. Bethune knew she was the destroyer carrying the despatches which his ship should have taken.

Miss Lovelace interrupted his unpleasant train

of thought. 'What did he say to you in the water?' she asked.

Bethune looked at the merry, roguish face under the naval lieutenant's cap. 'He said, "You've won,"' he replied.

'Yes, so you have!' said the girl. 'And, oh,' she went on gravely, 'I am—we shall be—so very grateful and thankful to you!'

'Yes; but not all I want to win,' said Bethune earnestly, although his voice was not quite so steady as usual.

Miss Lovelace looked at him quickly, and then turned her head away. Bethune saw the colour stealing up behind her ears, and trembled. A small brown hand lay on the rail before him, and, with a muttered prayer to his gods, Bethune covered it with his own big fist. And his heart leapt within him as the little hand lay still.

They stood thus in silence as the destroyer slowly steamed back to her moorings.

It was the girl who broke the spell. 'Look!' she cried suddenly; 'the flagship is speaking to you again, isn't she, with that signal thing? What are they saying this time?'

Bethune sighed inwardly as he studied the semaphore, and speculated as to the effect of his rash doings that afternoon on his future career. Vice-Admiral Sir Charles Bywater was an officer of the old school, and his views upon the conduct of an officer—especially a junior officer—were strict. Well, it couldn't be helped. Bethune shrugged his shoulders. He must trust to his luck to get out of the scrape in the best way possible. Then he started as he realised that Miss Lovelace was still waiting for an answer. 'I beg your pardon,' he said. 'I—I was reading the message. The admiral wants me to go and see him this evening.'

'Oh! What does he want to see you for?'

'Um! Perhaps he wants to ask me to dinner,' said Bethune without the vestige of a smile.

'Oh!' Miss Lovelace shot a quick glance at her companion, and then paused, with her head on one side, listening. 'Hark! was that Billy?'

'I can't hear anything,' said Bethune.

'I thought I heard him call. I hope he's all right.' The girl looked at Bethune with wide-open, startled eyes.

'Shall I go and see?' asked the lieutenant.

'Oh, would you mind? Thank you so much!'

Miss Lovelace watched him swing off below, and then went quickly up to Wilcox the signalman. A hurried conversation ended with the passing of a piece of silver, and Miss Lovelace returned, with reflective eyes and a determined look about her lips, just as the lieutenant came up on deck.

'He's perfectly all serene, Miss Lovelace.'

You must have heard something else, and imagined it was the boy.'

'Poor little Billy!' murmured the girl. 'See, there's his mother, in the boat, waiting for us. You must come up and let me introduce you to Lottie.'

'Not this evening,' said Bethune.

'Oh, I forgot that you're going to dine with the admiral!' said Miss Lovelace solemnly.

The lieutenant turned away to hide a smile, and no more was said until Billy, grinning contentedly from among his blankets, was handed over to his overjoyed mother, and Miss Lovelace made ready to follow.

'I wonder when we shall meet again,' said Bethune as he took her hand.

The girl looked him in the face, and suddenly broke into a dazzling smile. 'Perhaps sooner than you think,' she said, and was gone.

The admiral looked sternly under his bushy eyebrows at the lieutenant standing at attention before him, and cleared his throat. 'Mr Bethune'—he began.

There was a commotion at the door, and the concerned face of the admiral's steward appeared. The next moment Miss Diana Lovelace, radiant in a wonderful dinner-gown, sailed past him into the room.

'Eh, eh, Diana! what's the meaning of this?' blurted out the admiral.

Miss Lovelace swept him a curtsy. 'I've come to dine with you and my—my friend Lieutenant Bethune,' she said sweetly.

'Eh, what the devil—— I beg your pardon, my dear; but you don't understand. I've got important business with this officer.'

'Yes, uncle, I know; about those despatches of yours which he didn't take.'

The admiral leant back and stared at his niece in amazement. 'And what on earth has it got to do with you, miss?'

'A lot,' said Miss Lovelace calmly. 'You see, little Billy had been kidnapped by Major Rawton, and taken off in his yacht.'

'What!' The admiral suddenly sat up, his fine old face flushed, and his eyebrows working up and down quickly, as was his habit when angered or excited. 'Little Billy, my grandson, kidnapped by that scoundrel?'

'Yes,' said Miss Lovelace. 'Major Rawton carried him off in his yacht, but Lieutenant Bethune got him back for us.'

'Lieutenant Bethune!'

'Yes, uncle. I swam off to his ship, and made him go after the *Carina*. And then Billy fell overboard, and Major Rawton went after him, and Lieutenant Bethune rescued them both.'

'Humph! One rescue too many,' grunted the old gentleman. He looked at his niece, and at the lieutenant, and then at Miss Lovelace again; and a little twinkle began to come into

his keen gray eyes. 'So you made him go, did you, eh! And since when have you been in the habit of making my officers disobey my orders?'

'Well, you see, uncle,' said Miss Lovelace, placing herself comfortably on the arm of his chair, 'I knew there were plenty of other officers to carry out your orders, while there was only one officer who could carry out mine.'

The admiral chuckled his niece under the chin. 'Well, well,' he said, and turned to the hopeful lieutenant. 'Mr Bethune.'

'Sir.'

'Your dereliction of duty and insubordinate conduct in ignoring my signals will, on this occasion, be overlooked, in the circumstances as explained by this lady; but don't let it occur again. For next time the lady might not be the niece of the admiral, nor the boy his grandson. You understand?'

'Yes, sir. Thank you, sir.'

'And we dine at eight o'clock, Lieutenant Bethune,' said Miss Lovelace demurely.

There was silence for a moment. Then the admiral could not suppress a smile.

'Well, upon my word, my lady, you seem to think myself and my whole fleet are under your orders!—Well, well! all right, Mr Bethune; and you're a lucky dog—d'ye hear?—a very lucky dog, sir.'

ILLUSIONS.

WHEN we seem to be growing unpleasantly old,
As is mostly the case as a rule,
The truths which to-day we are able to hold
Are not those which were taught us at school.

'Tis to me, I confess, inexpressibly sad
That old lessons must needs be unlearn't;
That Stephen, for instance, was not wholly bad,
And Joan of Arc never was burnt;

That John was a good sort of king in the main,
And how Mary and Cromwell are placed;
Whether either did aught of which men might
complain
Is merely a matter of taste.

Near a village in Yorkshire, I quite understood,
And when staying there often have heard,
That the last wolf in England was killed in a
wood
In the reign of King Richard the Third;

But the tale may have sprung out of somebody's
head,
And it would not occasion surprise
If the next man I met, or the next book I read,
Said the whole was a tissue of lies.

Contrast things as they were with the same as
they are,
And you'll all be inclined to allow
That everything then seemed more certain by far
Than anything seems to be now.

THE STORM-TRACK IN TURKEY.

By R. A. SCOTT-JAMES.

IT was still pitch-dark when I heard Alexandre's knock at the door. 'Monsieur, it is four o'clock, and the Commissary of Police has arrived.'

Already I heard that slight rustle of movement which precedes the dawn in the Near East. It was a quarter of an hour before I myself tumbled out of bed to prepare for the long day's journey, which must be well advanced before the sun is high in the heavens. For several days I had been snugly quartered in that pleasant little Greek hotel in Monastir. M. Naoum, the proprietor, had driven away my faithful Alexandre, and had conducted me hither and thither about the town, showing me mosques and churches, conducting me to the houses of the Greek Bishop, the Vali, and such other notables as the city could boast. Daily the British consul, Monsieur S—, and myself had lunched and dined together in comfort, and three times I had been into the presence of the man who was then the master-agent of Abdul Hamid, the clever Hilmi Pasha, who has since been Grand Vizier at Constantinople under the young Turkish régime, and now represents his country at Vienna.

Like every one else at that time, I knew nothing of the approaching Young Turkish revolution, or of that armed alliance between Greece, Bulgaria, and Serbia which was to humiliate the Turk. On that morning, as usual, I made the most of the hand-basin and the slender jug of water with which the traveller has to be content in a land innocent of baths, splashing myself freely over the uncovered boards which constituted the floor of my bedroom. When I came down into the garden-café M. Naoum greeted me with the customary wave of his hat, and escorted me, in his suave, courteous manner, to my open-air breakfast-table. M. Naoum spoke nine languages fluently, and told me that he intended to take the first opportunity of acquiring a tenth, the English; and he mirthfully repeated the seven or eight words he had learnt from me. But again Alexandre appeared.

'Monsieur, the carriage has been here for some time.'

'The carriage!' That was the name they gave, in French, to the disreputable, tumble-down vehicle, shabby, dirty, springless, which was to carry us, jolting and groaning, over a score of

miles before midday—the vehicle which was thrust on us mainly by the necessity of carrying that unwelcome companion, the Commissary of Police. Unwillingly enough had Hilmi given me permission to travel westwards through the villages of the province; the Commissary as a companion had been one of the conditions of my journey.

The sun was just rising as I clambered into the carriage. All the hotel was assembled to bid me God-speed. My Bulgarian driver adjusted the shabby harness of the three horses, and fixed a white handkerchief under his fez to keep the sun from his neck. Two poorly clad gendarmes, dirty, sullen Anatolians, with rifles slung over their shoulders and great cartridge-belts round their waists, twisted their horses round ready to accompany me. But where was the Commissary of Police? Alexandre looked round him in alarm. Not for worlds would he start without the Commissary of Police. 'Commissary or no Commissary,' said I, 'we are already late, and we must be off.' I bade Alexandre get into the carriage, and the driver was unwillingly preparing to whip up his horses for the start, when up came that short, thick-set officer, panting, apologetic, full of reasons, that never-to-be-forgotten Commissary of Police!

'Monsieur, a thousand pardons! I had been here before, when you were in bed. I have been making preparations . . .'

In short, he had arrived. He waved Alexandre away from the seat by my side, and Alexandre with reluctance yielded up his place.

The driver shouted to the horses, and away we clattered, the bells on the harness jingling loudly, the wheels creaking and leaping over the boulders which lay in the street; even the dogs, lords of the road, creeping a little nearer to the path before they settled down for their daylight slumber. We passed the noteworthy structure which is one of the glories of Monastir, the theatre, where only last night the Vali and myself had witnessed the discomfiture of Faust when the lamp which lit the stage fell with a crash at the feet of Margaret. We saw the cupola of a mosque gleaming in the early moonlight, and not far off the pretentious outlines of the Greek church. We turned up out of the town into the avenue which leads past the

barracks, and the sound of strange military music burst upon our ears, for Macedonia was an 'occupied' country, and at this moment there were seven thousand troops in Monastir alone. And then the houses disappeared and the highway dwindled into a dusty track. A few miles off on our left stretched a long line of bleak, gray mountains, destitute of verdure. On our right the view was limited by the rising ground of other mountains. Now and again we passed some tiny hamlet or a farm, or a peasant seated by a trough watering his oxen.

M. le Commissaire talked. How he talked! He talked incessantly of this trifle and of that. He had a pock-marked face and an obstinate jaw, and he knew that Alexandre, the youthful adventurer, hated him as a representative of the despotic authority of the Sultan, and therefore an enemy of his race. How he twitted Alexandre, and frowned under his retorts! But they thought it politic to appear friendly—Alexandre because he dared not offend a Turkish official, and the Commissary because he wished me to speak well of him to the Vali.

Our road had taken us along the lower slopes of the mountain-range to the north of us; now it began to descend by an easy incline into the broad plain which opened out before us. Though it was no more than nine o'clock, the sun had already acquired its overpowering August heat, and the stream in the distance, and occasionally a tree, and not far off a village were welcome sights. As we approached nearer to this inhabited spot I became aware of a cloud of dust, and in the midst of it a straggling file of men plodding along in disorderly array.

'Soldiers!' said Alexandre, eager as usual to show me the military character of Turkish life.

There must have been several companies of them; the rear portion we passed on the road. They seemed to wander along the rough track without order or reason, dully, mechanically, wearily. Their uniforms were dusty and often ragged. No two men seemed to be clad exactly alike, save that each had a rifle slung over his shoulder and carried some sort of knapsack or bundle. Their trousers were baggy. Some wore gaiters, some were without. Some had taken off their military jackets in the heat of the march, and carried them under their arms. A few had hung cotton handkerchiefs under their fezes to keep the sun from their necks. All looked glum, sullen, and brutalised under the miserable conditions of their service.

We came into the little village of Kazania, with its pleasant stream and its grateful shade of trees—a village which had escaped fire and sword in the insurrection which but a few months before had devastated the country. The inhabitants had disappeared within their huts at the approach of the soldiers, and only a small general store-shop on the left of the road showed any signs of life. We passed it; but a little beyond

I called to the driver to stop, and he drew up where, as it happened, we were almost hidden by the houses at the bend of the road. Our gendarmes had gone on in front.

The foremost members of the company of soldiers were approaching the village with that dogged step of theirs, which quickened when they saw the huts and the houses in front of them. They seemed about to pass the store, when one of them, shouting hoarsely, rushed to the entrance of the shop, and seized something eatable in his hands. In a moment a dozen or more followed suit, crowding round the tiny structure, seizing whatever they could lay their hands on, buffeting the protesting owner, and trampling on his poor household gods. Thirsty, ravenous, ill-disciplined creatures as they were, they had been taught to care nothing for the rights of a contemptible 'giaour'; they scrambled over one another's backs, and in a trice they had rifled the shop of almost all that it contained.

In the first moment of the excitement Alexandre cried, 'Quick, monsieur, la photographie!' and I succeeded in snapping the foremost of them as they approached the store. But the Commissary was angry, and cried to the driver to push on.

As we began to ascend the mountainous track beyond we passed more soldiers, and a mile or so off we could see the village of Giavato, the miserable ruins of which I was to visit and inspect on my return journey. The houses were roofless and destitute of inhabitants. But a few months before the Turkish soldiers had visited it, massacring all the people they could find there, pillaging and burning the houses. With many windings the track crept up the mountain.

When we reached the summit of the pass and the road took its downward curve, a new country, a new panorama, spread itself before our gaze—beneath, a broad, flat plain; beyond it another and higher range of mountains; and to the south of the plain, glimmering vast among the hills, the lovely blue expanse of Lake Prespa. The sun, high in the heavens, blazed with a yellow fire, but could not blot out the infinitely varying colours of plain, mountain, and lake.

It was one o'clock, and no time for travellers to be abroad, when we entered the little town in the midst of the plain, the now famous town of Resna. When I saw it, it had recently been the centre of a wide area of insurrection, and from it masses of Turkish troops had operated, entering the villages to the north, to the west, and to the south, outraging and killing those inhabitants who had not fled to the mountains, and burning their houses to the ground. But since then the name of Resna has been blazoned abroad in Europe, for it was here, in the summer of 1908, that that adventurous

patriot, Niazî Bey, laid his plans. Stationed at Resna as commander of the garrison, he spread the principles of the Young Turks, infecting his soldiers with his own enthusiasm, and, at the critical moment, breaking out of the town with a band of followers, made a triumphal progress from village to village. It was here, in Resna, that he gave the signal for that strange revolution.

As I saw it then it reposed in the calm of midsummer, a lovely cluster of white and dun-coloured houses, screened by acacias and poplars and fruit-trees. We drove up to a little *khan* (inn) in the narrow main street; the gendarmes dismounted and partook of the customary coffee and cigarettes. But Alexandre led me away to the outskirts of the village, into a grassy garden planted with apple and mulberry trees; and a graceful woman, thirty years old perhaps, with two pretty children, came and offered us coffee and fruit. We had not been there more than a few minutes when the Mudir arrived, the governor of the town, accompanied by a minor official. We exchanged greetings, and he expressed the ardent hope that we had had a pleasant journey, that my escort had been satisfactory, and that we should carry away agreeable recollections of Resna. I replied to him in the same vein of compliment; and when he had drunk his coffee and smoked his cigarette he departed, bowing and lifting his fez.

We threw ourselves on the grass in the shade, and consumed the food and wine which Alexandre brought. We invited the Bulgarian woman and her daughters to join us. The two young girls gladly accepted the offer; but their mother, with her white head-dress falling over her shoulders, her bare feet and ankles showing beneath her dress, stood sadly by and would eat nothing. Amongst the Bulgarians there are no distinctions of class; there are no social barriers between the poor and the rich. So there was no strain or awkwardness in the interchange of hospitality. The woman told us about her husband, who until the last year had been a rich merchant in the town. But then the insurrection came, and he was killed, and she and her daughters were left with nothing but this orchard. During the summer they had lived on fruit and the coppers which they got from selling coffee. 'That is all the Turks have left us,' she said, and her dark, melancholy eyes wore that patient, resigned expression which is so often graven on the faces of Bulgarians.

We were interrupted by a noise of sprawling feet and loud laughter which came from the road, and the figure of a dust-stained, road-weary soldier lurched amid the trees, followed by another, and another, and another. A dozen red-faced, disorderly fellows tumbled into the garden, and I recognised them as members of the company we had passed at Kazania. They spread themselves in a circle on the ground and

called loudly to the woman. She hurried to attend to them, and sought to ignore their buffoonery. The children shunk away. The men drank coffee, cups innumerable, and ate an abundance of fruit. 'What was her charge?' they asked tauntingly. Poor devils! they themselves had not received their pay for months, and they were accustomed to exact what they could from the terrified Christians. They pretended to search one another for money, and one of them, a wit, unearthed a *metallik* (about a halfpenny), and tendered it in payment for them all. At length they departed, as uproariously as they had come, leaving the frightened woman in tears.

Passing the official quarters of the Government, we walked down the main road of Resna, along the narrow alleys which pass for streets in Macedonia, on our way to the shop of a certain M. —, father of a well-known revolutionary organiser, a Bulgarian. I will not pause to describe my conversation with this modest merchant, nor will I dilate upon the entertainment I received that night at the *khan*. I did not sleep in the squalid bedroom which was put at my disposal. It was better to lie down on the balcony in the open air, with my own rugs for covering.

In the middle of the night I was aroused by Alexandre's plaintive voice: 'Oh monsieur! monsieur! I cannot sleep.'

'Don't be an ass!' I replied. 'Why don't you try the balcony?'

Reluctantly he complied, and snored placidly for the rest of the night. I always fancied that Alexandre, who did not wish to fall short of English ideals of cleanliness, was apt to assume a squeamishness that was foreign to his nature.

'No; it was decided overnight. We go on foot by the straight path over the mountains.'

'But I find the carriage is still available, monsieur. And there is a good road which follows the pass.' It was the Commissary who spoke. His soul revolted at the thought of a long, tiresome climb over a dreary mountain.

'Monsieur le Commissaire is afraid for his legs,' said Alexandre, rejoicing at the chance of attacking his enemy. 'His legs were made for sitting down.'

The Commissary ignored the remark.

'There are dangers, monsieur. The mountains are infested with brigands. For myself I do not mind. But it is my duty to protect you. We cannot pass safely without at least a company of soldiers. We shall suffer the fate of Miss Stone.'

'Well, we must risk it,' I said. 'You must try to protect me.'

But as for walking over a mountain!—no, it was not in the Commissary's nature. When we assembled in front of the *khan* an hour or so after sunset, lo! the Commissary mounted, or rather huddled up, a miserable malformation of

humanity, on the back of a mule! His red fez seemed about to join issue with his knees. He had stuck pistols about his person wherever he could find a place conspicuous enough. Alexandre pointed at him slyly. 'Look! the Government!' he whispered.

The rest of the escort was more reassuring. It consisted of four tall, strong-limbed Albanians—genial, sinewy men, accustomed to mountains, born to the use of arms and delighting in war. The seven of us passed out of the town, crossed the little bridge to the south, and in less than an hour the smooth ways of the plain were left behind, and we began the arduous ascent.

How thankful one is to that special dispensation of Providence which has provided springs on the sides of mountains! One follows a stream upwards, perpetually upwards, longing to drink; and is told, 'No; the water here is fetid. Wait a little, monsieur.' And one climbs on; and the Commissary pants harder, perched on his ignominious steed; and the sun pours down with ever-growing strength; and suddenly one comes upon a little temple of stones, whence water spouts in a glistening, crystal stream, and one drinks innumerable draughts of nectar—no spring in England ever produced water like this! On resuming the climb one admires more keenly the stalwart Albanians, who, with unfaltering, even strides, move as if they were component parts of the nature which manifests itself in a colossal aggrandisement of hillside, plain, and sky. There are no clouds; only a mass of dazzling refulgence which spends itself overhead. Great edges of mountain hang over on this side and that, and beneath one's feet the rough path winds by the side of precipices and along half-enclosed passes.

Soon the air has become rarer. The sun, now high in the heavens, smites us in vain; pleasant breezes are like balm in the nostrils; the way becomes smooth, and short, welcome trees cast graceful patterns on the turfed ground. We have reached the plateau near the summit of the mountain, and from the tropical heat of a Macedonian plain have passed into the freshness of an English spring.

But suddenly the gendarmes halt. They cluster together and draw their rifles from their shoulders. The Commissary hurries up and throws himself excitedly on the ground. Alexandre holds up one finger. '*Comitadjis*, monsieur!' he whispers. And for one tense moment every one is silent, alert, conspicuously armed. That is all. It is a false alarm, prepared, it may be, for the special confusion of the Commissary—and, alas! I am cheated of an adventure.

A few minutes more, and we are at the highest point on the route. The summit is like a meadow, dotted with trees; and on all sides there bursts upon us the full grandeur of one of the most magnificent mountain scenes in Europe. In front, a ridge of high mountains. To the

left, below, the long, winding reach of Lake Prespa, blue as the Mediterranean in spring, a vast sheet enclosed by the gaunt, gray bulk of two ranges of hills. To the right stretches before us the country we have come to see. Ochrida itself is too near to be visible, but far beyond are the black lines of mountains, the inaccessible fastnesses of the untamed Albanian tribes; and below, in the middle distance, an expanse of liquid azure, the Lake of Ochrida, the inland sea, the beauty of which is not surpassed by any lake in Europe. There is no mist rising from it to-day. It is pure, clean-cut, exact, of colour fresh and intoxicating. On all sides the mountains rise in terrifying proportions, and in the distance the lake loses itself among them.

And there we rest at midday, yet enjoying the brisk coolness of the morning. Gradually all the party unbends, as Alexandre brings out chicken, bread, and wine, and the steady-eyed Albanians, sharing our meal, look at us with the relaxed, bright faces of road companions.

It is a country of strange contrasts; of bewildering natural beauty, and filth and squalor indescribable; of generous hospitality and brutal cruelty; of scrupulously polite, decorous manners and ungovernable savage moods; of a Government always interfering, and a lawlessness which sets restraint at defiance; of vast natural resources, agricultural and mineral, and appalling poverty. On the summit of the mountain we had sat, Turk, Albanians, Bulgar, and Englishman, in friendly intercourse; before us the lovely panorama of lakes teeming with fish, the rich, alluvial plains, the partly timbered mountains, and the gaunt peaks. Truly a land of promise! But as we reached the lower limbs of the mountain we came upon a village. With difficulty I compelled the Commissary and the gendarmes to stay where they were, whilst Alexandre and I approached the poor ruins of houses, which were all that remained of the once comfortable steadying. It was the old tale. During a recent insurrection the troops had descended on the village, and had killed or outraged those who could not escape to the mountains. They had pillaged and burnt the houses, and had attacked and desecrated the church.

I found them, the survivors—chiefly women, old men, and children—desolately surveying the scene of ruin, standing just as they had stood every day of the summer, idle, ragged, and hopeless. The roofs of the houses, the partitions, furniture, and doors, had been burnt away. In a few cases they had made a meagre shelter with a rough thatch of grass and twigs spread over the charred walls. Then they had abandoned the struggle. They had no tools, no agricultural implements, no seed for sowing; and so they had no harvest, no bread, and scarcely any clothing, and had subsisted during the summer on a scanty diet of fruit and water. They stood forlorn, dazed,

stupid, gazing at the remnants of their houses, some of the women holding babies at their breasts. As I approached, a fierce mongrel of a dog flew at me, but some one hurled a brickbat at him and drove him away. They all clustered round me in piteous attitudes, pointing to their mouths, showing their scars, and murmuring in abject tones. They showed me the wrecks of houses which they had once regarded as homes, and, as a crowning horror, took me to their poor dishevelled church, and showed me where the candelabra had hung, where the silver vessels had once rested, and the blots on the walls which had once been adorned with crude frescoes. They moaned to me and entreated me to represent their unhappy fate to the Government. And then I went away—there was nothing I could do; and a low, dulled, hopeless sound went up from among them as I departed.

An hour later I was passing through the narrow main street of Ochrida, where there were soldiers, gendarmes, merchants, priests, conspirators, and spies. And the sound of splashing waves and the smell of fresh-water fish greeted me as I was taken to Monsieur N.'s house, by the lake, and was kindly received. And Alexandre went with Monsieur N. to help to prepare the guest-room; and the Commissary of Police, with many compliments and salutations, bade me good-night.

In a few years, assuredly, this road from Monastir to Ochrida will have changed. The Turkish soldiers have gone; Greeks and Bulgarians have taken their place. It may be that when next I travel that way, I shall meet, not ragged soldiers and fugitive peasants, but tourists inspecting the beauties of Lake Ochrida, directed by a neat official from Messrs Cook.

ATLANTIC GOLD.

CHAPTER XIII.

ON a night near to Christmas, Anstruther helped his friend from a train at King's Cross. Arcus looked older; he walked with a limp; but there was brightness in the voice that greeted Anstruther and in the eyes that ran over the animation of the platform.

'Good old Anstruther! Good old London!' he murmured, settling himself in the cab.

'Don't talk till we are in my rooms,' said his friend. 'You've had a tough journey, and you've risked it just soon enough.'

'Oh, I'm all right,' Arcus said. 'Now that I've got a move on at last, I'll be fit in no time.' But he fell silent, watching the whirl of the streets, and five minutes passed ere he opened his lips. It was to say 'Good old London!' again.

'Glad to hear it.' Anstruther laughed. 'You were cursing it when last we met.'

Arcus laughed also. 'What a talk we're going to have to-night! My letters have told you nothing, and—he became grave—you never answered my chief question. It wasn't meant to be impertinent, you know.'

'I know,' said Anstruther soberly. 'But you had your own troubles.'

'Answer it now, old man. How did you come through the panic? I had feared something like it all along, and I read about it in an old weekly when I was beginning to pick up. How did you come through?'

'We just came through.'

After a pause, 'I see,' said Arcus. 'Three months ago I thought I was going to be the one to show you a road to fortune. Now I can only offer you half of whatever I happen to possess. But you've got to take it. Make me a sleeping partner if you like, but for Heaven's sake don't

make me a sleepless friend! I've been thinking'—

'Thanks, Arcus; thanks a thousand times. But'—

'No "buta." You've a girl waiting for you.'

'Don't, my boy. You'll hear all about the panic later. It ended a lot of us, coming as it did on top of the Kaffir collapse and the rubber fiasco. I ought to be thankful. But let us drop it now. Funny subject for us to start with!'

'One question. Was the forgery business the real reason for the panic?'

'There is rarely a real reason for a panic. The forgery business was an excuse, perhaps. In itself there was little to justify— Ah, here we are! Welcome home, Arcus!'

Arcus refused to go to bed. He had his tale to tell. He told it, Anstruther rarely interrupting. He ended with, 'And I'm going to find her!'

'You are going to marry that man's niece?' said Anstruther gently.

'Why not?'

'Don't misunderstand me, Arcus. From what you have told me of Miss Helmsdale, I foresee difficulty. She may not consider her engagement to you binding. I mean to say, she may refuse to marry you—for *your* sake.'

'Heavens, man! what do you mean? Oh, I see! Yes, she *is* that sort of girl. But, thank God, she doesn't know what Helmsdale is! She is utterly in the dark'— He ceased, staring at his friend. 'What's the matter?' he demanded irritably.

'Is it possible?' said Anstruther slowly. 'Well, I suppose it *is* possible that you have never heard.'

'Never heard what?'

'That in New York, last week, Helmsdale was sentenced to ten years—— Hang me! I ought not to have told you.'

Arcus, pale, was gripping the arms of his chair. 'Go on!' he said hoarsely. 'Go on!'

'I can tell you only what was in the newspapers.'

'Tell it!'

This was the substance of Anstruther's story: Helmsdale's flight from Laskeir was the consequence of a false alarm given by one of his gang who had gone silly on absinthe, but Helmsdale believed in it until after his arrest. Nevertheless, on the first day of his flight—his destination had never been definitely stated—Helmsdale commanded the *Phyllis* to be put about and run for the westerly coast of Ireland. In Donegal Harbour he landed for surgical treatment an officer who had sustained a severe injury to his head. Under the hands of the doctors the officer recovered the use of brain and speech within twenty-four hours, and forthwith denounced his late employer. The *Phyllis* was taken off the coast of Newfoundland, her bunkers all but clean, making for a port—a last desperate resort—where they might be replenished. In New York Helmsdale broke down and confessed, without, however, implicating others, save the unlucky creature who had brought the false alarm.

'But Florence!' cried Arcus. 'Where is she?'

Anstruther shook his head. 'She was in New York during the proceedings last week; but——'

'When can I get a steamer to New York?'

'Hush, man! You'll make yourself ill again. Go easy.'

But Arcus would not 'go easy.' He would go in search of Florence at once; he would find her; he would marry her out of hand; he would take her away and make her forget the staring world and the man who had brought shame upon her; he would——

'I'll tell you how you might make a start,' Anstruther interrupted at last. 'There is one man in London who might know something about Miss Helmsdale's movements. He came back only yesterday—noticed it in the papers—from New York, where he had been watching the case. Jonathan Barge'——

'What! Jonathan Barge? The man I met'——

'You have met him?'

'A man of that name, anyway, in the hotel at Portree. Who is he?'

'Why, Jonathan Barge is a detective—a big man in his way. What'——

Arcus fell back in his chair. 'I see it now!' In a few words he related the incident of the visiting-card. 'That's what upset Helmsdale and his nerve. Jonathan Barge! I had for-

gotten all about him. Have you a telephone, Anstruther?'

'I have a clock! Even detectives go to bed sometimes. As for you, my friend, you are now going to yours.'

It was one in the morning, and Arcus gave in. Nay, more, he slept.

Noon next day found him in Jonathan Barge's office. He opened his heart to the detective, who, while sympathetic, appeared as a very different person from his Portree acquaintance. But few men are the same at business and on holiday.

Jonathan Barge made Arcus say all he had to say, or thought he had to say, ere making a single remark on his own account.

'Helmsdale was an artist,' he then said. 'He was an artist when, as Fitzwilliam, he slipped through my fingers ten years ago. But he has improved on himself since then. You need not say anything about his having been Fitzwilliam. There are people on the Continent who would like to know, but he has enough to account for without that. Besides, I wasn't proud of the case. Yes, he was an artist.' And the detective smiled.

Somewhat irritably Arcus replied, 'He was a pretty good business man, too. What about his fortune?'

'His fortune, Mr Arcus?'

'His accumulation of gold. By the way, who got that? Or has it not been discovered?'

Mr Barge regarded his visitor quizzingly. 'You still dream that Helmsdale was recovering Atlantic gold in Laskeir?'

'I have an ingot in my dressing-case at my friend's. I saw the process'——

'You saw a very pretty piece of artistic humbug.'

'Mr Barge, I will put that ingot in your hand, and you'——

'And I shall tell you that it is gold—not, however, Atlantic gold, as you imagine; though you are entitled to call it New Atlantic gold, if you like, seeing that it probably proceeded from the sale of forged scrip of the New Atlantic Railroad. Have a cigar?'

Arcus ignored the invitation. 'Do you mean to tell me that all his elaborate machinery was merely a blind, Mr Barge?'

'I tell you that the man was an artist. He would have welcomed a thousand strangers as he welcomed you.'

For a moment or two Arcus, feeling hot, held his peace.

'Helmsdale,' resumed the detective, 'had no fortune. His organisation for the distribution of his forgeries was costly. In the course of years the business would probably have paid him handsomely; but thus far his partners or agents, who had to live big, absorbed practically all the profits. I consider him an ill-used man,' laughed the speaker. 'Of course he made something,' he

went on; 'but his style of living on Laskair cost money; so did his laboratory, not to mention his artistic humbug.'

'But his yacht, the *Phyllis*?'

'Mortgaged to the limit. As for his inventions, he sank them in the sea before he was taken. In ten years—perhaps seven, if he is very, very good—he'll return to the world almost as poor as he first entered it.'

'My God!' muttered Arcus, 'what is to happen to his niece?'

Jonathan Barge shook his head. 'I offered my humble services over there, but she would have none of them. I can give you the address I called at; but you must not expect to find her there now that Helmsdale's fate is fixed. I can also give you a letter to a friend of mine in the police, who may be of assistance in tracing her. It was a pathetic business,' he went on, with another wag of his head, 'and I'm not easily moved. Poor thing! she wanted to prove herself his accomplice, imagining, I suppose, that she would be sent to prison along with him. Well, I wish you luck in your search, Mr Arcus. If it's not a rude question—I'm a much older man than you—have you considered what to do with the young lady after you have found her?'

Arcus flushed slightly. 'I shall marry her. We arranged all that on Laskair.'

'Oh! Another forward question: Have you reflected on how your friends may regard the marriage? A man can't easily get away from his friends, you know.'

'The past will be dead so far as they are concerned.'

'Ye-es. Seven years may see Helmsdale free. Naturally enough he will come to her—and you.'

'He has a claim on me. But for him I should not be here.'

Mr Barge nodded. 'He was not a sordid creature. He had his sentiments. But don't expect to escape awkwardness, Mr Arcus.'

'If his niece can forgive'—began Arcus, and halted. Then, 'I sail by the first boat. And now, Mr Barge, I have to'—

The detective waved away his visitor's thanks. 'Once more, good-luck to you. Let me know if I can be of use. And—pardon me again—don't take an oath just yet to be good to Helmsdale. You may regret it, or you may break it. On the other hand,' he smiled, 'you can remember that he was an artist. Artists are forgiven much nowadays. Good-bye.'

Arcus, his gratitude tinged with resentment, drove to his club. Until a week ago his letters had been forwarded to Harris, and the porter had but a thin bundle to hand to him. He turned them over. The last bore the New York post-mark over unfamiliar writing—writing, nevertheless, which he instinctively knew to be Florence's. He tore open the envelope, and drew forth a paper, blank save for the solitary word, 'Farewell.'

Next day he sailed for New York.

(Continued on page 372.)

CHILD-LIFE IN PALESTINE

'CHILDREN are the flowers of the world,' say the Arabs; and their word for family means literally 'those who are cared for.' But they wear their flowers with a difference which is marked at the very beginning of life. When a little stranger comes to an Arab home musicians are waiting round the door. If it opens, and a glad voice proclaims, 'To us a son is born!' the response comes promptly, 'If it be the will of Allah, may he be kept to you!' Then the musicians beat their drums, blow their shepherds' pipes, and pluck at their strange stringed instruments, while they chant a welcome to the newcomer, the praises of his family, and a forecast of the great deeds to be done by him. But if the stork has brought a daughter, the door is set ajar for a moment, a head is shaken silently, or a sad voice says, 'It is the will of Allah,' and the orchestra goes empty away; there is no need of music or feasting to usher in another superfluous woman.

But human nature being what it is, the undesired little girl is by no means unloved. A pretty name is chosen for her, such as Latifeh ('gracious'), Zarifeh ('pretty'), Jamtieleh ('pleasant'),

Selma or Salome ('peace'), or she becomes 'Star or Dawn, Rose or Lily, Pearl or Diamond. But if two or three girls are born in succession, these pet names give place to Tammam or Kafah, both of which mean 'enough'; or, as the irate Scotsman put it, 'We'll ha'e nae mair o' that.' Boys for the most part bear the names familiar to us in the Old Testament—Abraham, Jacob, Joseph, Isaac, Moses, &c.; though Mustapha and Hassan or Hussein are almost equally common among the Moalems. Names of animals, such as Saba (lion), Caleb (dog), Dub (bear), are often given by parents who have lost one child after another, in the hope that by this self-humiliation they may avert the evil eye or appease the demon who has made their home desolate. Children are sometimes called after a dead relative, but rarely after their father; though his name is often used as a sort of surname, as Simon, son of Jonas. On the other hand, in this topsy-turvy country a father is called after his son; Ya Abu Mustapha ('Oh Father of Mustapha'), Ya Umm Mustapha ('Oh Mother of Mustapha'), being the proper form of addressing the parents of a first-born son. This title is retained ever after, even

should Mustapha die or be only the first of a quiverful.

The new baby, whether boy or girl, is usually rubbed with salt, and has a blue bead tied round its neck, so that no evil spirit may take possession of its small body; its eyes are blackened with kohl, its arms laid straight by its sides, and it is tightly wrapped in swaddling-clothes and strapped to a pillow. For the first few weeks it is a sort of chrysalis, able to move its head only, easily carried on its mother's back or hung on the branch of a tree. As soon as he can sit up, the mother carries her little son astride on her shoulders, his tiny hands clinging to the top of her head, just as Egyptian mothers did four thousand years ago. The country people say that the habit of gripping with the knees thus early acquired is the secret of their unrivalled horsemanship. The daughter is seldom carried in this fashion; at first she may ride on her mother's hip, or be carried on her back or in the pocket made by the belting of her robe; but very soon she must learn to toddle on her own bare brown feet, and to put on what scanty raiment is thought necessary.

The peasant children in summer wear very little but their 'birthday dress'—perhaps a scrap of coloured cotton bestowed somewhere upon them, and the inevitable blue bead. In the villages—Bethlehem, for example—Christian girls wear a small copy of their mother's dress, a blue cotton robe embroidered in gay colours, a long white veil thrown back, and a head-dress of coins which suggests a premature halo; the Moslems are shrouded in black or white *mileins*, and closely veiled.

In the towns you see an infinite variety. Many natives think it advanced to dress their children 'Frangi fashion,' which means cheap ready-mades imported from France or Germany; to others it is a point of honour to keep up the traditional costume of their race or sect. You may meet any day a little fellow of six in the full uniform of a Turkish officer, his majestic bearing somewhat spoiled by the sword which will get between his fat legs and trip him up; and your next glance may fall on a boy 'vowed' from his birth, and therefore wearing the Franciscan's brown habit and the rope that goes all round.

In Jerusalem, some years ago, the Russian church on the top of the Mount of Olives boasted a 'wonder-child,' a sweet little maid of seven summers, who stood before the altar in trailing black garments, and led the devotions of the Sisters in a silvery treble. Attempts to make her acquaintance were foiled by the lack of a common language and by the extraordinary dignity of her curtsy, to which we could make no adequate response. But a timid offering of chocolate was accepted with reassuring alacrity; for in Palestine, as elsewhere, the red lane leads straight to the heart of a child. So one sees

in the bazaars, where Turkish officer, little St Francis, Jew boy in overcoat and yellow ringlets, woolly-haired Soudanese, and Arab, brown and impudent as a sparrow, all come flocking to the call of a seller of sweets. 'Sweeten your teeth, oh boy! This is *halawi* from Damascus. Call your mother, oh boy!' 'Maiden's Spinning!' (a sweetmeat drawn out in long silky threads). 'Oh Maiden's Spinning! 'Tis given for naught!' 'Ice cream! Ice cream! Oh the selling for one metallic!' (halfpenny). 'And with Allah be the binding up'—that is, the recompense for selling so cheap. Most alluring of all, a cock made of pink candy is advertised with a wailing cry, 'Allah is everlasting!' and never fails to attract purchasers.

Here, as always, children's play is mostly 'making-believe' that they are grown-up. You may see a mite of five or six paying a visit of ceremony to a pasha of equally tender years, exchanging such compliments with him as 'Rest, I pray you!' 'Nay, he who sees you is rested!' and finally backing out of his presence, while he gathers up handfuls of dust and sprinkles it on his head. Holding a law-court, with melon-seeds to represent the bribes, is a popular game, and so is a raid of fierce men from the desert. The selling of Joseph and his subsequent interviews with his brethren are rendered with much dramatic action; also the afflictions of the man of Uz, with new details, such as Job's wife cutting off her hair and selling it for bread. Church processions are reproduced, especially at Easter-tide, and marriages and funerals are as frequent now as they evidently were when Christ likened the Pharisees to sulky children who would play at neither. 'Doing bride' is naturally the chief amusement of the Moslem girl, as it is the one great event of her later life. This is not a speaking part; for the truly modest Eastern bride should give no sign of life, but should sit for hours without an eyelash flickering while her maidens deck her with ornaments and sing songs in her praise.

Such are the games of the town-bred children. In the country they build houses and set up miniature tents like their own homes. It was strange and touching to find tiny, flat-roofed houses between two great pillars in one of the ruined cities beyond Jordan; the child-builders of centuries ago had made for themselves a monument no less enduring than their elders' dreams in marble. But the country children have little time to play, for at an incredibly early age the boys begin to lead out the animals to pasture, and the girls to carry wood, fetch water, gather and dry fruit, and make dung-cakes for fuel. It seems hard work for the little folk, but it has its compensations. An Arab boy guiding the 'hairy-scairy camuel,' which could kill him by the simple process of stepping on him, is as proud as a pasha; and a girl tastes joy when she first carries her water-jar on her

head without holding it, and hears her mother say, 'Herb of my heart, thou art clever! A star shalt thou be in the house of thy husband.'

The town children, too, if their parents are poor, are early set to work, and you see them in the Damascus bazaars blowing the bellows for the smith or learning to punch the background of the brass bowls so dear to the heart of the tourist.

In Palestine there is no Children Act and no compulsory education. The children of the tents and the mud-villages grow up as best they can, much loved indeed, but no more trained than the tiny black kids that gambol with them on the stony hillsides. If they are Moslems they may go occasionally to a little school, where they sit cross-legged chanting selections from the Koran, and learning to form Arabic characters on the sand-strewn floor. Jews are taught in much the same way, only the Talmud is substituted for the Koran, and they learn by heart many thanksgivings, the first of which is, 'We thank Thee, Almighty One, that Thou hast created us men, and not women.' The little Moslem does not reckon up his mercies in this way; but he is carefully instructed that there are six things never to be mentioned without a preliminary 'By your leave.' These are a Jew, a Christian, a dog, a pig, a woman, and his boots. Such is elementary education in the country districts.

But in the towns, especially in Jerusalem, you find all the higher branches—nature lessons, typewriting, Esperanto, even Shakespeare and the use of the globes. The clashing of new ideas with age-long prejudices gives some strange results. For instance, the head of a mission school in Damascus began lately to give physical exercises and drill to her girls, who learned with surprising quickness and enjoyment. On the third day the most zealous of the little pupils was absent. The teacher went to inquire for her, and was met by a tearful mother. Zartfeh could never come back to the school, for an evil spirit had entered into her, and made her toss her arms and legs unceasingly, and mutter strange words. The holy man of the mosque said she was assuredly possessed, and had given her a charm, but it was all in vain. 'Behold the afflicted one!' and she pointed a trembling finger to the flat roof, where the 'afflicted one' was practising arm and leg exercises, and counting 'One, two, three, four.'

Droll, too, was our first visit to a Turkish official. We went, eager for a glimpse of a real Eastern interior; but, alas! the *Illustrated London News* lay on the divan, the tea was à l'Anglaise and undrinkable, and the four children of our host, in faultless sailor suits and the stiffest of white muslins, were perched on very high cane chairs, their poor little feet, in French shoes, dangling forlornly. For our entertainment they stood in a row, and read sentence about from *Black Beauty*, and the younger daughter

recited 'A Helpless Orphan's Tale.' Proud were the father's glance and his query, 'Is she not an English miss?' when his little Fatima dug a chubby forefinger into her dimpled cheek, repeating all in a breath, 'Tis-want-that-makes-my-cheek-so-pale.' The mother of the family did furnish some local colour, for she spoke Turkish only, her Oriental silks and gauzes gleamed with jewels, and her nails were pink with henna; but her dark eyes were troubled as she watched the little daughter whose world was other than her own. No doubt she was wondering whether any good Moslem would ever marry a maiden who walked abroad unveiled, and knew more than was fitting for a woman.

Even the schools attached to the Greek and Latin monasteries are adopting British methods; and you meet a priest in his black *soutane* leading out his boys in black surplices and red sashes to play 'the cricket.'

For girls in the East childhood is very brief. Betrothed often in infancy, they are married at thirteen or fourteen, and the daily round furnishes much more—of toil, at least—than any of us Westerners would ask. A few of them now aspire to careers as teachers or sick-nurses; but, on the whole, 'living one's own life' is too new an ideal to find favour in their eyes.

Boys, on the other hand, are wakening up to the fact that knowledge is the key that opens many gates. They crowd into mission schools, and pick up learning's crumbs with a quickness which is astonishing and delusive; for this facility in acquiring information is not often accompanied by the power to reproduce it accurately or to reflect upon it, while it does bring with it the pleasant conviction that 'What I don't know isn't knowledge.' These characteristics were very obvious in some essays which it was our privilege to read. Here are a few examples:

'It is a superstition that if some one sees something eatenable, and does not have it, he will die; but we who are well educated, of course, we believe not this.'

'The people of Spain refused to name their King Alfonso, because he would then be called Alfonso XII., which signifies Barnabas the traitor. And Alfonso XIII. was nearly going to be killed on the day of his marriage, the ignorant say because he was thirteen.'

'Superstitions of fear were believed by the ancient people who were as children if they are compared to people of our days. But we cannot blame the people of the older time for having undeveloped brains.'

Comment is superfluous. As a rest from this 'heir of all the ages,' let us quote a Moslem boy's description of the prodigal and the miser as he has seen them:

'Most of the prodigals inherit their fathers.

When a man inherits his father he knows not how the money come, he puts his hand in his pocket, take out, and spend on nothing without to look at it. The prodigal is familiar [similar?] to a desert; he take in, but produce nothing. But one must say the prodigal has many friends. He eat and drink with a kingly zest, he laughs and is merry. You will see that he consorts mostly with street men, fearing the converse of upper men lest they reprove his evil manners. When all his money is spent on picnics he goes far away, becomes a shepherd of pig, and eats only fruit of the *ikharub* tree. The money wasted, foolish, obtaining nothing, you see his friends are running away from him. Even if he asks

help they will not help him, but send him away, scolding him.

'It is very difficult to get hold of a miser's idea or from what use he work so hard to get money and imprison it in his pocket. A miser is a mizary-producer to others. His children and wife hate him, and they may kill him to inherit him. He is thrown out of every man's eyes, and as a dog in a corner. He is selfish, dishonest, and lyar man, who save all hordings, putting his money in a box and taking a glance at them every day as if they were holy. Does he not know that he is immortal, and that some day he must be departed from his money, which at last go to lawyers and governors!'

THE VINDICATION OF PATON.

CHAPTER III.

A YEAR had passed—a year in which many things had happened. Affairs were reaching a crisis in Egypt. The administration was at fault, and those in Alexandria and Cairo knew it. Petty fights in the bazaars, the drawing of knives in the streets, all pointed one way. The Egyptian elbowed the Briton off the path, and blows resulted. Once even the flag upon the Government House had been torn down, by whose hands no one knew; but the act added fuel to the fire which day by day was increasing in the Nationalist party.

Much also had happened in those twelve months to Paton. On the introduction of Mr Bellamore he had obtained the post of manager to a large English firm. His friends increased as the weeks went by, and little by little the acuteness of the shame that was his had been lifted from his soul. By every mail almost there came a letter from Brentwaite, telling of unceasing efforts, and apologising for the failure which so far had attended them.

When Paton came down to breakfast one morning—it was the end of June—he glanced through the letters by his plate. Eagerly he tore open one envelope as he saw the writing. Inside was a slip of paper, and on it the words: 'The first anniversary. Good-luck, dear!—KERRY.' That was all. He bent down and touched the sheet with his lips.

At Mr Bellamore's request he lived with him, helping him to keep alive the bachelor house, as the elder man had put it with a wry smile.

A few minutes later Mr Bellamore entered the room. 'I did not see you last night,' he said. 'I heard some news. First, there was a bad fight at the Mahdi Bazaar. Nine Egyptians were killed, and one Englishman. I do not know for certain, but they say it is little Gregory.'

Paton nodded gravely. He was not surprised.

Few men were. 'I am glad I learned to use a rifle, also a sword,' he said.

'Secondly, Colonel Lavenon is here, with his daughter.'

Paton looked up quickly. An envelope which was in his hand fluttered to the ground. 'The devil!' he ejaculated. 'For what purpose?'

'I can understand the colonel's coming. Troops are pouring in fast. But why should he bring his daughter? To my mind it is the act of a madman.'

They breakfast early or late in Alexandria. The heavy gong of the clock in his dining-room struck six as Mr Bellamore laid down his empty cup.

'You are going straight to the office!' he said.

Paton nodded. 'Yes. Extra drill has been ordered at five o'clock this afternoon, and I want to get some rest first.'

His buggy was drawn up outside; the man, waiting, saluted gravely. Even then his thoughts were wandering to the speech he had heard on the previous night—a speech in which a more or less notorious Nationalist had dwelt upon the day when the British should be driven out of the streets of Cairo and Alexandria, and Egypt be a free country once more.

Paton was buried deep in thought as his 'boy' whirled him through the traffic of Alexandria to his office at the far end of the town.

Dashing down the main street, he heard a voice address him. 'Hallo, Paton!' it said.

He looked up. The man he had known in England as Charles Graham was driving in a buggy alongside his own.

For a few hundred yards they kept pace; then Paton's 'boy,' who possessed a reputation in Alexandria for speed, drew rapidly in front.

'I shall see you at drill this afternoon?' said Standish.

'Yes,' replied Paton. As he spoke his mind was full of the one thought. Why had Colonel Lavenon brought his daughter to Egypt? As Mr Bellamore had said, it savoured of the act of a madman.

Paton's business took him out of Alexandria, right into the vilâyet that skirt the great desert, which the Tuaregs still consider their own inalienable land. He had to go there that morning to inspect some camels. He rode alone.

Business transacted, he was slowly cantering back. The sun was hot, and he wished to spare his horse. Ahead the sand gleamed like a sea of molten brass. He drew his hat low down over his eyes to shut out the glare. In the distance, looking scarcely more than a mile, though a good three leagues away, showed the white roofs of Alexandria.

Suddenly his attention was attracted to a speck in the desert. He took out his glasses and studied it closely. It was a caravan riding off the beaten track. That alone gave him warning. Men who travel the desert upon legitimate business choose the beaten track, which has served for centuries. Around the caravan rode a score of men, Arabs they appeared to be at that distance, fully armed.

Paton raised his eyebrows. 'Ah!' he said.

Then he dropped from his horse and halted in the shelter of a cluster of palms. Prudence and a sure knowledge of Egyptian affairs told him the wisdom of the course. Travelling level with him were a party of men smuggling guns into Alexandria!

He watched them out of sight, then remounted and galloped towards the city. He had ridden eight miles. The caravan had vanished, disappearing into some shelter to await nightfall, when they might safely enter Alexandria.

Along the road they had ridden he saw a horseman galloping swiftly in the same direction as himself. First Paton thought he was pursued. But there came no following cloud upon the horizon. Then he realized that the horseman must have either overtaken or been overtaken by the party on camels, and he had come away scathless!

Nearing the city Paton rode along a converging path, one which brought him nearer to the solitary horseman. They were just outside the gates when he made the discovery.

'Standish!' he muttered.

He went through the morning's business with a mind which wandered from his work. First Colonel Lavenon and Kitty, and then the lonely horseman he had seen. It was a day of surprises. He drove home to hear the sounds of firing in a distant quarter of Alexandria. The British policemen had stopped a speaker who was preaching sedition to a crowd numbering about a thousand gathered at one of the native bazaars.

The speaker was a young Egyptian full of the

doctrines he disseminated; moreover, he was a favourite with the natives. Few men are not who preach a doctrine which has the upheaval of law and order for its theme. There had been a riot. The police had been jostled, one even thrown from his horse. Stones had been thrown. Then a revolver-shot was fired by one of the white-robed figures. The police were only a hundred strong, but they fought bravely, though ineffectually, until the military arrived. Then in a few moments the crowd had dispersed; but a score or more of white-robed figures lay still upon the ground in the sunlight, and amidst them the figures of a couple of policemen.

'Ah!' said Lieutenant Taylor, who commanded the relief force, 'this is the beginning.' He was young, but he was wise in his youth.

Paton reached home to find that the mail had arrived. Amongst others was a letter from Brentwaite. He had come upon a clue. Amongst a litter in an attic he had discovered a letter, unsigned, with no address, making an appointment with the murdered man upon the day of his murder. Moreover, the letter spoke of a loan of five thousand pounds, one which had never been repaid, even in part. 'When we find the man who wrote the letter we shall have done much to clear your name,' he wrote. 'The discovery has filled me with new energy, new hope. Do you know of any one to whom your uncle would have been likely to lend money? Think of any one you can, even the most unlikely person.'

Paton lay down and rested through the hot hours. Then, as it grew cooler, he took a cold bath, dressed himself for the parade, and rode down to the barracks.

One of the first men he met there was Roger Standish, full of the news which was passing from mouth to mouth. Some one was slipping guns into Alexandria across the desert, and that some one an Englishman! There were half-a-dozen men present, and they were loud in their denunciation of the man who could sell his country in such a manner.

'He must be caught,' said one, 'and there can only be one end—a brick wall and a firing-party.'

'Yes,' assented Paton, 'that is the only end.' His eyes wandered to Standish as he spoke; not that he associated the man with the crime, much as he disliked him, but he was wondering in his mind what the young officer, who now sat so comfortably sipping a glass of whisky-and-soda, had been doing out in the desert that morning, and how he had managed to evade the convoy, all so obviously armed against inspection.

Paton waited until they were alone; then he turned to Standish. 'It is strange,' he said. 'I was riding across the desert to-day, when I came across a convoy galloping along a new track by the wells of Mizah.'

Standish drew the cigarette from between his lips. 'Ah!' he said, 'evidently a party bringing

in arms. They will wait until nightfall. What did you do?'

'Nothing,' replied Paton. 'One man is not much use against a hundred with such work on hand. The strange part is, eight miles nearer in I saw a European riding along the same track. He must have passed the convoy.'

If Standish experienced any surprise, any sense of fear, he gave no sign.

'The Englishman, depend upon it,' he said. 'Did you challenge him?'

Paton regarded him closely. 'I had nothing to go upon,' he replied slowly; 'but I should know him again. Poor devil!'

Standish laughed. 'Very charitable; but your duty, putting two and two together, was to have shot him. I should have done so if I had been in your place.'

'You would have done so in my place?' Paton looked at him closely. Other words rose to his lips, but he checked them.

'I never get a chance like that,' said Standish, rising; 'it is never my luck to leave Alexandria. I haven't been in the desert for nearly six months.'

Paton looked at him again, and Standish, meeting his eye, regarded him unflinchingly.

'Some of you fellows get all the luck, you know.'

The bugle sounded as he spoke, and the two men went separately to the barrack square.

That it was Standish he had seen that morning Paton had no doubt. 'I wonder why he lied to me,' he said to himself as he took up his position.

CHAPTER IV.

A COUPLE of hours later Paton was standing before the commanding officer. Colonel Tewkesbury was a man who knew his Egypt well. He also knew the world and the ways of men. He listened to Paton's tale in silence.

'You saw them by the wells of Mizah,' he said; 'and, eight miles nearer, the solitary horseman?'

'Yes,' replied Paton.

'Then they will attempt to bring in the guns under cover of nightfall. I will have them seized. There is just a chance also, a chance in a thousand, that we shall take the Englishman.' He shrugged his shoulders. 'I doubt, though, if it is even a chance in a thousand, unless he is a fool.'

It was while riding back to Mr Bellamore's house that Paton ran across Kitty Lavenon. She was riding in a buggy. Instantly she stopped it upon seeing him.

'Dick!' she said. There was an unasked question in her tone.

'Yes,' he replied, 'I heard you had come out with your father.'

'He wanted me to. He has a lot of property here, you know, and if there is to be trouble

it might ruin him. And how are you? I do not like to ask you here the thousand and one questions I want to, dear. You must come round and see us.'

'Not until my name is cleared,' replied Paton. 'But I am a happy, proud man to-day.'

She looked puzzled.

'This morning I got your note.'

She blushed and smiled, the happy, gentle smile of a woman who loves truly. 'I told you I should send it. I shall send one every year until'—

'Until?'

'Until your name is cleared,' she said softly.

On reaching Mr Bellamore's house he found the old gentleman greatly excited. Like Colonel Lavenon, he too possessed property in Alexandria. 'And there's going to be an infernal row,' he observed gleefully. 'I only wish I were young again like you.' He glanced at the figure before him with pride in his eye. He looked upon Paton as a son—a son who had been given to him in old age, as he remarked whimsically to a friend.

Paton laughed. 'Come and fight with me. We shall be called out in a few hours, and I'll bet you'd fight as well as any of us.'

Two days later there came another letter from Brentwaite. There was much news in it—news that was good, yet which gave Paton a shock, and which shattered his belief in mankind to a large extent.

'You have heard of the firm of Anthony and Co., money-lenders? Your uncle was that firm. He was Anthony & Co., though no one ever knew it save the one man who made the appointment upon the night of his murder.'

Paton knew the firm of Anthony & Co.; there were few men moving in a certain set in London who did not. 'The Jew,' 'Shylock,' 'Blood-sucker,' were a few of the least offensive names he had heard hurled at the head of his uncle, a man whom he had always looked upon as the incarnation of honest, straightforward, gentle manhood, a man whose name figured large in every charity list.

More than one man getting into the hands of Anthony & Co. had played the game as long as possible, floundering deeper into the mire every day, finally killing themselves rather than face the disgrace. As he read the words there came to him the memory of an old college friend, and the words he had used the last time they met: 'It's worse than the devil, Dick. For the past two years I've been in the hands of that old Anthony; now I'm going to cut it. The game's up.' A year later he had shot himself.

'My God!' said Paton. He forced himself to continue the letter.

'In a few days now,' wrote Brentwaite, 'we hope to have our hands upon the man who wrote that note.'

Paton stood irresolute. For a few moments

he was tempted to telegraph to Brentwaite telling him to stop all further action. 'The poor chap has suffered enough,' he said to himself. Then he thought of his own name, and the girl who was waiting until he had cleared it. The decision was temporarily taken out of his hands.

Mr Bellamore entered the room hurriedly. 'An orderly has come for you,' he said. 'The regiment is to mobilise at once. Trouble has broken out all over Alexandria.'

Paton was still in his regimentals. He thrust the letter into the pocket of his jacket and rushed out of the room. Five minutes later he was galloping to the barracks.

There was quietness in Alexandria save for the sound of firing in a distant quarter. The streets were strangely deserted; except for a few Britons hurrying by, with set, determined faces, they were empty. The buggies had vanished. At the British Club a crowd of faces clustered at one of the windows. They raised a cheer as Paton sped by. His way led him past the house where the Lavenons lived. He glanced up. The sun-blinds were drawn; the house appeared deserted. For a moment he thought of stopping, then continued; he would come back later and warn them when he knew how dangerous the situation was. For the present he was wanted at the barracks.

He arrived to find the regiment ready, waiting orders to march out to various parts of the city.

The commanding colonel greeted him with a curt nod. 'Lieutenant Paton,' he said, 'you are to take D Company and guard the neighbourhood of the Mahdi Bazaar.'

It was a compliment which Paton did not fully appreciate until later. The Mahdi Bazaar was in the centre of the Arab quarter, a hotbed of insurrection. It was largely composed of a network of narrow streets which converged upon the bazaar, one of the finest in Alexandria. Forty-eight hours later it was known as the worst death-trap in the city.

Colonel Tewkesbury drew him aside for a few moments. 'You will find a couple of hundred mounted police there,' he said; 'you are to act in conjunction with them. You, as military officer, will be in supreme command.' He shook hands. 'I do not envy you your task; but I think you will succeed. That is why I have chosen you.'

Paton paused for a moment. There was a question he wished to ask. 'You were able to capture that convoy of guns the night before last!'

'Yes,' replied Colonel Tewkesbury.

'And the Englishman?'

'We did not capture him.'

Paton mounted his horse, and led his men out of the barrack-gate. He took them at a smart canter through the streets to where in the distance lay the Mahdi Bazaar. The sound of shots and fierce cries guided him to it. Figures

upon the roofs of the houses waved to them as they marched by. The sound of British cheers still rang in their ears when they reached the neighbourhood of the bazaar. There they saw a scene which, but for its gravity, would have charmed any eye. A crowd five thousand strong, shouting and gesticulating, stood before it. Egyptian and Arabic dirges rose and filled the air. In the distance, separated by a third of the crowd, Paton saw Inspector Collier, at the head of his handful of men, vainly endeavouring to keep order. Stones were rained upon them, and pistol-shots.

Paton gave the order to charge, and with drawn swords the company galloped down upon the crowd.

'The military! The military!' shouted the natives. For a moment there was a wavering. Using the flats of their swords, by Paton's instructions, the men charged their way to the side of Inspector Collier and his force.

'Thank God you have come!' said the inspector. 'We are hopelessly outnumbered.'

Paton nodded. 'Fall in behind,' he commanded. 'We must get to more open ground than this.'

The crowd had collected again, reinforced by hundreds who poured in from the side-streets.

Paton wheeled his horse round and led the way back. A solid human mass stood shoulder to shoulder and barred the way. From the rear came volley upon volley of stones, falling like hail upon the forces—sharp, jagged stones which could cut one's face open to the bone. From those nearest, shots were fired almost in the faces of the troops. It was a terrible moment. Paton could see men falling each second from their horses. An Arab had knocked his helmet off with a thick stick, and almost rendered him senseless with the blow.

There was a few feet of open ground around them.

'Charge!' shouted Paton.

There was a terrific impact as the horses met the solid mass of men. Then steadily, inch by inch, they fought their way to the open ground beyond. From the roofs of the houses around, those hidden there kept up a sharp rifle fusillade, killing friend and foe alike indiscriminately. The Egyptians are brave men and strong; they live in a land where only the fittest can survive, but the wall of steel that met them was too much. Bearing one another against the wall, they made way for the body of troops, pouring maledictions upon their heads; while many of them vanished down the side-streets.

Once through and in the open ground beyond, Paton turned to Inspector Collier. 'We shall have to ride back and clear these streets. Then the bazaar.'

Inspector Collier nodded. He felt a growing respect for this young Englishman. There are men who arouse this respect at sight, and when

by their actions they are further able to claim it their path is made fairly easy in this world.

Hatless and bleeding, many of them, Paton gathered his company together again. Of the crowd, 50 per cent. had dispersed, a large number lay still and silent upon the ground, white-robed figures which bore testimony to the power of the soldiers. The others were disheartened. The stones were less frequent in their showers, the aim erratic, while the cries had diminished in volume and truculence. It is disheartening work shouting maledictions at men who care little for your curses, and with cold steel for ever flashing in front of your face. At the second charge the crowd wavered, then, as the swords played amongst them, broke and ran in all directions. The insurrection at the Mahdi Bazaar was over, save for the bazaar itself.

Dismounting, and taking fifty troopers with him, Paton entered the long, low, and narrow building, leaving the other men in the charge of Inspector Collier to keep guard outside.

At first resistance met them. A couple of hundred Egyptians had sought security amidst

the stalls on each side. Like their brethren outside, they wavered, then sped out at the far end for safety, like rabbits out of a warren.

The Mahdi Bazaar is a grand sight. It is perhaps the richest in Alexandria; the choicest work of the East hangs on all sides. It was a sight which would have aroused respect in Paton upon most occasions; but the wrath of the soldier was in his blood; it tingled madly through his veins. To him the beauty was nothing.

Into each of the stalls he walked in turn, a couple of troopers at his heels, peering into every corner.

At last he came upon one, the stall of Mohammed Saki, a dealer in cloth. Mohammed Saki was an honoured man in Alexandria; the Egyptian population decked their wives with the goods that came from his few square feet of stall, while Europeans and Americans paid fabulous prices for fancy cloths which he imported specially from Birmingham for their delectation.

(Continued on page 377.)

CANE-SUGAR MANUFACTURE.

By F. T. SCARD, F.I.C.

IT is probable that few readers of *Chambers's Journal* are aware, or in any way realise, what an elaborate and costly process is required for the manufacture of cane sugar for consumption, or even for the preparation of the raw products. The impression which still pervades the minds of the general public is that the cane is squeezed and the juice boiled in a simple operation requiring neither machinery nor labour to any extent.

In early days this may have been so; but competition now renders it necessary to extract, in the very best condition, the whole of the sugar from the cane, with consequent elaboration of mechanical and chemical processes.

What is a sugar-cane? Nothing more nor less than a big grass. Everybody has an idea of what the bamboo is like. Imagine, therefore, a bamboo of about one and a half inches in diameter and ten to fourteen feet in length, with knots—or nodes, as they are termed—four or five inches apart; but having, instead of a thick rind hollow in the centre, a thin, brightly coloured, hard rind, yellow, green, purple, or striped according to the variety, the interior occupied with pith, the cells of which contain the juice; and there is a sugar-cane.

When the cane reaches maturity it flowers, sending up a waving plume, blue-gray in colour, after the manner of pampas grass. The cane is now ripe, and contains its maximum amount of sugar. The reaping season having arrived, the cutting is done by hand, this being obligatory on account of the habit which the ripe cane

has of sprawling over the ground. The reapers—negroes, East Indians, Malays, whites (men and women)—armed with a kind of cutlass, enter the fields and hack down the canes with a single stroke. Prior to this the cane has been stripped of its leaves, with the exception of those at the extreme tip, and its upper portion is trimmed off. As sugar-cane cannot be grown from seed on account of the time taken for growth, the uncertainty of germination, and also the tendency which seed-grown canes have of exhibiting varying types of character, the upper part of each trimmed cane is used as a cutting for a succeeding crop, the young canes springing from the eyes situated at each node or knot.

The next operation is to transport the canes to the factory, where the juice is transformed into sugar. In large factories this is a formidable task, two thousand tons of cane being sometimes treated in a day. The cane-fields are therefore, in these cases, connected with the factory by rail, a system of fifty miles or so in length being frequently required, steam being used for haulage. In some low-lying countries, such as British Guiana and the Straits Settlements, canals are used to carry the canes to the mills, while even water in aqueducts is employed in some instances to bring down bundles of canes from a higher level.

The canes having now arrived at the factory, the trucks, punts, or carts are drawn up, waiting to be unloaded in turn. Labourers spring upon the canes and quickly and deftly remove them

—for no time must be lost—so that the mill may be regularly supplied; or the work of unloading and transfer to the mills may be taken up by brakes or grabs worked mechanically. The canes are thrown on an endless band somewhat like a moving staircase, which carries a continuous stream of canes into the jaws of the mills in a tumbling, irregular cascade.

This done, the most impressive part of the whole process of sugar-making is now carried out. The mills consist of massive iron rolls from six to seven feet in length by three in diameter, driven by powerful engines, whose power is transmitted by large toothed wheels and pinions, the whole giving an impression of irresistible strength apparently out of all proportion to the work to be done. The mill-rolls, which in modern plants may be eleven to fourteen in number, seize the stream of canes and grind them until the refuse—megass or bagasse—emerges in a pulverised condition, water being sprinkled over the mass in the course of crushing to facilitate the extraction of the juice. In this operation the power needed is great, a factory grinding one hundred tons of cane per hour requiring in this department as much power as a fifteen hundred ton steamer.

The canes having been crushed, the juice—a dirty, greenish-yellow, turbid, foaming liquid—is collected in cisterns as it flows from the mill. This juice represents over 90 per cent. of the sugar of the cane, and requires much treatment before it can be made to yield up its sugar in the form of crystals. The refuse—the megass or bagasse—is carried away to the boilers, where, burnt in specially constructed furnaces, it supplies enough, or nearly enough, steam to give the power required by the factory.

The first step in the process of sugar-making proper is to purify the juice as much as possible, and thus prepare it for concentration and crystallisation. Milk of lime is mixed with it in large cisterns, and in some cases the gaseous products of burning sulphur are also pumped in. To complete this stage of the process heat is required, and to provide this the juice is passed through cylindrical vessels fitted with longitudinal tubes heated by steam; and as the juice is pumped through these vessels it is gradually raised to the boiling-point. From the juice-heaters the limed, sulphurised, and heated juice is delivered into settling-tanks, where it remains for from one to two hours. Here the impurities sink to the bottom, and a clear, greenish liquid remains, which is ready for the subsequent process of concentration and crystallisation. After the clear upper liquid has been drawn off, the lower layer containing the separated impurities is transferred to other vessels and resubsidised, the clear liquor thus obtained being added to the liquid first drawn off. The impurities thus collected still contain much sugar, and to recover this the thick mud is

forced through presses consisting of iron frames over which coarse cloth is stretched, the whole being held lightly together so as to form a series of compartments. The mud is pumped into alternate compartments, and as one set fills up with the solid matter the clear juice escapes through the cloth into the others, from which it is drawn off.

The cane-juice has now been cleaned and separated as far as possible from its impurities; but before any attempt can be made to separate the sugar from the juice it has to be concentrated to syrup. This means that upwards of 75 per cent. of its bulk has to be boiled off. To do this in the ordinary way would mean that the equivalent of nearly a ton of coal would be required, and the refuse of the cane would not be nearly sufficient for the sugar-making process. But by an ingenious application of the principle that the boiling-point of water varies with the air-pressure to which it is subjected, an apparatus is used which consists of three or four vessels joined together, the last one being connected with an air-pump to produce a vacuum. In this apparatus steam is admitted to the heating chamber of the first vessel, and the vapour from it is used to boil the juice in the second by reason of the lower boiling-point induced by the vacuum in the last vessel; the vapour from the second vessel boils the juice in the third, and so on, the steam being thus, as it were, used three times over.

The juice has now been concentrated to a brownish-green syrup, and is ready for the crystallising process. This is carried out in what are known as vacuum-pans, in which a low boiling temperature is maintained by means of an air-pump, as in the last vessel of the concentrating apparatus. It may be pointed out that the low boiling temperature is of the greatest advantage in the process, inasmuch as the high temperature at which the concentrated syrup boils in the open is destructive of sugar and against the formation of crystals. This can be seen by comparison of the old muscovado or moist, soft sugar with modern crystals.

A vacuum-pan is an upright cylindrical vessel with dome-shaped top, from which a large pipe connects the body of the vessel with a condenser, from which connections lead to the air-pump. The bottom of the pan is cone-shaped, with a valve-door at the lower point to permit of the easier discharge of the solid contents. In the lower part of the body of the pan and in the cone-shaped bottom are coils which are charged with steam when the pan is working. The thick syrup is drawn into the pan at the outset in considerable quantity, and boiled down until fine crystals begin to appear. This stage of the process is very carefully watched, the operator testing the condition of the contents of the pan from time to time by introducing, through a special nozzle, a 'proof-stick' so contrived that

a sample of the juice can be drawn without disturbing the vacuum. The syrup is carefully added in small quantities as soon as the crystals appear. In this way no fresh formation of crystals takes place; but as the boiling goes on the sugar from the moving syrup is deposited on the original crystals, which grow proportionately in size. The vacuum-pan is thus gradually filled with a mixture of crystals and 'mother liquor'; the latter, when separated from the crystals, being known as molasses.

The next step in the process of sugar-making is to separate the crystals from the molasses, and this quick and beautiful operation is done by means of centrifugal force. The machine for this purpose, measuring from two and a half to four feet in diameter and two to three feet in depth, consists of a cylinder with closed bottom and finely perforated sides, suspended by a spindle in such a manner that the cylinder or basket can be made to revolve at a speed of from eight to twelve hundred revolutions per minute, according to the diameter of the cylinder. The mixture of crystals and molasses is run into the basket until it is about half-full, and the machine is set in motion. The mixture is thrown against the side of the basket as the machine revolves, and the molasses forced through the perforations; while the crystals, being unable to pass through, are left in the form of a layer against the walls of the basket. If necessary—should all the molasses not pass readily from the sugar, or if a special quality of sugar is required—water is poured against the wall of sugar to assist in the operation, or even steam is applied. This part of the process occupies only a few minutes, and when it is concluded the bottom of the basket is opened and the contents discharged into a carrier running beneath the machine which conveys the sugar to the store. The molasses, which impinges on a fixed casing a few inches from the basket of the machine, is caught in a gutter and pumped up to receptacles for further treatment.

The molasses thus obtained still contains a large quantity of sugar which can be recovered, and in order to obtain this it is subjected to further concentration in the vacuum-pan. There are various methods by which this operation is conducted to produce a second-grade sugar. But in recent years the process has been considerably modified, the aim being to make, if possible, only one grade of sugar, and that the highest. To secure this result vessels called crystallisers—large, horizontal, cylindrical tanks fitted with slowly revolving arms—have been introduced. The usual process adopted is to take a certain amount of pure syrup and form 'grain' or crystals in the pan, as in the first stage of the syrup sugar, and then, instead of adding more syrup, to add molasses. The mass is then run out into the crystalliser, the arms keeping the mass in motion. The combined motion and cooling cause a separa-

tion of the sugar, which is deposited on the crystals already formed. In from three to four days the mass is ready for treatment in the centrifugals, and a sugar obtained which admits of being mixed with the finest product.

The foregoing details give an outline of the processes generally adopted in modern cane-sugar factories for the manufacture of high-class sugar. Three principal varieties of cane sugar produced by modern factories are in the market. One which is manufactured solely for refining purposes, brownish-gray in colour, contains over 96 per cent. of pure sugar. The other two are for direct consumption—white crystals and 'Demerara' yellow sugar. These require modifications of the processes described above. The peculiarities of yellow sugar are produced by the judicious use of chemicals with juice of a certain quality. In the manufacture of white sugar, sulphurous acid is also employed as a bleaching agent, and modifications of the machinery and the processes are required. In the main, however, the principles of manufacture are the same.

In a few countries, notably India, the process is still carried on as it was centuries ago by the ryots or peasantry, who employ small mills in many cases constructed of wood and driven by oxen. The juice from these mills is boiled down in iron pots, in which it is clarified, and when the syrup is concentrated it is poured into jars, where it solidifies. From the process still in vogue in India the magnificent system of modern sugar-making factories has been evolved.

In recent years cane sugar, once threatened with only second place after beet, has once more resumed its premier position. This is due to the Brussels Convention (which had the effect of stopping the indiscriminate dumping of highly bountied sugar in Great Britain and elsewhere), to the great improvement of the machinery and consequent cheapening of cane-sugar production, and to the fiscal policy of certain countries, notably the United States. It may be taken that under natural conditions beet sugar cannot compete with cane as regards cost of production.

IN JUNE.

PINK roses, lovely on their thorny stalks,
And making all the summer hedges sweet;
White roses, blowing in the garden walks,
To scatter fragrant snow about our feet;
Red roses, from whose dewy velvet lips
The honey-bee his richest nectar sips.

You praise them with no tepid words; but, hush!
The rose that charms me most is none of these.
I call it in my thoughts the Maiden's Blush;
Its tint is deepened by each vagrant breeze,
And yet—and yet it is not far to seek,
But blooms in beauty on my lady's cheek.

E. MATHESON.

Chambers's Journal

SEVENTH SERIES

AN ACT OF GOD.

By ROBERT MACHRAY,

Author of *The Glory of the Gallery, Life of Archbishop Machray, &c.*

HE was only a lad at the time, and therefore too young to do much more than grasp the bare facts which are about to be related. It was the wonder of them, rather than their why and wherefore, that impressed itself upon him and filled his soul with amazement. It is the wonder of them that still holds him, although he is now on the verge of threescore, and often has he speculated why these things were so. The bishop, a learned man and a wise, could not tell him the reason. Perhaps the bishop, dead some years past, knows it now; but then he spoke of 'an act of God,' as is the current English legal phrase, and the lad left it at that.

Here are the facts.

An army came marching, marching from the unknown, mysterious north to the sparsely inhabited south. A mighty army it was—not a thousand, nor a hundred thousand, but uncounted millions strong. Neither the bishop, albeit he had been a high wrangler at Cambridge, nor any other man could number it, for it was literally like the sand of the sea for multitude. Ever it marched, without hurry, but without a halt. Night succeeded day, yet this army never tarried, never slept. On it moved without pausing, with its face always to the south, inexorably bent on its predetermined goal.

When it came to rivers or the narrows of lakes, it bridged them with bodies, and passed over; when it reached a sheet of water that was too large, it went round the shore till its march was due south again. It appeared to have no leaders, but it never lost the route. It displayed neither flags nor banners; no stir of bugles, no beat of drums, rose from its ranks. Indeed it marched in an absolute silence which was weird, intimidating, and more impressive than any military music.

Out of the dim north the army poured as if it would never stop and had no limit; its innumerable regiments passed on, and regiments as innumerable took their place. As it advanced it shed its dead and dying, like trees their leaves in autumn, but its gaps were instantly closed up. Soon it covered the entire expanse of the country as the waters cover the bed of ocean; it left no spot of soil unoccupied, east or west, for hundreds

of miles. And as it moved, and kept on moving, it devoured and devastated the land, the very shape of which seemed to change.

The year was 1875, and the season was summer. On the great prairies the heat was almost tropical. All day long a burning sun blazed in a cloudless sky, and every night the stars shone splendid and serene in fathomless depths of blue. The land was Manitoba, a 'new country' then, and the incalculable army that was marching over it was composed of locusts, or grasshoppers, as the settlers called them.

In the preceding year an advance-guard of these invaders—also uncounted millions strong, but insignificant compared with the hosts that came after it—had marched through the province, then in the first days of its history, and had left a wide track of ruin; but when the army itself came it took the whole territory, and, turning it all into one vast highway, made it at the same time one far-stretching scene of unparalleled desolation. No plague of Egypt ever was more sweeping or more terrible. Men's hearts, even the stoutest, failed and fainted within them.

When this army of locusts appeared the lad looked on; and, being but a lad, he wondered. He had heard of the 'grasshoppers'—the bishop rightly named them locusts—and the havoc they had wrought in the previous year and in earlier times; but having been in the settlement only a few months, he had not beheld them before. In other lands, however, he had seen the ordinary grasshoppers that chirp and leap in the fields, and had caught and used them as bait for fishing. In their curious structure and colouring of bright green and glancing bronze those harmless insects closely resembled these destroying locusts, but the latter were twice the size of the former. The grasshoppers jumped from place to place as if on springs; the locusts marched with their legs, line after line, an army in motion; and as they marched and ate up the substance of the country, they grew and grew until many of them were more than an inch in length.

Early one morning the lad came out from the college—the White School on the Red River—in which he and the bishop were living. It was vacation, and the students and boys had gone

home for the holidays. Wherever the lad looked he saw locusts, nothing but locusts, marching, marching south. The surface of the ground was carpeted with them—a living, moving carpet of green and bronze. As he gazed the earth itself seemed to be moving and working on to the southern horizon. It was the strangest spectacle—like a thing witnessed in some wild and disordered dream. But part of this was no illusion. The lad stepped into the open, and wherever he set his foot he crushed and killed as many locusts as the sole of his boot covered. He went on a short distance, and it was the same. Then he ran back, the creatures squelching pulp beneath his feet, to tell the bishop. Here, surely, was the most wonderful sight in the world!

Blind to the wonder, the bishop looked on the marching hosts; and, seeing but the wreck of many hopes, he groaned in spirit and sighed aloud. He was a tall, dark man, with fine gray eyes and heavy black moustache and beard; a grave, capable, forecasting type of mind lay behind his high, domed forehead; his courage was indomitable, but his expression sometimes was a little wistful and anxious; and he never spoke much. He had no gift of eloquence, but he was a marvellous ruler of men. His confidence in the country was immense; he was wont to declare that there were no bounds to its future. He loved the land, and loved its struggling settlers, who in their turn believed in it and him; they held him great, for had he not brought them safely through the rebellion five years before, not one life being lost? That morning, as he looked with the lad on that army of locusts, the light went out of his face, and left it melancholy and sad. There had been the promise of a magnificent harvest to reward the faith and the toil of the new community; now all was over. Profoundly dejected, the bishop turned away, walked slowly into his study, and shut the door.

At intervals all that first day of the locusts the lad watched with ever-increasing wonder this mighty, irresistible army, which no man might number, on its unresting march to the south. He went out on the plains, and saw how the tall grasses had been shorn to the roots and consumed. He went into the fields of growing grain, and saw how they were laid bare; blade and stalk had disappeared. He went into the garden on the far side of the college, and saw how plants and flowers and young trees were wasted and devoured, so that what had been the bishop's delight was turned into desert. He went to the bank of the river, and saw how the broad stream was bridged with the bodies of locusts, and the apparently undiminished hosts passing over as if on dry land. And, as before, wherever he went he crushed and killed as many of the creatures as the soles of his boots covered. Day passed, evening came, night fell, and the stars shone clear; the great army was still marching southwards in that unbroken and uncanny silence.

Much of that day and night the bishop spent in his study, with the door shut. One may guess what were his thoughts, and how he was engaged in that room. Never could he believe, never did believe, that this was the end; never thought that the goodly land he loved, which so evidently had been made for the use of man, was to be hopelessly given over to this overwhelming invasion, although, before it, men, their strength and their knowledge as naught, were as impotent as babes. Yet all around was this hideous and seemingly senseless ruin! Other years of the locusts had there been—visitations, he called them; but none so calamitous as this. Were the years to come to be the same? Was the land condemned to suffer from this plague perpetually? He might well have despaired, but he did not despair. He was not the kind. 'This shall yet be a great land,' he had said, and he said it still.

Shortly after daybreak next morning the lad went out again from the college into the open country, and he saw there was no change. The mighty army, uncounted millions strong, was marching, marching south as on the previous day. The whole surface of the ground, as far as the eye could reach, was still covered with the hosts of green and bronze—a living, moving carpet; and again it seemed as if the land itself were in motion. At breakfast the lad eagerly asked the bishop many questions. Whence did these locusts come? What gave them birth in such incredible numbers? Whither were they going? Was there no way of fighting them and causing their overthrow? What purpose did they serve? What was the why of them? As was his habit, the bishop, who looked weary and sad, spoke but little. It was all a very great mystery, he said, from every point of view. In brief, it was 'an act of God.' The lad wondered more and more. 'This plague will pass,' said the bishop finally.

All that day the hosts of locusts, ever pouring out of the north, marched on southwards, devouring and devastating the land. The night that followed saw them still marching, marching on. The next day and the next night it was the same. No change! The lad looked on, and wondered at the numbers of the locusts and the havoc they worked. Scarce a green thing was left, except on the high trees; shrubs and bushes stood stripped and naked; even the hard, tough bark of the tall oaks, poplars, and maples had been attacked and eaten off near the ground in rings several inches wide.

The main building of the college formed three sides of a quadrangle; its front faced the south; its back and its wings, running east and west, lay to the north, and in the space thus contained the locusts piled themselves many feet deep, as if in a determined effort to scale the edifice. On the third day, and all that day and the next, the bishop had wagons carting the bodies of the

creatures away to the river, for the accumulation of the multitudinous dead threatened human life. Millions upon millions were carried from that small space, which, to the extent of the country, was no more than a drop of water in the sea. And the army never ceased marching, marching on.

Pallid and terror-stricken, the bishop's people came in from their homesteads on the plains, and told him of the spreading ruin. Their crops were gone; the streams and pools and little lakes were becoming foul; their cattle and even the wild beasts of the woods came calling lamentably for food. How were they themselves to live in this dreadful land? They were only a handful of men, with their poor homes dotted here and there on the great wide prairies; their lot was never easy in those early days; but life was dear to them, and they had their wives and children. Were they to droop and die? Was Manitoba indeed a fated land, a land under a curse? The bishop was a man of few words. His heart was wrung for his people and the people of the province, for their plight was woeful and desperate. He himself was weary with thinking and praying, but his faith was strong. 'This plague will pass,' he said; 'this land shall yet be great.' Also, he fed them, gave them what provisions he had, and sent them away comforted.

The fourth day and the fourth night came and went, and the hosts of the locusts never ceased marching, marching on, still countless millions strong, ever pouring out of the north, ever moving south—as in the beginning of the invasion. But on the morning of the fifth day, lo! a wonder of wonders! It may have commenced in the night—who knows?

By this time the lad had grown tired of looking, for the sight of the mighty army on the march had become familiar. On that fifth day he did not go out into the open until after breakfast; the sad-faced bishop and he had eaten that meal almost in silence. 'There seems no change,' said the bishop sorrowfully. 'No,' said the lad; 'it's just the same as it was yesterday, and the day before, and the day before that, and the day before that again.' But it was not quite the same; a change there was, though neither of them knew of it at the moment.

Breakfast over, the lad went out from the college, and his quick young eyes soon noted that while the hosts of the locusts were still marching south in the same appalling numbers, they appeared to have lost something of their momentum and cohesion. Something, he understood, had happened, was happening! He looked and looked again at the army of green and bronze that covered the earth like a carpet. Had it been an army of men, one might have said that its *elan*, its spirit, its solidarity, were vanishing. 'It may be,' the lad surmised, groping in his mind for an explanation, 'that, having eaten up the land, the locusts are famished from lack of

food; for this army, like every other army, must "march on its belly." They are hungry.' And then he looked closer; he stooped to the ground, and now saw what he imagined was the true reason for the difference he had perceived in the onward movement of the invaders.

It seemed to him that the creatures were actually tumbling to pieces, or had gone through some action—a veritable battle! The latter appeared the better guess, for nearly all he examined had lost legs or parts of their bodies, as if they had been shot off. And then, going into the matter more narrowly, he saw the real cause. This was the wonder of wonders, the miracle that has never been explained. He looked and looked, ranging over an area of many yards, picking up hundreds of the locusts; in almost every instance the same extraordinary thing was to be seen. On the frame of every insect so affected were to be observed two, three, and sometimes four spots, each the size of the head of a pin, of a deep-red hue, burnished and glowing like a ruby in the sun. They were living jewels of death!

Whence, he asked himself, had come these spots of bright colour on the uniforms of green and bronze in which the locusts were arrayed? What did they portend? What were they? On the previous days there had been nothing of the sort. What had they to do with the invaders? The lad touched the spots curiously; he pulled them off the locusts' bodies, and found they were embedded in the flesh of the creatures. Then the knowledge broke on him as an intuition, afterwards confirmed as a fact, that these spots of red were also living creatures, and that they in their turn were devouring the devourers of the land. Hence the mutilated bodies of the mighty army on the march!

He ran into the college, full of the discovery, and told the bishop. Here was something even more wonderful than all that had gone before! What were these living spots of red? The conquerors of the conquerors? The lad set forth his belief that the locusts were being eaten up alive by the red spots, as he named them.

The bishop was not a naturalist, and he could not pronounce what the red spots were. Perhaps no naturalist had ever seen such spots before, and it may be that no naturalist has ever seen or will see the like again; there may be nothing precisely similar in the world. But he, too, looked and looked at the red spots; they set aflame the hope that had never ceased to burn in his soul. He said nothing, but went out with the lad, and like him saw that the mighty army no longer marched as on the preceding days; still, it marched, but it was as if it were staggering, uncertain, uninspired. He saw that everywhere near the college the locusts dropped in their tracks with the red spots clinging to the remains of their bodies; where they fell, there they lay, locusts and red spots together! With the lad he walked

out on the prairie and into the fields, and everywhere was the same thing. 'It is as you say,' he remarked to the lad, with a shaking voice, but with a face that was lighted up again; 'the locusts are being eaten up alive by these red spores, or parasites, or whatever they may be called.'

All day this strange and inexplicable slaughter of the invaders went on. So far as human eyes could see, the locusts offered no resistance; simply they marched, carrying their conquerors, until they could move no farther, and then lay down and died in their uncounted millions, the red spots dying with them. By the evening the larger part of the mighty army had perished. Next morning there was not a locust of all these innumerable hosts left alive in the land. Neither were there left alive any of the red spots; for, having done their work of destruction, they also died. A fine, almost impalpable grayish-green powder, faintly touched with red, and dry as dust, lay on the plains. That was all that remained of the army no man might number, and of its conquerors—dust! And the winds of heaven swept it away.

'An act of God,' said the bishop. 'The plague has passed, and it may never come again.'

'An act of God!'" repeated the lad in wonder. 'The coming of the locusts and their ruin of the

land for the time was an act of God—so you said to me. And the coming of the red spots and their killing of the locusts also was an act of God. Why are these things so? I do not understand!' cried the lad, challengingly.

'Neither do I understand,' said the bishop humbly. And he went into his study and shut the door.

This is the story of the passing of the plague of locusts from Manitoba in the year 1875, a plague of which there has since been no return. It is a true story. The bishop is dead; but I who write it, thinking that in its way there is no more remarkable or memorable story in the world, was the lad. And with it may be compared the ancient but not more wonderful story of the locusts in the tenth chapter of Exodus.

[The bishop in the foregoing was the late Dr Machray, second Bishop and first Archbishop of Rupert's Land (Manitoba), and first Primate of All Canada. The writer, a nephew of the Archbishop, is the well-known novelist. He was formerly a canon of St John's Cathedral, Winnipeg, and a professor of the University of Manitoba. The North American locusts are not, it should be said, of the same species as those of Palestine and Cyprus.—Ed.]

ATLANTIC GOLD.

CHAPTER XIV.

THE letters that Anstruther received with considerable irregularity from his friend not only informed him of much futile racing and chasing, but illustrated the beneficial effects of travel, however vain in itself, on a mind disposed to obsession by a solitary grand idea. From mere passionate outbursts of disappointment and anxiety, the letters gradually became calm statements of experiences undergone and sober repetitions of a determination not to abandon the search. Then followed notes of hope or despair, but with an entire absence of excitement. Still later, the letters contained items not directly relating to the writer's self or the object of his search. These were followed after a longish interval by a few lines, mentioning a visit to the theatre. Thereafter picture post-cards. But the heart knoweth its own bitterness. Arcus, Anstruther guessed, had simply taken to keeping his feelings to himself.

At the end of five months he returned to London, having covered innumerable false scents in the States and Canada, and having searched in all the Continental cities he could remember Florence mentioning.

'I won't give in,' he told Anstruther. 'I have four detectives working for me. The world sha'n't hide her for ever. I start out again the day after your wedding, old man.'

'We had hoped you would wait for our home-coming,' said Anstruther's fiancée a few hours later. 'It won't be right without you.'

'And you the groomsman!' said the lady's younger sister, a pretty, slight creature who could not understand why this young man should go rushing about the outer world when London was at its best.

Arcus was not to be persuaded. And the day before his friend's wedding he received a letter from the manager of the whaling-station. Among other things it said: 'One of my gunners reports smoke on Laskeir again.'

Arcus wrote a line to Anstruther, had a lengthy interview with his lawyer, packed a bag, and just caught the eight-fifteen night train from King's Cross.

Laskeir! The last place he would have dreamed of!

Three days later, landing from a whaler's pram, he received the grave salutation of Hubert.

'Miss Helmsdale?'

'At the Woman's Cliff, sir,' replied Hubert, now a man of few words and sorry eyes.

That was all. Apparently the two men were not interested in each other. With a nod of thanks, Arcus went his way.

A small house had been erected on the old

site; many traces of ruin yet remained. In the doorway an elderly woman with a dull, heavy face stood knitting; for a moment she stared at the stranger, then dropped her eyes to her pins and wool. Years after, Arcus could remember that the wool was a mingling of scarlet and white.

It was a gray day, but warm for May. Yet Arcus experienced a sense of chilliness as he climbed. Weariness, perhaps; for the thought of seeing Florence again—the possibility of really finding her on the island—had given him no rest. His heart beat with a wild eagerness.

At last he beheld her. She sat, chin on clasped hands, gazing out to sea. She was dressed in white blouse and short skirt, fresh and trim, as at their first meeting; but her high boots, he noticed, were worn and shabby. It was surely curious that he should at first glance notice such a detail. An agony of pity caught him as he realised that she had grown thin, that her face had rather a pinched look. He had to wet his lips and swallow twice before he could speak.

'Florence!'
